MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

An Illustrated Journal of Mining, Mechanics and Popular Science

VOLUME LXIX. Number 1. SAN FRANCISCO, SATURDAY, JULY 7, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

PLACER MINING IN ALASKA.

"Plenty of room in Alaska," says a citizen of Juneau. Then he goes on to illustrate a country as large as that part of the United States east of the Mississippi, inhabited by a white population about equal to that of Woodland and a total population equal to Sacramento. In round numbers these people buy two million dollars' worth of goods and sell eight million dollars' worth of products annually. Plenty of work here and good results.

Placer Mining.—Although it cuts a small figure among the great interests of Alaska, placer mining is now attracting most attention from the public. As usual, the center of attraction is the most distant field, away off near the great bend of the mighty Yukon, where it is almost under the Arctic circle and can be called the land of the midnight sun.

THE QUEEN AT TREADWELL'S WHARF, JUNEAU ON THE RIGHT, DOUGLAS ISLAND ON THE LEFT.

It has been very hard to obtain the latest information from that region or to locate the new mining camps, for there is hardly a man in the city who has ever been there. It seems that the last one of them has gone back to the diggings. From 350 to 500 went in this season over the Chilcat Pass from Juneau. Others remained there another winter, and it is estimated that one thousand miners and traders are now in the valley of the Yukon.

Those who enter by way of the pass generally take a small outfit of tools and provisions weighing 500 to 700 pounds, and expect to reach the diggings after five or six weeks of climbing mountains, sailing across lakes and sliding down the current of the river, shooting two or three rapids and making a few portages.

Monopolists.—The Chilcat Indians have long claimed a monopoly of the overland route to the Yukon, and charge $15 per cwt. for packing to the summit of the pass.

Then it is customary to build a boat or raft on the shores of Lake Lindeman to carry the load to the mines.

Lieut. Schwatka in 1883, had a raft about 12x30, that he afterwards enlarged to 14x42, and carried his outfit nearly 130 miles.

He was forced to make a few portages and there were many difficulties to be overcome. The raft was a simple affair made of small logs fastened together with wooden pins.

Stores at the Diggings.—Forty-Mile Creek is the metropolis of the Yukon diggings. There is a store supplied from St. Michaels by the Alaska Commercial Company, and kept by L. N. McQuestin, who entered the service of the Hudson's Bay Company about 40 years since, and who now carries a stock worth $125,000 to $130,000.

Mr. Healey, who formerly kept a miners' outfitting store at Lynn Canal (where they leave salt water to go over the Chilcat pass), has interested a Chicago syndicate to ship goods from Seattle to the mouth of the Yukon by sailing vessel, and thence by small stern-wheel steamer to his new store at Forty-Mile Creek. In an interview with Richard McQuestin, a twelve-year-old son of the pioneer, who is here attending school, he informed the MINING AND SCIENTIFIC PRESS that Mr. Healey has rather a larger stock than his father.

The river boats charge $5 per cwt. freighting goods up the Yukon, and the captain of the Bertha informed us that the Alaska Commercial Company charges 50 per cent in addition to the wholesale price at San Francisco as their price to dealers at St. Michaels. This is their distributing point near the mouth of the great river.

Their representative informs us that goods retail at the mines on the Yukon at about same rates as other remote mining towns on this coast. Goodall, Perkins & Co., in their pamphlet "All about Alaska," quote what is presumed to have been McQuestin's prices for '93:

Flour	$17 per cwt.
Bacon	40 " "
Beans	20 " "
Sugar	33 " "
Dried Fruit	25 " "
Butter	75 " "

With larger stock and active competition it is fair to presume that prices will rule lower for the season of '94.

School at the Mines.—Young McQuestin says that Forty-Mile Creek (or Mitchell, as the postoffice is called), has about 300 people. Of these, 75 are school children and 10 or 12 of them are white.

They had six saloons when he left home last August.

As many who went in this spring from Sound ports and from Juneau follow that line of business, it is fair to presume that things are lively by this time, and that the "'49 Mining Camp" is acted out in real life. There is nothing in the Governor's late report to indicate that they have ever had any law on the Yukon, and very little in other parts of Alaska. We may guess that they are a law to themselves and that gold dust is safe.

Capt. Carroll, of the excursion steamer Queen, kindly favors us with a letter from his old friend Aylward, well known at Juneau and about the Treadwell mine:

FORTY-MILE, YUKON, January 15, 1894.

FRIEND CAPTAIN CARROLL:—For old friendship sake I thought I would let you know my whereabouts, hoping you are well as your humble servant is at present. I had no desire to come to this place, but I am not hard to bluff when there is a lawsuit in view; however, I am not sorry, as this is a better country. There is really nothing known as yet how extensive the gold is here. I must say men who have been here for the last five or six years have made poor use of their time; however, there has been no grub in the country up to the time Healy came. His scheme is a good one and he ought to do well. Now, friend Captain, I believe I made the grandest discovery last summer that was ever made in this Yukon country, and in coarse gold I got as high as $13 to the pan. The gold is like pumpkin seed, but some pieces weigh $3, $4, $6, $8 and $10; but I think $40 or $50 will be a common thing when I get the claim opened up. Why, Captain, I would get $15 or $20 under a little stone where I could find bedrock. I will send you a nugget next fall when I get one that will suit.

Captain, I did not leave Juneau broke. I had about $2000 when I left there, and it was quite a help to me. If I had to rustle for grub I would not have made the discovery. I have seen no quartz as yet that I want. If I ever do, I will not forget you. I wish you would send me something to read by Healy or the Alaska Commercial Co. boat. Good-by, Captain! Your friend, ED AYLWARD.

This looks like a pretty big story, to a tenderfoot, but it has been a source of considerable amusement to read it to old miners and see the blood tingle in

(Continued on page 6.)

Table of Contents.

ILLUSTRATIONS.—The Queen at Treadwell's Wharf, Juneau on the Right, Douglas Island on the Left, 1. Friction Drum Electric Hoist, 4.

EDITORIALS.—Placer Mining in Alaska, 1-6. The Chilean Exposition; Mariposa as a Mining County; Miscellaneous, 2.

MISCELLANEOUS.—Concentrates; Personal; Clipped and Condensed, 3. California Borax Mines; Friction Drum Electric Hoists; Fifty Millions in Silver; A Western Nevada Mining Camp, 4. The Mineral Hydrocarbons; Copper Mining; Mines on the Lower Colorado River; New Laws for Mercur, 5. The Ivanhoe Tunnel; Items, 6. The Official Awards; Book Notice; Government Whitewash; Electrolysis Neutralized; Australia's Gold Fields; Items, 7. Recalling a Mailed Letter, 8. Balking the Umbrella Thief; Items, 9. Coast Industrial Notes; Patents, 11. The Patio Process in Mexico; Items, 12. Emigration from the United States; The World's Gold and Silver Production for 20 Years, 15.

SCIENTIFIC PROGRESS.—Tide Wells in the West; The Earth's Motion Made Visible; Some Coming Electrical Wonders; All Metals Have the Same Degree of Conductivity at Zero; Gilbert Theory Concerning the Moon's Face, 8.

MECHANICAL PROGRESS.—Boiler Testing; The Great Cost of Cable-Laying in New York Streets; Heating Iron in Cold Water, 9.

ELECTRICAL PROGRESS.—Electricity in Iron and Steel Works; Items, 12.

PRACTICAL INFORMATION.—How Granite Columns are Turned; The Construction of a Coat and Vest Requires a Deal of Labor; Modern Explosives; Items, 13.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 10.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 14.

With this issue, Number One of Volume Fifty-nine, the Mining and Scientific Press appears in a new dress throughout.

The "Midwinter" fair which extended into midsummer has officially closed. Opiuions differ as to its utility and result. That it was a financial success in these times of depression is creditable to the executive ability of its projectors; that it has been a good advertisement of the State at large is obvious. It is believed that its greatest good and most material benefit lie in the larger acqnaintance made by State residents of the extent and resources of the commonwealth, and the resultant increase in State pride and progress.

An instance of extreme couservatism is afforded iu the great demand for Mexican silver dollars in India, China, Japan aud Singapore, 25,000,000 being aunually exported from Mexico to those countries. More than a generation ago there was a lack of native coiuage and American traders happening to get hold of some kegs of Mexican dollars introduced them. That coin became "naturalized" iu the Orient, and in spite of the local coiuage it is iu constant demand. Another singular fact in connection with the eagle dollar is that though it is intriusically worth more than the American silver dollar, yet, to pay a debt that 100 American silver dollars would pay in this country would reqnire 203 Mexican ones.

THE CHILEAN EXPOSITION.

The coming exhibition at Santiago opens September 1st. The Acapulco leaves here uext Monday, carrying considerable from this city for exhibition there. The Union Iron Works sends a five-stamp iron frame battery gold mill complete; the California Powder Works, dynamite; the Selby Smeltiug Co., lead and tin pipe; Palmer & Rey, a mining hoist; Paraffiue Paint Co., roofing paper, pile coveriug and electrical insulators; J. Hendy Machine Works, hydraulic mining machinery, ore wagons, whim and water gates; F. A. Huntington, roller quartz mill complete; G. E. Woodbury, concentrators; Union Gas Engine Co., 12-horse power gas engine; Pelton Water Wheel Co., water wheels and motor; W. W. Montague & Co., iron pipe.

W. C. Quinby has charge of the above, and goes ou the Acapulco to remain during the exhibition, which lasts four months.

MARIPOSA AS A MINING COUNTY.

All along the foot-hills of the Sierras, embracing in its scope the entire gold belt of California, for the past two years there has been a manifest revival of that productive industry upon which was founded the prosperity of the Pacific Coast. The initial movement which awakened a renewed interest in gold mining was made by the Miners' Convention in January, 1892. It may be said of that body that "they builded better than they knew;" for, though their immediate object was the rehabilitation of hydraulic miues, it incidentally attracted attention and gave a healthy impetus to the quartz mining industry from the Oregon line down to the Mexican border. Mariposa is only occasionally heard from. It is forty miles from the nearest railroad, without telegraphic facilities and, from these and other local causes, has fallen into the habit of trailing along in the rear of the processiou. Recently the old county has been showing symptoms of vitality. "Faint signs of life," says a correspondent who writes hopefully from the county seat; and another claims that "the prospects are more encouraging than at any period since the flush times which practically faded out about the year 1870."

It will be remembered that, in the early stages of quartz mining, the appliances for hoisting ore aud pumping were crude. The same may be said of the methods used in blasting and milling. The old Mexicau arrastra was not yet obsolete. Giant powder and Burleigh drills were unknown. As a rule, the mines were richest in free gold near the surface. Whenever the lode ran into low-grade ore or sulphurets requiring processes for handling not then in general use, work was suspended aud the general opinion was expressed that the mine was "worked out."

It has been long ago demonstrated that it reqnires a healthy capital and skilled management to profitably operate a gold mine to any great depth.

Placer mining, as a means of makiug a bare subsistence even, is hardly recognized—the chances there being very few and far between; so the occnpation of the old-time miner is gone. Occasional pockets, in decomposed quartz, are struck by prospectors, but as the years roll on, the chauces of success in this precarious occupatiou become more infreqnent. The change in conditions places gold-mining here upon the same basis as the great producing mining properties of other localities in California and adjacent States and Territories. It has become a business proposition involving the investment of capital and techuical skill.

It is safe to say that there are few better fields in this State for mining operations thau old Mariposa. Several erroneous impressions have goue abroad regarding this couuty which have had a tendency to retard enterprise. Men without experience in the business have purchased properties upon the representations of alleged "experts" who knew nothing of miues nor of miuing. Immense outlays have been made iu mills aud machinery upon gilt-edged reports. Villages, hotels, warehouses, assaying works have been constructed on surface indications till the men who were furnishing the coin became weary and quit before real, practical work had commenced. The connty abounds with the debris of these monumental failnres. This statement applies to nearly every mining district iu Mariposa county including the Fremont grant sometimes known as "Las Mariposas."

Without going into details as to the changes of ownership and manitold phases of manipulation of this property, a glance at the preseut conditions involves a brief retrospect—premising that people who have had no opportunity of personal observation make the mistake of confouuding this patch of 44,000 acres with the entire couuty. Outside of the State of California this miscouception of the territorial condition is nearly uuiversal, while the same error prevails in distant localities withiu our own borders. It may be here meutioned that the "grant" comprises less than one-tweutieth of the entire area of Mariposa. It does, however, contain some valuable mines. It iucludes within its scope the towns of Mariposa, Bear Valley, a remnaut of Princeton, and several other sites of towns which have a sort of shadowy existence in tradition and history. Its northern boundary is the Merced river, aud it extends, in an irregular form, southerly, to a line about three miles south of the town of Mariposa. The principal mines, which were successfully operated by some of the former owners and gave a world-wide reputation to the property, were the Josephine and Pine Tree at Bear Valley, the Mt. Ophir, Greeu's Gulch, Princeton and Guadalupe, near the town of Princeton, and the old Fremont mine, near the town of Mariposa. Work on an extensive scale was suspended all along the line uearly twenty-five years ago, the shafts and tunnels having caved in, the mills have been dismantled and machinery rusted and ruined by exposure and disuse. In 1887 it was purchased by a syndicate of mining men, consisting of Flood, Mackay, John P. Jones and Hobart & Hayward, who subsequently incorporated under the name of the Mariposa Commercial and Mining Company, represented at present by John P. Jones, Sam Jones, Alvinza Hayward, the estate of Hobart and Johu Mackay. There were some good reasons for believing that work would be commenced on a grand scale, but something intervened and the mining operations up to date have been limited to prospecting. James Cross was manager of the property for three or four years, and under his superintendence the Pine Tree and Josephine mines, near Bear Valley, were opened up aud thoroughly explored. The results, so far as known, were satisfactory, but the freshet in the spring of 1890 swept away the Benton mill dam, and with that, the power which ran the Burleigh drills, and prospecting in that locality was suspeuded. There was the usual amount of current rumors afloat about the intentions of the owners but in one form and another, since the survey of a dispute for a miuing ditch nearly forty years ago, these rumors have been circulated with the regularity of the eqniuoxes, till they have come the precession of stale and harmless jokes. About be tolerated as two years ago Mr. Cross retired from the mauagement aud is now attending to the estate of his old personal friend, Hobart, deceased. Since that date until quite recently nothing has been done.

The latest advices are to the effect that permits have been given to miners, under certain conditions, to prospect within the boundaries the "grant"—the compauy retaining a royalty in case of discoveries of paying mines. A. C. Hamilton, familiarly known to mining men in California and Nevada as "Lon" Hamilton," succeeded Cross as manager. With the exception of the encouragement of prospectors above referred to, no change in the policy of the owners has been made. If any great mining operations are contemplated—such as will involve the construction of a dam on the Merced, the transmission of electric power for runuing mills aud hoisting works, or a tramway or narrow gauge road conveying ore (either of which propositions might be a factor in the thorough development of the property)—then the owners thereof are not advertising their plans. A small quartz mill has been erected in Missouri gulch, about a mile from the town of Mariposa. This is within the lines and on the list of individual concessions. It was completed late in the season last year, the origiual intention beiug to run by water power. An overshot wheel, or some motive appliance akiu to it, was constructed, but a serious trouble intervened. For nine or ten months of the year there is hardly water euough available iu that locality for domestic purposes. In the summer months two pack mules, a saddle horse and a thirsty man drink Missouri gulch dry, and iu seasons of great drouth there is only one spring within a mile of its south where even a drink can be obtained. These facts dawning upon the builders of the mill after awhile a small engine was purchased, steam power substituted, and the mill moved. The projectors of the enterprise are engaged in crushing quartz iu "lots" for prospectors, and the cheerful rattle of the stamps awakens the inhabitants in time for breakfast, aud gives a cheerful tone to the town and its surroundiugs.

"It is a little five-stamp trick about the size of a deuce full," remarked a sportive mountaineer from the "Butterfly county" iu describing it to a group of his acquaiutances as they sauntered through the mineral department at the Mechanics' Fair and gazed admiringly on the collection of ores from Mariposa; yet it seems an admirable purpose for testing ores by a milling process, reckons the pulse of expectant people and furuishes occasional item for the local paper.

Concentrates.

DENVER banks are reported paying a premium on gold.

THIRTY-FIVE men are engaged in placer mining in and around Susanville, Or.

WORK has been resumed upon the Rose Rock mine at Indian Creek, Calaveras county.

THE Stockton *Record* complains that the lotteries take $5000 every month from that community.

THE Griffin Gulch Gold Mining Company has been organized to develop placer mines near Baker City, Or.

AT THE Julian (San Diego county) mine the ore averages $10 a ton. It costs $4 per ton to mine and mill the ore.

THE carbon reduction method of gold extraction will be given a trial in a $200,000 plant now building at Florence, Cal.

THE new copper smelter at Salt Lake is at work on 6,000 tons of ore from the Copperopolis mines in Box Elder county, Utah.

THE Brown's Valley Gold Mining Company has incorporated; principal place of business, San Francisco. Capital stock, $100,000.

FIVE HUNDRED DOLLARS' worth of plates were recently stolen from Heald's mine in Nashville and brought into Amador county.

THE New York mine, near the W. Y. O. D., and the Greeley Blackman mine, on Deer Creek, Nevada county, will shortly be reopened.

THE Gopher-Bowlder mine at Kelsey has been sold to W. A. Bell, who is also negotiating for the Delmatia and St. Lawrence mines.

THE Hartford Mineral Land Development Company, capital stock $100,000, proposes to develop several quartz ledges near Loomiston, Wash.

THE World's Fair Gravel Mining Company, principal place of business, Nevada City, capital stock, $1,000,000, has filed articles of incorporation.

EIGHTY MEN are now working the Mahala mine at Leadville. Two hundred tons a month of sulphide ores are taken from the shaft in the carbonate contact.

THE Tennessee mine, near Kingman, Arizona, is shipping 10 carloads monthly through that city to Pueblo. The ore runs nearly 70 per cent in lead and 20 ounces in silver.

SUPERINTENDENT STAUNTON of the Congress mine, Arizona, says that a new water supply has been developed at the mill, and the forty stamps are running night and day again.

FIVE Spokane prospectors have started to the Clearwater river to spend the summer hunting gold and, if possible, to seek the body of Colgate, the lost guide of the Carlin party.

THE Elko *Independent* says there are a good many miners going into the Bruneau and Mardis country from Deetb. Loads of merchandise and machinery are leaving there nearly every day.

THE 191st regular monthly dividend of the Homestake Co., of 15 cents per share ($18,750,) was paid on the 25th ult. The total paid to date is $5,175,000 and this from ore averaging less than $3 per ton.

THE Rio Grande smelting works at Socorro, N. M., have been closed down owing to the low price of silver, the difficulty of procuring Mexican ores, the low charges of treatment of ore and the coal strike.

HARRY DOUBLEDAY, one of the owners of the Gold Note mine in Kennedy, has returned to Winnemucca from San Francisco, where he came with a carload of ore to have worked. He is well satisfied with the results.

THE little town of Mogollon, in the Mogollon mining camp, 80 miles northwest of Silver City, N. M., was almost destroyed by fire last Sunday, only two business houses left standing. The loss is estimated at $75,000.

ALVINZA HAYWARD, Superintendent Lane of the Utica mine and Mr. Cross, administrator of the Hobart estate, have bonded the Gover mine on a ninety days' trial, and the *Record* says work will be commenced soon.

THE water is too high for the use of placer machines at the San Juan placers. With rockers men are taking out from $3 to $6 per day; one man took out $76 in 12 days. The ground is staked for 50 miles along the San Juan river.

THE mining property reported to be bought by Jim Wardner is the Imperial mine, mill site and water right in Kennedy district, Humboldt county, Nevada. He must have a mill of at least ten stamps in operation by September 22.

THE Penrose mine in Leadville carbonate district is again in operation with a large force of men, who had been laid off while repairs were under way. Since it started up two years ago the shipments from the Penrose have been simply enormous, some months running as high as 4000 tons.

SUPERINTENDENT COX and party of eighteen persons are at Cinnabar, Trinity Co., to reopen the Altoona quicksilver mine, situated in the northeastern part of the county. This property has been in litigation for a number of years, the suit having been decided last year in favor of the present company.

A GANG in this city are turning out counterfeit half dollars, made of pure coin silver. The silver in a genuine half dollar, measured by the gold standard, is worth twenty-four cents; it weighs 900 grains fine; the counterfeit weighs 825. On each piece the profit is twenty-six cents, and till caught the trade is a thriving one.

MANY miners who have been waiting for work at Basin, Mont., have gone into the hills to work on placer mines. All report that they are doing well, especially during the high water. Winters and Brown are taking out considerable gold on the headwaters of Basin creek and they expect to clean up $10,000 for the season's work.

EX-SENATOR H. A. W. TABOR of Colorado has gone to the Vulture mine. This famous property has already produced $7,000,000, and for the past three years was leased and but 10 stamps were running. The lease has now expired and Tabor says the mine will be worked extensively when the Santa Fe, Prescott and Phœnix Railroad approaches nearer.

THE Loomiston *Journal* says that at Conconully a vast placer deposit exists which can be easily worked by a hydraulic process of moderate expense. "Graveyard Flat," a bank from 100 to 200 feet high, commencing a mile south of town and continuing for three miles, has a bank on which a shaft has been sunk 55 feet. Ten feet below the surface occurs a stratum of colored sand and gravel which continues down for nearly 14 feet. Panning from any portion of this immense stratum, the gravel has averaged 25 cents per pan, or $25 per yard. This is a good sized story, but may be true.

THE Baker City, Or., *Democrat* says: There is a certain class of miners to whom rioting and fighting is more congenial than work. Many a good man has pounded a hammer on the same shift with such men, and felt all the time that a rule which gave them the same wages he earned was a damnable rule. Hasn't every decent miner had the same experience?

THE loss occasioned by the four months' strike at Cripple Creek, Col., is figured this way: Loss to labor, $285,000; loss to merchants, $60,000; loss to freight, $35,000; loss to dividends, $200,000; to which add the cost to El Paso county in furnishing deputies, etc., $150,000, and cost to the State in calling out the militia, $150,000, making a total of nearly $1,000,000.

REPORT comes from Osceola to the White Pine *News* that the Cumberland and Osceola Gold Mining Company's mill has been shut down and that the cyanide process is not satisfactory there. Had the rock been crushed finer and afterward passed over plates a success would have been scored. Fine bodies of rich gold rock are at present exposed in the company's mines.

DURING June there were coined at the U. S. Mint in this city $1,365,000 in 20's, $150,000 in half dollars, and $84,205 in quarters. During the fiscal year ending June 30 the coinage at the San Francisco Mint aggregated in value $24,190,496. Of this amount $20,878,500 was in 20's. During the forty years the Mint has been in operation the aggregate value of the coinage has been $1,000,066,389, of which $866,100,907 was in gold and $133,965,482 in silver.

PROSPECTORS here from Mariposa claim that the company owning the town site and land grant have not thrown it open. They say that the company will not allow wages to any one who finds paying claims, and that no placer mining is allowed within the limits of the grant. However, there is plenty of good mining ground in Mariposa outside of the grant, which bears about the same relation to Mariposa county that the whole county does to the mining area of the State.

ON the occasion of the recent great gale in north-eastern Washington a body of men engaged in placer mining were encamped in a dry gulch close to Five-mile creek in the Kootenai country. During the night the creek, swollen to enormous proportions, changed its course and swept through the gulch where the men were sleeping. Several of them reached dry land in safety, but three were not so fortunate and were carried away by the flood and drowned. The names of the victims were Raynor, Stewart and Metcalfe. The bodies were recovered and buried.

IN recent bromine tests at Denver upon thirty tons of iron sulphide concentrates from the Homestake mill in South Dakota, it is reported the extraction exceeded 97 per cent of the assay value. The company has decided to put up a bromine plant. The mills of the company turn out 60 to 75 tons of concentrates per day, which have hitherto been shipped to smelters. One or two tons of the concentrates were roasted with a Bruckner cylinder at the experimental plant; the remainder was roasted in the Pierce automatic furnace at the Argo works at a cost of 80 cents per ton. Under the old methods this roasting it is said would have cost $2 per ton.

AT a depth of 2000 feet the coal miners at Newcastle, Wash., recently came across some curious specimens. One was a piece of wood, petrified until it took on much the appearance of a piece of half-formed coal, but the annular layers are as well formed and as clearly defined as when they were growing. On either end of the piece of wood was an in rustation of a quartz-like character, beautifully white and sparkling, that looked like a coating of frost about an air hole. Near by were some pieces of coal formation, probably some pieces of wood further along in their transformation, and imbedded in them were several pieces of rosin as clear as amber and pretty as ambergris.

A TELEGRAM from Golden, New Mexico, says: It may sound like a fairy tale, but it is a fact nevertheless, that since the recent heavy rains in this section many nuggets and wires of gold have been uncovered and exposed to view, and numerous finds have been reported of pieces valued at from 25 cents to $1 on the hillsides in this little village. The volume of water rising through the arroyas has washed down the placer gold in such quantities that a sluice box placed in one of the small gulches in the very center of this town by Wm. White has become quite a curiosity as well as a paying investment. Mr. White cleaned up $4 of the "root of evil" after two hours' run of gravel through his box, showing an average of at least $2 per yard.

S. B. ROBBINS is down from the Alaska gold fields. "Last year was a very hard one," said Mr. Robbins, "particularly on those who went up there with barely enough to live on. Over 400 men crossed into the Yukon basin, some equipped with only a single blanket and enough food to last them a few days. The wages are a half ounce—about $8—a day, but there were two men for every job in sight. Every man who goes into the Yukon country should have at least $350 to $400. That is enough to carry him through for a year. He can then winter in the main basin and be at once prepared to commence work when the spring opens. Four of my friends during the past season cleaned up $90,000, but their luck was exceptional. There is room for 100,000 men in Alaska, but they must go there prepared to spend at least four months of the year in idleness. If they strike the country at the right time they can earn good wages at steady employment. I would caution all intending to go there to think well of what they may be called upon to encounter."

Personal.

PROF. R. A. F. PENROSE is inspecting the Cochiti district, N. M.

SUPT. WEYMOUTH of the Leonard mine has taken charge.

JAS. RULE has been at the Lone Star mine during the week.

WILLARD B. FARWELL, a well-known mining man, has applied to the Superior Court to be declared an insolvent debtor. His liabilities foot up $70,281.13. He has no assets beyond 14,990 shares of the stock of the Alvarado Artesian Water Company, inventoried as of no value.

Clipped and Condensed.

UNION PACIFIC stock is down to 13. Thirteen years ago it sold at 131.

PRENDERGAST, Carter Harrison's assassin, has been condemned to hang next Friday.

IT is estimated that the loss occasioned by the fifty days' strike of the coal miners will aggregate $20,000,000.

THE official existence of the San Francisco Midsummer fair terminated on the 4th. The total number of admissions was 2,219,236.

THE Denver *News* offers a reward of $1500, in sums of $250, for each arrest and conviction of the perpetrators of the assault upon General Tarsney.

THE Williams Palace Car Company, capitalized at $3,000,000, will begin the construction of cars at St. Joseph, Mo., to compete with the Pullman Company.

COMPARING prices to-day with those of a year ago, it is noted that they are less by 15 per cent for silver per fine ounce, 20 per cent for steel rails, 20 per cent for wheat, 31 per cent for mess pork and 20 per cent for wool in the American markets.

BY a majority of five the tariff bill passed the United States Senate last Tuesday. It now goes to the House, where it will not be concurred in. A conference committee will be appointed, and next month the bill still further modified may get through both houses.

LAST Sunday morning a stick of giant powder was placed on a stove in the Osboru Hill mines boarding house near Grass Valley. The top of the stove was blown off, the kitchen unroofed, crockery smashed, and the doors blown off the sleeping room in which Captain Gamble, steward of the boarding house, and three Chinamen were sleeping. The perpetrator had walked into the kitchen, and, after placing the giant powder on the stove, attached thirty feet of fuse and set a match to it. The mine will not be closed. President Grayson says it is the work of outsiders and the house will be rebuilt.

REGARDING the Pullman Company, which is one of the causes of the present trouble, the company's original capitalization was $1,000,000. In 1884 it had been increased to $16,000,000, and now it is $30,000,000. The miles of track covered by Pullman contract are 126,975. The income of the company in '93 was $13,414,708.92. The employes on the pay rolls at Pullman numbered 5565, their average yearly wages $613. Including the operating department, of which the employes are in a great measure paid by gratuities, the number of employes was swelled to 14,635 and the total of wages to $7,751,644.32. The town of Pullman has something over 12,000 people.

A RIOT is reported in the Cœur d'Alenes. A Boise dispatch says 100 men, masked and armed, have surrounded the Gem mine and mill, killed the blacksmith in the employ of the company there, captured Superintendent Neill, the foreman and others, and sent them across the divide into Montana. Troops have been called for, as a serious outbreak is feared. Superintendent Bradley of the Bunker Hill and Sullivan mines of Wardner has wired Governor McConnell that his men had been ordered to quit work, and unless they did he feared an attack would be made on that mine and mill. A. L. Gross of Spokane sent an appeal to Governor McConnell for troops to restore order. The Governor will go to the scene of action in person in case active hostilities are declared.

THE President's tariff bill has finally got out of the hands of the Senate. Of it Senator Perkins says: "While, of course, I do not approve the bill as a whole, I feel gratified that California has fared so well in it as it is passed by the Senate. Quicksilver, borax and currants are well protected. Lumber on the free list will hurt our lumber industries some; we have the bonded period extended on brandy, which will help us very much, and our fruit interests are well protected. There was another thing which I am more than pleased with. There was in the bill as it passed the House a provision for putting all machinery for vessels which ply in foreign trades, such as capstans, etc., on the free list. This would have been a great loss to our iron works, as last year we built 125 steam schooners. We quietly got the committee to restore the duty on these articles. In the exemption of savings banks from the income tax we also gained a victory. I think the House will concur in this bill and that it will become a law substantially as it now stands."

RECENTLY the Pullman Car Co. notified their employes at Pullman, Illinois, that there would be a reduction in their wages. Mr. Pullman gave $100,000 to his church and the company declared a quarterly two per cent dividend on $30,000,000 capital. The employes struck. The American Railway Union, a new labor organization, took up the labor trouble between the Pullman Company and its employes, and refused to handle any railway trains that contained Pullman cars. They did not decline to handle mail or passenger cars, but would not work in any way in handling or forwarding a train that contained a Pullman car. They "boycotted" those cars. The trouble began at Chicago. It was immediately transferred to this coast by the refusal of the Southern Pacific Railway Company to move any mail or passenger train that ordinarily would have a Pullman car attached to it unless that car was in the train. That occasioned an immediate deadlock and paralyzed all ordinary traffic. The trouble, which began June 26th, spread over every railway in this country west of Pittsburg, centralizing in this State at Sacramento and Los Angeles tying up the Southern Pacific and Santa Fe and culminating in calling out the U. S. troops last Monday. The State militia, several companies of which went to Sacramento, declined to take final measures in quelling the crowd in that city. The regular troops are in camp at the Los Angeles depot. All railroad points west of Pittsburg are in partial control of the A. R. U., and in this State the Southern Pacific is paralyzed. The conflict is now between the 250,000 who decline to work and the United States Gov't. Debs, the leader of the railway employes, an Alsatian, and a resident of Chicago, is in receipt of an injunction from Atty-Gen'l Olney, and of a citation from Federal Judge Ross to appear in Los Angeles. At this writing the situation is grave and bloodshed apparently impossible to prevent. The strike is the greatest of all the great railway strikes in the history of the country; it means more to the country than any former strike, and has already occasioned a loss of millions. It furnishes an unanswerable argument against the refunding of the Southern Pacific Railway debt and in favor of such governmental control as shall prevent a repetition of such costly folly.

California Borax Mines.

Thongh every now and then reports come from the desert of rich finds of gold and silver, yet the greatest indnstry of Death Valley and the desert is the mining and working of borax. Tweuty years ago borax was first discovered in California west of the Slate range, seventy-eight miles from Mojave, the discoverer, Jno. W. Searles, forming a company known as the San Bernardino Borax Mining Company, erected works which have been in constant operation ever since.

The borax iu the crude state forms in a crnst over the marsh. This crnst is removed, hanled to the works and placed in solution in immense tanks heated by steam. After allowing the solution to settle, it is drawn off iuto cement vats, where it is allowed to crystallize. This operation is again repeated, wheu the borax is ready to be sacked and shipped to market. After the removal of the borax from the marsh, erystals of tincal again begin to form, which are worked bnt once, when they are iu a salable couditiou. Iu order to facilitate this operation, water from the marsh is pnmped into large tauks, in which the tincal forms.

These works are models of mechanical construction, and are the best equipped on the desert. To the uninitiated borax working is bnt a repetition of boiling, settling and crystallizing. The fuel nsed is crnde petrolenm, which is hauled in huge tanks from Mojave.

The teams nsed in the transportation of the refined prodnct are cnriosities in their way—a wonder to the tenderfoot and a snrprise to the teamster. As these wagons are the greatest in existence, carry the heaviest loads and are seen no other place, a description is in order. The hind wheels are seven feet in diameter, front wheels five feet; hnbs, eighteen inches in diameter by twenty-two inches in length; tires, six inches wide and an inch thick; steel axles, three and one-half inches in diameter; bed, sixteen feet long, fonr feet wide and six feet deep. Each wagon weighs abont eight thonsand ponnds, and is capable of carrying 20,000 pounds at a load. Two wagons loaded with borax and an oil tank on a third wagon, completes the train hanled by the borax team. The team consists of eighteen mules and two horses—twenty animals in all, which are driven with a bell eord, used as a jerk line. A carload (40,000 ponnds) of borax is hauled each trip from the works to Mojave, and a tank of oil and two loads are hanled on the return trip.

It takes eight days to make the trip, and in nearly twenty years not a trip has been missed. Stations at which water can be had, and where feed is stored, have been erected for the borax teams to put np. The borax company has done mnch to assist in the development of the desert, as water is furnished free of charge at all their stations.

From the borax mine, twelve miles from Daggett, wagons of the same style and teams similar in make-up are used by the borax company.

Not all the borax of Death Valley and the desert is fonnd in marshes, and all the marshes, while having the same appearanee, do not contain borax.

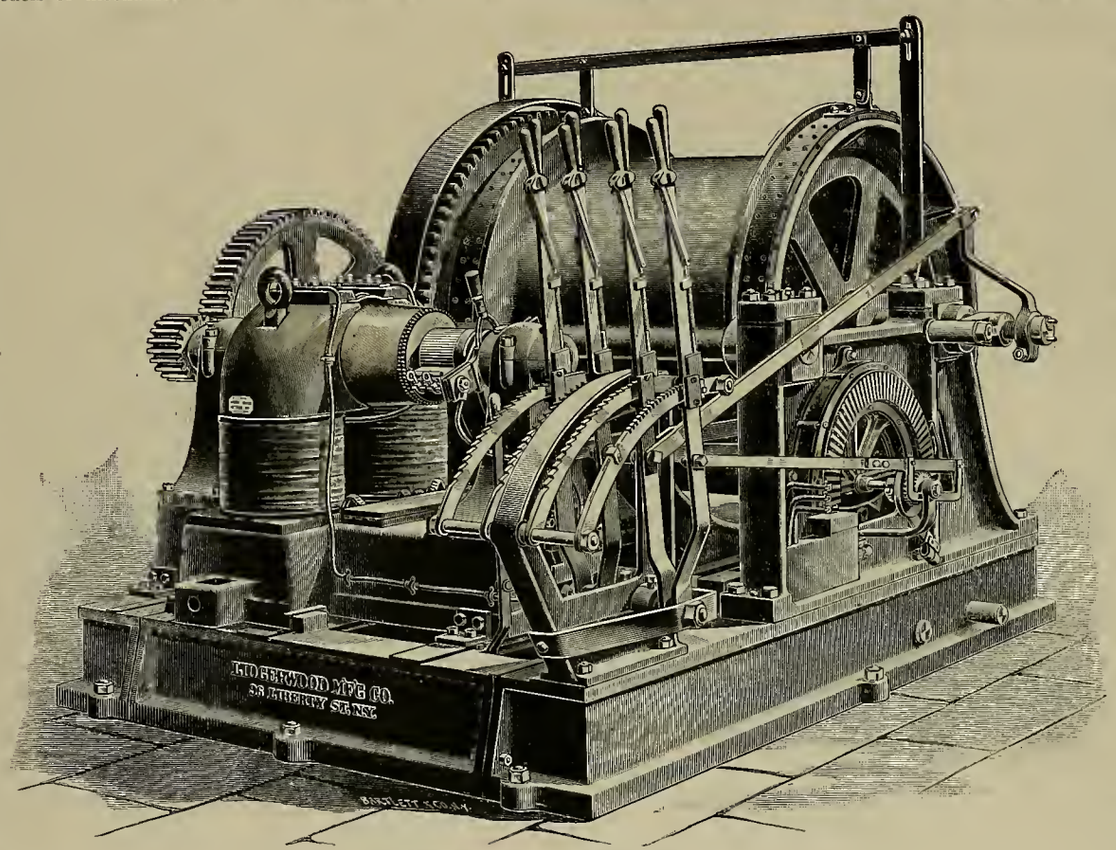
In Furnace Creek canyon of the Funeral mountains, and in the Death Valley marsh, borax is found in the shape of eotton balls, while in the San Bernardino Company's marsh none of these are found. The eotton balls are borate of lime and are scientifically known as nrexite. On taking them from the gronnd they can be pnlverized easily, bnt after exposure to the air they become very dry and hard. They become so hard that it is necessary to put them through a crnsher.

For months after the discovery of borax hundreds of prospectors braved the terrors of Death Valley, and many left their bones to bleach in that terrible sink-hole. Borax was searched for in nnheard-of localities, bnt it was only known to exist in marshes and beds of old lakes. It was not nntil the discovery of silver in the Calico monntains that borax was known to exist in deposits or veins. A miner, more cnrions than his fellows, had a piece of white-looking rock assayed, and made the wonderfnl discovery that hnndreds of prospectors had traveled over a vein of boracic acid more valuable than any marsh then knowu. This was a set-back to all preconceived notions of borax mining, and the snpposed-to-be valneless white rock of the Calico monntains became suddenly valuable. This is only another case of where the valnes at home were overlooked for the mnch-talked-of treasnres of a far-off land. The deposit at Calico is owned by the Pacific Coast Borax Company, and the prodnct is shipped to their works at Alameda for reduction.

Another and larger deposit of the same class was fouud at Monte Blanco, in a branch of Furnace Creek canyon, bnt its great distauce from a railroad made the working of it an impossibility.

In Death Valley are the rotting remuants of two borax works—institutions which promised, for a time, to make their owners rich. With a fall in the price of borax and the establishment of more accessible rivals, abandonment was forced npou the owners. The works north of Furnace Creek, which were erected to ntilize the product of Winter's discovery, elosed in 1888, after a rnn of five years. The Eagle works, erected at a marsh belonging to a Frenchman named Daunet, have also been closed down for several years.

Throughout all this couutry, with the exception of Death Valley, may be found the stakes of the railroad snrveyor, and several practical rontes for a railroad have been fonnd, though none have yet been decided upon. At the time of the discovery of borx in California, the wholesale price was 50 cents a pound. At present it is worth about 8 cents. Over 20,000 tons are nsed annnally, about one-third of which is produced in the United States.



FRICTION DRUM ELECTRIC HOIST.

Friction-Drum Electric Hoists.

On this page is shown a stationary hoist fitted with friction drnm, of a type which has been successful in mining operations. The bed-plate connections and controlling devices are of special design for electric power nse. The motive power is farnished by a standard Thomson-Houston motor. A speed reduction from the motor armature to the drum is accomplished by one intermediate shaft with proper gears and pinions. The drnm is mounted on a sleeve and is thrown into action with the large gear by a powerful friction elutch. Its speed, when running independently, is governed in this case by two hand brakes whieh exteud around nearly the entire circnmference of the drnm; nsnally only one is nsed. The hoist is equipped with five controlling levers, as shown in the illnstration. One operates the rheostat contact, one the drnm clutch, two are brake levers, which are entirely independent of each other, aud the last throws the reversing switch, giving the drnm, when thrown into action with the motor, positive motion in either direction.

One of the many advantages of the electric system for nnderground work is the ease with which the locomotive may be helped out where an incline occurs in the hanlage way. This is accomplished by means of stationary electric hoists operated on the same circnit as the locomotive. Their nse makes possible the employment of mnch smaller locomotives than would otherwise be necessary.

Fifty Millions in Silver.

The hnge vanlt at the mint, known as vanlt C, in which has been sealed np for nearly fonr years 50,000,000 of standard silver dollars, was opened a few days ago, and the long and laborious task of counting this big amount of mouey was beguu. As the occasion was deemed one of importance says the Philadelphia *Times*, there was observed some little formality. Dr. Caleb Whitehead had come on from Washington to represent the mint bnreau; Frank Sartori represented Superintendent Townsend, and W. L. Bosbyshell, Col. Bosbyshell's son, represeuted the former superintendent. William E. Morgan, United States Treasury examiner, was also present. United States Treasnrer Daniel N. Morgau, who, with his son, happened to be in this city, and accompanied by Major Worman, witnessed the breaking of the seal and afterward made a tour of inspection of the mint.

Maj. C. H. Townsend, cashier of the mint, having been given the combination of the vanlt, proceeded to open the door. This was easily accomplished, but when the inner door was reached some difficnlty was experienced, as even after the combination lock was manipulated the door refused to open, the bolts from long disnse sticking fast.

This was soou overcome, however, entrauce was finally effected and the assembled officials stepped within the inclosnre where lay piled up millions. On the inside door, fastened by sealing wax, was a sheet of foolscap paper containing the statement that $33,000,000 had been placed there on Febrnary 7, 1890, with Major Meline, of the treasnry; B. F. Butler, of the mint bnreau, and James C. Eyster, of the mint, present, and that further, $17,000,000 more had been sealed np on May 26, 1891.

The vault emitted a damp, musty odor when opened. Under the glare of the electric light the great wealth of stored silver was visible. There it lay in bags jnst as it had been placed. There were 50,000 bags, each coutaining $1,000 in shining eoiu. These bags were piled np one on top of the other, the topmost almost reaching the arched eeiling of the vault, nearly nine feet high. The whole mass had been arranged in different staeks. The first stack was thirteen bags high and eight across. Jnst in the rear of this was a second stack, while still fnrther back loomed np a third. This, thongh, represents only one section of the vault. Altogether there are nine. The weight of this great amonnt of silver is 2,850,000 ponnds avoirdnpois, and the tremendous pressure of the npper bags upon the lower had caused a nnmber of the latter to bnrst, causing their glistening contents to spread out npon the floor.

A Western Nevada Mining Camp.

Silver City is a little mining camp in Lyon county, says the Dayton *Times*, which is producing more gold thau all the other camps in the State combined, and yet it is a quiet little place, seldom heard of outside of the State. Prospectors, mine owners and

lessees are taking out ore all the time, and having monthly cleanups that range from $1000 to $15,000 for the work of two to four men. Last week the lessees of a certain mine cleaned up in the neighborhood of $20,000 from 35 tons of ore, taken out and sorted by three men in the space of five weeks. While this is an exceptionally good streak of luck, many others are making comfortable stakes of good wages out of their little mines. If the camp was a thousand miles from habitation—in Africa, Alaska, or some remote portion of the globe—men would flock to it by hundreds, and capitalists would lend aid in developing the mines, and such yields as were made last week would be heralded to the world by lengthy cablegrams, etc. But Silver City is in Nevada. It is a quiet little place; business men are doing well there, and some mine owners are getting rich, while all are making good wages, at least.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER VI.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

We are informed by historians that coal was burned as a fuel in the 9th century. Æneas Sylvius visited Britain about the 15th century, and in his writings may be found an account of poor people in Scotland "begging and receiving for their alms pieces of stone which they took with content. They burned these stones instead of wood, of which their country is destitute."

In the year 1232 Henry III granted license to dig coals for 100 pounds per annum.

Boetius, a Scot, in a history of his native land written in the beginning of the 16th century, says: "There are black stones digged out of the ground which are also very good for firing, and such is the intolerable heat, that they resolve and melt iron, and therefore are very profitable for smiths and such artificers as deal with other metals."

Dud Dudley (Dud Dudley's Metallum Martis, or Iron Made With Pit Coale, Sea Coale, &c., and With the Same Fuel to Melt and Fine Imperfect Mettals and Refine Perfect Mettals. London, 1665) shows that in his time the forests of England had been to a great extent destroyed in the manufacture of iron. The Parliament of Queen Elizabeth made stringent laws to protect the forests. Dudley invented a process for the smelting of iron with pit coal, and succeeded after others had failed. He refers to the destruction of of the forests as follows (Fol. 6):

"Now let me shew some Reasous that induced me to undertake these Inventions after many failings of others, well kuowiug that withiu Teu miles of Dudley Castle there be 20,000 Smiths of all sorts and many Irou works at that time within the Circle decayed for want of Wood—yet formerly a mighty Woodland Country."

In 1611 King James issued a patent to Simon Sturtevant to manufacture iron with "sea cole" or "pit eole" for 31 years. Sturtevant failing to accomplish what he had undertaken, the King cancelled the patent and issued a new one to John Roveuson, who also failed. A patent was then granted to Gumbleton, who erected extensive works at Lambeth and likewise failed. In 1619 Dudley was manager of his father's foundries in Worcestershire, but wood and charcoal being scarce and hard to be obtained, while coal was abundant, he made alterations in one of his furnaces, and with coal made good iron with success, but at first only in small quantity.

Sir John Pettus (Fleta Minor, the Laws of Art and Nature in Kuowing, Judging, Assaying, Fining, Refining and Enlarging the Bodies of Confined Metals. London, 1683) in his "words metallic," thus refers to coal: * * * "but these are not useful to metals. 'Tis true many have attempted to chark them and make cinders of them, to be used for metals when wood is scarce, but I have not yet heard of any certain success therein (though I wish it)."

William Pryce (Mineralogia Cornubiensis, 1778, Fol. 282) refers to the destruction of the forests of Cornwall to supply the metallurgical furnaces in tin smelting—leading to the introduction of coal. * * * "When we behold a wide and barren waste extending itself throughout the whole mining district of this county, without a tree to intercept the fury of the winds, we have no reason to commend the prudence of our aucestors in thus depriving their demesne of its necessary shelter. "The scarcity and increasiug cost of wood raised the price of tiu.

* * * "Necessity at last suggested the introduction of pit coal for the smelting of tin ore, and, among others, to Sir Bevil Granville of Stow, in this county, who made several experiments, though without success; neither did the effectual smelting of tin ore with pit coal take place till the second year of Queen Anue, when a Mr. Liddell, with whom a noted chemist, Mr. Moult, was concerned, obtained Her Majesty's patent for smelting black tin with fossil coal in iron furnaces. The invention of reverberatory furnaces built of brick, stone, sand, lime and clay soon followed this discovery, the form of which being simple has admitted little improvement to the present time."

In the chemical works of Casper Neuman, London, 1759), Fol. 246, may be found the following: "Pit coal, an excellent fuel for common uses, is for many purposes unfit. It cannot be employed for the running down of iron or other ores which are smelted in contact with the fuel; not, as some suppose, that the fossil coal does not give sufficient heat, but from its sulphurous substance corroding and scorifying the metal or rendering it brittle, when vegetable coals supply only the simple inflammable principle necessary for receiving the metal into its metallic form; * * * nor are fossil coals proper for fusion in crucibles, as they melt and cake about the vessel and endanger its cracking. The glass makers in England have been greatly depressed by this quality of pit coal and the scarcity of wood, insomuch as to proffer a reward of ten thousand pounds to those who discover a composition for pots that should best stand pit coal fires." This difficulty was removed when the art of making coke was invented and perfected.

Probably the first mention of coal in America may be found in an old book printed in London in 1729: (An Attempt Toward a Natural History of the Fossils of England, by Dr. J. Woodward; (Addition to the Catalogue of the Foreign Native Fossils. Bituminosa, folio 12). A specimen of coal in that remarkable collection is described as having been brought by an Indian out of the inner part of the country of New England.

Copper Mining.

The copper industry of the United States has for the past several years preseuted the anomaly of a steadily increasing production and falling prices, until at the present time copper is selling at a lower figure than ever before iu the history of the industry. The decline has been more precipitate during the past year, due to the general depression in business, which while it has greatly curtailed consumption has had no effect in lessening production, until at the present writing large stocks are held by producers and in the hands of warchousemen, exports have fallen off considerably, and manufacturers are fairly well supplied for the summer months by the receut sales of 15,000,000 pounds Lake at 9 cents. Since these sales were made private advices from New York record a still lower figure for Lake copper, viz: 8.80. Arizona copper is nominally 8 cents, but there is scarcely auy demand for this class of copper.

Up to the present time says the *Silver Belt*, producers have been enabled to meet the shrinkage of values by improved processes of smeltiug and refining and economies carried into almost every branch of the industry, but the limit in this directiou has about been reached, and there are now very few mines in the United States which can operate at a profit and some that are runuing at a loss. The present prices if contiuued for any length of time must result in the closing down of important mines and a consequent curtailing of production. Companies can not continue to run at a loss or exhaust their miues, for in time they will be worked out and costly plants will then become practically valueless. Some of the Michigan and Montana mines are best able to withstand the present depressiou. The Calumet & Hecla is still the most valuable copper mine iu the world, competent engineers estimating that the company can lay copper down in New York at 6 cents per pound, and that the vast ore bodies in the mine are sufficient to last for fifty years.

It is doubtful if any of the copper mines in Arizona can now be operated without loss, except the Copper Queen, and possibly the United Verde, and the small margin of profit remaining to them makes continued production a matter of questionable expediency. Of course no one expects the present low price of copper to prevail longer thau a few months, and should the business of the couutry revive perceptibly, the price of copper would respond to the quickened demand and consumption, and new life would be instilled iuto the industry.

It is not probable that the price of copper will ever again rule as high as in former years. As before suggested, the efforts of mine owners are concentrated iu the direction of more economical and larger production and while the prevailing depression may give a temporary check to expansion, yet copper will be amoug the first industries to feel the benefits of returniug prosperity. A moderately low price for copper (10 to 11 cents) has the advantage of stimulating cousumption, enlarging its field of usefulness, aud enabliug its substitution for less desirable metals in the mauufactures.

Globe, while temporarily haudicapped by the excessive cost of transportation, is one of the greatest copper districts in the Southwest. Her ore deposits are rich and extensive and as yet scarcely infringed upon. The process of smelting is the simplest and least expensive, and the copper when it comes from the furnace is so pure as to require no refining and goes into the market as a good merchantable copper. All that is required to give life to copper mining in Globe district is cheaper rates of freight on coke and copper which seem assured at no distant date by the completion of the Gila Valley, Globe and Northern railroad.

Mines on the Lower Colorado River.

Taylor D. Macleod in Yuma *Times*.

Picacho District.—One mile above the Azure King, on the California side of the Colorado, is the ten-stamp mill that pounded out much gold in early days. Three miles westerly over a good "wash" wagon road, clustered near the base of Chimney peak, or Picacho, are the mines. These mines produced good pay from several rich and extensive chambers, but are now holding a low grade ore, though specially free in gold. Doubtless systematic exploiting by a thoroughly competent superintendent, with "no strings on him," would result in the discovery of like extent and value. There's the rub! A self-respecting, competent mining man does not care to exploit "has been" mines through orders from parlor miners in New York, who don't know the strike of a ledge from a railroad strike. That there is a future for the quartz miues of Picacho district the writer has never doubted.

An English company, at great expense, has erected a pumping plant at the river to ground sluice for the gold that is certainly of good value in the gulches and impregnating the gravel mesas of this district. The success of the venture will hinge on the management of the enterprise in its inception. If they have not secured the services of some emiuently qualified practical hydraulic engineer, it may be written down as a failure. There is too much expense, too many leaks, in this method of lifting for miles the volume of water required in placer mining to "monkey" with any experimental measures. In all probability it will ultimately pay—provided our English cousins do not weary of assessments.

Silver District.—Three miles yet to the north, and 50 miles by river to Yuma, and 30 miles by trail ou the California side, we find the village of Norton's Landiug, maiutained solely and alone from the produce of the mines of Silver district.

Norton's Landiug has a postoffice and the general supply store of Levy & Caseres, a public school of 25 pupils and the largest settlement between Yuma and the Needles on the Colorado river. The mines are five miles westerly over good wagon roads. The veins of this district are remarkable for strength and coutiuuity. There is a system of four parallel ore channels, cropping boldly with an average width of 20 feet between walls, and a northwest and southeast trend, clearly defined, with uubroken croppings, three to five miles in length. In the southeastern part of the district the ledges are iu a contact of porphyry and granite, where the "soft" or smelting ores are had. The granite pinches out and the porphyry gives way to trachyte as the ledges reach north and the ore changes to a "dry," free milling silver chloride, with not two per cent of lead, as shown in the Clip, Rooster and New Deal claims—an excellent illustration of the influence the inclosiug walls have on the kind of ore deposited. The general country formation is porphyry.

New Laws For Mercur.

At a miners' meeting, held at Mercur, Utah, last week, the old by-laws of the district were repealed, and those drawn up by a committee appointed for that purpose adopted. Sections 9 and 10 were changed as follows:

"SECTION 9—Every locator of a mining claim in this district shall, within thirty days of the date of his location, move at least 200 cubic feet of earth or rock, if the same can be worked to good advantage by picking, and where the work must be doue by blasting at least 100 cubic feet must be moved within thirty days, and within thirty-five days from the date of discovery, he or they must file their location uotice with the District Recorder.

"SEC. 10—Every locator of a mining claim in this district must mark his claim at the point of discovery with a substantial monument or post, plainly marked with the name of the claim, the name or names of the locators, the direction and uumber of feet claimed each way, and also with a substantial and plainly marked stake or mouument at each eorner and at each certain end liue."

Senator Stewart's bill, which receutly passed the Senate, reducing the assessmeut work on mining claims to $50, was vigorously condemned in a resolution presented by Captain George Ryan, and it was unanimously adopted.

PLACER MINING IN ALASKA.

Continued from first page.

their veins. Those who have been there themselves generally have a larger story to tell.

Prospectors Going up the River.—Five men from Fresno went out in the Bertha last Sunday, intending to connect with the river steamer at St. Michaels and reach the mines some time in July. They carry a good outfit and intend to return in the fall of '97. This is much the easier way to reach the mines, but it is impossible to get there by next steamer earlier than August and the working season lasts from May until October. For this reason it is customary to go in over the pass and down the river and to go in March or April so as to cross the streams and canyons while the snow bridges are hard, and reach the diggings as soon as the frost begins to come out of the ground. All accounts agree that it does freeze there, sure enough, to the depth of about eight feet. In ground that is poorly drained and covered with moss only a little of the surface thaws out during the summer. There is a great extent of this level moss-covered country called "tundra." Fortunately moss is the favorite food of the moose and reindeer and either is a very serviceable animal when domesticated. They tell of reindeers hauling sledges one hundred miles in a day.

But not all the Yukon country is a tundra for there are rich pastures to be found, and on the third attempt Mr. McQuestin raised a very good crop of potatoes at Forty-mile Creek. It won't be long before somebody will find a way to supply the town with milk, if not from cattle then from domesticating some of the native animals.

A Strange Way to Kill Big Game.—Lieut. Schwatka publishes a thrilling illustration of Indians destroying a herd of moose while swimming the Yukon by jumping on their backs in the water and cutting their throats with butcher knives.

One man started from Juneau for the Yukon with a twenty-seven dollar outfit. It was impossible for him to patronize the Chilcat monopoly on that capital.

In such cases they have a way of organizing a sort of private Traffic Association by building a sled like one illustrated in the picture of the miner's tent below, and then packing the load a little at a time up the steepest places as we see in the picture at the right of the stove.

Mr. Peterson helped them haul their sleds up the hard places this year at 50 cents per cwt. by means of a pulley block and twelve hundred feet of rope. His scheme was to load a sled with snow and make that pull up a load of goods, but he could not load on enough snow to balance them entirely.

We see he has drawn a home-made map of the route on the side of his tent and given to the lakes and rivers nickuames of his own. Perhaps this averages quite as well as the "parlor geography" referred to by Schwatka when speaking of those who fix the maps with rivers and mountains where they think they ought to be. It seems that there is a great deal of that kind of Alaskan geography. Mr. N. L. Berdau, of 12 Montgomery street, says that when on the first excursion with "The Queen" under Capt. Carroll they steamed for three days through channels in Prince of Wales Island, where it was laid down on the map as solid land and they found an archipelago.

In the excursions they visit the Treadwell and Silver Bow mines, the glaciers and the beautiful timbered islands of south eastern Alaska, in a climate not much colder than that of Washington.

In the picture on the first page we have a view from the deck of the Queen. Juneau is on the right and Douglas Island, with the great Treadwell quartz mine, on the left.

The Silver Bow is a hydraulic mine, about four miles back from Juneau. The timber that we see and the principal tree of southeastern Alaska is yellow cedar —a fine-grained, fragrant and very enduring wood that is often used by Chinese for box lumber and makes excellent ship timber.

Cook's Inlet, the Alaskan Peninsula and the Aleutian Islands are all very different from the Yukon basin or the Sitkan country.

A Country of Varied Conditions.—When you hear that Alaska is so level that miners must use the rocker because there is no way to dispose of the tailings, and again read of grand canyons, cascades, rapids, etc., it is fair to presume that it has hills and valleys like other countries instead of drawing a mental picture of the whole country as like that part described by the writer.

In looking over the hundreds of pictures of glaciers and icebergs in Capt. Carroll's album we should infer that Alaska was one vast field of ice.

When Lieut. Gurnee tells of crossing the Alaskan Peninsula, where rich grasses grew breast high over vast prairies, and others tell of cattle in fine condition that never saw a barn, we reason that the Japan current prevents the thermometer from getting fifty or sixty degrees below zero, as they say it sometimes does on the east side of the mountain range where St. Elias sits in majesty.

We want to know whether it is worth while to go to to tell "All about Alaska" as Goodall, Perkins & Co. do in their pamphlet.

It is too late to get in by the Chilcat route, and if we wait for the next steamer of the Alaska Commercial Co., we cannot get there before August nor expect much more than a month's work before the season closes. To get that month's work one must plan to stay through the winter, and expect to be practically idle for seven months. This letter from Mr. McQuestin is regarded at the U. S. Mint as authority regarding the output of '93. Probably similar data will be available for '94:

FORTY-MILE, Aug. 15, '93.

Mr. W. H. Dimond.—Dear Sir: I have just returned from inspecting the mines in this district.

And in compliance with your request I am able to give you a "fare" statement of the output this season.

40 Mile Creek	35 miners	$25,000
Nugget Gulch	3 "	1,500
Franklin Gulch	40 "	35,000

MINERS' TENT AT YUKON GOLD FIELD.

Miller Creek	80 "	100,000
Davis Creek	35 "	30,000
Rilker Gulch	3 "	4,000

There are about 50 more miners in the country prospecting. Miller Creek was struck last spring, a year ago. There are 50 claims of 500 feet each. Nineteen claims are working this summer. They are making from $850 to $1000 to the hand.

Toward the mouth the ground is from 15 to 25 feet to pay dirt, and very flat and more difficult to open up.

Gold Hill mine at Sanana station was not worked last summer, on account of not having the material to work with.

Yours truly, L. N. MCQUESTIN.

In addition to this $195,500, the Mint has reports from other parts of Alaska as follows:

Treadwell Mine	$779,782
Juneau	4,400
Apollo	48,000
Betel Mines	2,500
Small Quartz Mines	5,641
Total	$840,323
From Yukon Mines	195,500
Total from Alaska	$1,035,823

Mosquitoes en Masse.—Next to the 240-stamp mill at the Treadwell, the biggest Alaskan stories are of the mosquitoes on the Yukon. They are said to come in clouds to present their bills, and to crawl over one another, so that a mosquito bar is little protection. Even the great brown bears, such as one may see at Liebes' fur store on Post street, are so annoyed by their attacks upon their eyes and ears that they sometimes exhaust themselves in fighting them until they sink down blinded and discouraged to die in some marsh.

Native Races.—All accounts agree in representing native Alaskans as very susceptible to the evil influences awakened by contact with the rough element among frontiersmen, and equally responsive to industrial training directed by enlightened Christian philanthropy.

Rev. Wm. Duncan began his work in '57 with those who were very superstitious and degraded even for savages. They now have a thriving community of 300 to 500 people living in neat houses of their own building, and claiming to have the largest church in the world that was out of debt when finished. They own stock in the large cannery and in the store. They have sawmill, blacksmith shop, carpenter shop and other accessories of a thriving frontier town. Mr. Duncan was too busy in raising his pupils to a higher standard of living and of duty to give so much attention to dogmas as the authorities of the mother church thought essential, and a bishop was sent to manage his people. Trouble arising from this and from the title of their old home being vested in the church resulted in their removal to American territory and a special act which gave them practical ownership of Annette Island, where their homes may never be molested.

The Rev. Sheldon Jackson, who has charge of Presbyterian missions in Alaska, is very highly spoken of as a practical man in elevating the race by industrial schools and churches. He very strongly recommends the establishment of Government culture stations to test the agricultural possibilities of Alaska. His view is endorsed by Gov. Knapp in his able report to the Secretary of the Interior.

As this city is the natural base of supplies and our capitalists are doing the principal business there, we are as much interested in his very sensible suggestions as though the territory was a part of California.

The childlike nature of the natives is shown by their way of taking medicine. If good, they divide fairly among sick and well and eat it up forthwith.

If bad, they hide it from the doctor's sight.

Since the white population is only one in eight and the others are so incapable of managing public business, it is desirable that offices should be largely filled by appointment from among permanent residents who are qualified. It should never be necessary to go hundreds of miles from any settlement to reach a constable or justice.

A grade over the Chilcat Pass and a postal service to the Yukon are very much needed.

There should be a more satisfactory plan devised for both whites and natives to secure titles to homes. An efficient militia and a Governor's cutter are needed to secure the execution of the few laws existing. There should be a responsible commission to recommend the necessary action to bring order out of the present chaos.

Until better representation is provided it might be the placer miners on the Yukon, and cannot attempt well for such commission to have a voice in Congress in behalf of the territory—possibly through one of their number as delegate. Senators and Representatives from the Pacific States should do what they can in Congress to promote settlement in Alaska and thereby advance important business interests of their principal cities.

So long as we can extend our interests in a country that produces four dollars where it consumes one, we shall gain rapidly by the venture.

Just now San Franciscans feel that they need a new Nevada.

The Official Awards.

On the 1st inst., Frank McCoppin, chairman of the Awards Committee at the Midwinter Fair, announced the awards in the Department of Mechanic Arts. They are mainly as follows, the words "first," "second," "third" and "special" indicating the class of the award, and preceding the name of the article exhibited on which the award was made:

Dow Pump Works, first, triplex-plunger, mining; special, compound duplex pumps; first, speed and pressure governors; first, boiler feed pumps; first, duplex waterwork pumping engine; special, fire pumps.

American Balance Slide Valve Company, first, balance for slide valves.

John E. Doak, Stockton, Cal.; first, gas engine.

Risdon Iron Works, first, ball engine; second, Bryan mill; first, Webster feed water-heater; first, Johnston concentrator.

A. L. Fish, first, Buckeye engine.

Best Manufacturing Company, San Leandro, first, gas engine.

W. H. Ohmen, first, compound engine.

Golden State and Miners' Iron Works, first, differential governor; first, compound slide-valve Corliss; second, Thompson high-speed engine.

Hendy Machine Works, special, quartz mill, complete; first, griffin wheels; first, horse whim, ore feeder, etc.; first, hydraulic giants; first, Russell engine; first hydraulic gravel elevator; third, iron valves; third, valves for hydraulic pipe; third, engine and boiler fittings.

W. T. Garratt & Co., first, ship's pumps; first, wine pumps; first, Hooker pumps; first, Hall pumps; first, Fisher pump governor; second, double-acting pump for hand or power; special, general exhibit; special, Elde engine, with centrifugal pumps; second, fire hydrants; first, brass work; second, logging jacks; special, bells; first, iron-bodied globe-valves; first, water gate.

Commercial Machine Works, San Francisco, first, tire upsetter and welding machine.

Whitman & Barnes Manufacturing Company, third, twist drills.

Roberts, Royle & Co., second, silk looms.

Dewey Engraving Company, first, half-tone engravings.

Goodyear Machine Company, special, shoemaking machinery.

Liddell & Williams, San Francisco, first, sandblast machine.

Mette & Jenkins, Santa Cruz, second, blacksmiths' swedges.

A. E. Johnson, Carson, Nev., first, hand drill.

Dunham-Carrigau-Hayden Company, first, Kearney & Foot Company's files; first, Tahor indicator; first, augur bits; second, drop forgings; second, Coffin's planimeter; first, Hayes tube expander; first, boiler tubes, etc.; first, Converse patent lock joint system; first, Eddy gate valves; first, brass goods; second, fire hydrants; first, water meters; second, air valves; first, pop safety valves.

Novelty Sewing Machine Company, first, perforating and embroidery machinery.

Richards Lock Nut Company, San Francisco, first, lock nut.

Zan Bros. & Co., San Francisco, first, broom-making machine.

Plumas county, second, minerals.

Stanley & Bartlett, Napa county, first, magnesite.

Bishop & Vaughn, San Benito county, first, minerals, etc.

A. Blanc, Oakland, third, native antimony.

Trinity county, second, minerals.

Santa Cruz county, third, minerals.

Placer county, special, gold and minerals.

Ballard, Martin & Neville, Tuolumne county, first, gold quartz.

Tuolumne county, special, minerals.

El Dorado county, first, minerals.

Butte county, first, minerals.

New Almaden Quicksilver Mining Company, first, cinnabar.

Mariposa county, third, minerals.

Siskiyou county, third, minerals.

S. S. Taylor, Plumas county, second, minerals.

Shasta county, second, minerals.

Plumas county, first, gold.

Merrill Miller Mining Company, Montana, second, silver and lead ores.

Beattie & Vaughn, Montana, second, silver ore.

Glengary Mining Company, Butte, Montana, third, silver and copper ore.

Anaconda Mining Company, Montana, special, copper.

Golden Sunlight mine, Jefferson county, Mont., second, gold and copper.

Mrs. M. A. Comfort, Deer Lodge, Mont., first, crystallized silver.

J. Chauvin, Butte, Mont., first, minerals.

F. A. Wey, Butte, Mont., second, minerals.

Dr. A. H. Mitchell, Deer Lodge, Mont., second, minerals.

Silver Bow Columbia Association, Butte, Mont., first, copper shield.

Butte and Boston mine, Butte, Mont., second, copper.

Boston and Montana mine, second, silver and copper.

J. C. Savery, Cable, Mont., first, gold ore.

High Ore mine, Mont., second, silver and copper.

Drum Lummon mine, Mont., second, gold and silver.

J. A. Leggat, Butte, Mont., second, silver and copper.

Toledo mine, Madison county, Mont., third, silver and lead.

R. Mackintosh, Salt Lake, first, minerals, etc.

Utah Commission, special, minerals, etc.

Goldsmith mine, Butte, Mont., second, gold and silver.

E. G. Morrison, Eureka, Nev., first, minerals, etc.

Occidental Alkali Company, Hawthorne county, Nev., second, soda.

Nevada Salt and Borax Company, Rhodes, Nev., second, borax.

D Bonelli, Rioville, Nev., third, mica.

Joseph Grandelmeyer, Hamilton, Nev., third, minerals.

State of Nevada, special, minerals.

Mono county, second, minerals.

Standard Asphalt Company, special, asphalt.

H. B. Stow, Forbestown, first, gold.

California State Miners' Association, special, State mineral exhibit.

Charles R. Allen, first, coals.

Union Oil Company, first, crude petroleum; first, mineral distillates.

Sierra county, second, minerals.

J. & F. Kesseler, special, onyx.

Millis & Wiug, Lehi, U. T., third, onyx.

Inyo Marble Company, San Francisco, special, marble.

J. E. Caldwell, Valley Springs, Cal., first, gray marble.

San Francisco Slate Company, first, slate.

Campo Seco Building Stone Company, second, tufa stone.

Amador Marble Company, second, marble.

Sites Sandstone Company, Colusa county, first, sandstones.

Chil Bar Slate Company, Placerville, second, slate.

J. Strahle Slate Company, first, slate.

W. E. Lindsey, Carson, Nev., first, travertine; second, marble and sandstone.

Dr. T. Boyesen, Palace, second, serpentine marble.

E. W. Bennett, thire, metal polish.

Del Mining Co., Virginia, Nev., third, silicon.

Silex Mining Co., Hawthorne, Nev., third, aluminum luster.

Union Pressed Brick Co., first, terra cotta and brick.

Natural Mineral Soap Co., Elko, Nev., third, mineral soap.

Gladding, McBean & Co., first, terra cotta and brick.

A. Steiger & Sons, San Jose, Cal., first, terra cotta, etc.

Gilsonite Asphaltum Co., St. Louis, first, gilsonite.

Nephi Plaster Co., Nephi, Utah, second, plaster of Paris.

Wasatch Asphalt Co., Salt Lake, first, asphalt.

Anderson Pressed Brick Co., Ogden, Utah, third, pressed brick.

Salt Lake Pressed Brick Co., Salt Lake, second, pressed brick.

James Burke, Steamboat Springs, Nev., third, limestone.

Penn Chemical Works, Calaveras county, second, copper cement.

Standard Asphalt Company, Kern county, special, asphalt paving cement or refined asphalt.

Natural Mineral Water Company, Ogden, Utah, third, mineral water.

California Petroleum and Asphalt Company, first, asphalt and lubricating oils and compounds.

J. W. Searls, first, borax in glass jars.

Union Oil Company, California, first, refined asphalt.

State of Nevada, first, salts.

Alexander Wise, Nevada, first, native sulphur.

R. H. Curry, first, Geyser table water.

Sonoma county, third, minerals.

Penn Chemical Works, Calaveras county, Cal., first, copper ingots.

Morgan Mill, Empire, Nev., third, sulphate of copper.

Selby Smelting and Lead Company, special, lead ore and products, solder, block tin, shot.

C. Bell, Lovelocks, Nev., second, nickel and cobalt ore.

Mathison Smelting Company, San Francisco, special, antimony.

Lander Company, State of Nevada, second, antimony, ore.

E. G. Denniston, Plating Works, first, silver-plated copper, amalgam plates.

George E. Woodbury, first, concentrator.

J. B. Freeman, Los Angeles, second, dry gold separator.

Gold and Silver Extraction Company, Denver, Col., special, extraction process for gold.

A. Smith, Bodie, Cal., first, mining cage model.

Union Iron Works, first, Union ore crusher; first, hoisting engine; special, vertical compound engine; first, iron frame battery; second, McCully crusher.

F. A. Huntington, second, roller mill, etc.

William Keast, special, model mine in operation.

L. S. Manning, Oakland, first, car coupler.

California Fruit Transportation Company, first, fruit car.

Brame Manufacturing Company, Reno, Nev., third, wagon wrench and jack.

Premier Cycle Company, third, cycles.

Pope Manufacturing Company, first, cycles.

Studebaker Brothers, San Francisco, special, general display; first, phaeton, brougham and physician's buggy; second, Victoria and passenger trap; first, harness; second, aluminum wagon.

Fix & Lundell, third, cabriolet.

H. A. Smith, first, Lovell cycles.

O'Brien & Sons, first, brougham and top buggy; second, landau, Victoria and phaeton; third, Columbia trap; third, vehicle spring.

Stoddard & See, second, cycles.

C. W. Stein, first, carriage and wagon trimmings.

Fort Wayne Electric Company, first, arc dynamo; special, wood alternator; first, regulator for arc machine; second, arc lamp.

A. E. Johnson, Carson, Nev., second, telegraph instrument.

Portland Electric Works, Portland, Or., first, fire alarm system.

Paraffine Paint Company, San Francisco, first, P. & B. electrical compound.

Western Electric Company, special, general display; special, single and double arc lamps; special, decorative work, with incandescent lamps, electric tower; first, electric scenic theater; first, station appliances; first, D. C. arc machines; first, D. C. incandescent machines; first, motors; first, automatic commutator switch; second, primary batteries; second, telegraph instruments.

General Electric Company, special, general display; first, incandescent lamps; second, T. H. arc lamps; first, sixty-inch searchlight; first, station instruments; special, regulator for arc machines; first, railway generator; first, T. H. alternator; second, T. H. arc machine; first, three-phase system; first, motors; first, application of electricity for mining.

Standard Electric Company, Chicago (Ill.), special, arc lamps; first, regulator for arc dynamos; special, arc dynamos.

Book Notice.

BROWN'S ASSAYING.—Fifth edition: E. H. Sargent & Co., Chicago.

This is an old friend in a new garb, being the fifth edition of a book which has received wide endorsement from practical men. It is just what it purports to be—a manual of assaying, written in clear style, accurate in statement and plainly worded. This volume is an enlargement and an improvement on former editions, and has 133 illustrations. The price of the book is $2.50, and will be sent post paid from this office.

Electrolysis Neutralized.

Regarding electrolysis, the leakage from electric car rails to adjacent water and gas pipes, whereby they are punctured by small holes and the metal eaten away so as to render the pipes unsafe, it has been said that the remedy for this danger to gas and water systems, involving great peril in case of a conflagration and heavy cost every few years to replace the pipes, is a perfect short conductor for the return circuit. This can be done by bonding the electric car rails by welding the ends together, or making the bond with heavy copper wire, and also by putting cross sections of wire from rail to rail every 100 feet. Where rails are bonded by wire that is simply wrapped or coarsely soldered, they are supposed to be fairly protected from leakage. But this is not true, for the reason that in a short time the wire corrodes, as does the rail, and even the solder gives way, and then dirt and dust of the street, entering between the bond wire and the rail, soon break the connection or in time render it feeble. The more recent investigations by scientists, says an exchange, result in the conclusion that the bonding should be done by welding the wires to the rail or the rails to each other. To do this latter, after the rails are down, is of course necessary. As nearly every great need develops a means of supplying it, so in this case an apparatus has been devised for making the bond perfect by welding the ends of the rails together after they are placed in the roadbed.

This is done by electricity. The machine hangs on a crane so as to be easily and swiftly transported. On a small car are carried two motors, which operate emery wheels and polish the ends of the rails to a mirror-like surface, that the electrical union may be perfect. Electrical machinery is then operated, which it is unnecessary to describe, by which side and bottom lugs are welded, and plastic steel also fills the joint; so what is known as a butt weld is made, besides the welding of the lugs to the web of the rail. It requires about two minutes to complete a welding, as the necessary heat is so quickly produced.

The result is a better roadway, because all the joints being closed there is no pounding or jolting, but smooth running, and unnecessarily a longer lease of life is given to the rails. The current leakage is then stopped and the gas and water pipes are protected from electrolysis.

This new process is now adopted in Brooklyn, and the rails of all the electric roads are being bonded by the new process, and thus the danger from electrolysis is removed. To make assurances perfect, tie rods are put in from rail to rail at certain distances, so that if a joint breaks there will still be a shorter distance for the return current to travel than by departure through the soil to water and gas pipes.

Australia's Gold Fields.

Some big stories are current of the richness of the Coolgardie gold fields in Western Australia, and particularly of one mine in the district discovered by two young adventurers named Bailey and Ford. The former, while prospecting, found a 45-ounce nugget sticking out from a reef in a big mountain of quartz. As quickly as possible a claim was staked out, but, in spite of all precautions, much valuable surface ore was stolen before a proper guard could be established.

The monthly output from the mine now amounts to 2000 ounces. From 30 tons of ore picked from a bulk of 1400 tons, 18,000 ounces of gold was obtained, and the remainder of the stone is expected to yield from five to six ounces to the ton. Out of 650 tons raised from a depth of 15 feet, 12 tons were picked, giving 8500 ounces of smelted gold. From another part of the mine four tons selected out of 100 tons of ore yielded 1600 ounces of gold. Some of the other returns of picked stone were: Five tons from 250 tons for 2000 ounces, two tons from 70 tons for 900 ounces, four tons for 1000 ounces, and 35 hundredweight for 800 ounces. Some of the surface "is so rich in gold that ounces can sometimes be picked out in a few minutes." Down to the 50-foot level only it is estimated that gold to the amount of 40,000 ounces is now in sight. It is as yet too soon to speak about the prospects of other claims which have been pegged out in and around Coolgardie. Very few of them have got beyond the rudimentary stage of prospecting claims, although reports have been received of some valuable finds, among which may be cited a reef carrying ten ounces to the ton, and the discovery of nuggets of fifty-two-ounce weight on a field forty-five miles distant. The population of the place amounted to about 1500 some weeks ago, but since then has diminished in consequence of the terrible hardships which must be encountered there owing to the climate.

A RAIN-MAKER IN INDIA has an apparatus, consisting of a rocket capable of rising to the height of a mile, containing a reservoir of ether. In its descent it opens a parachute, which causes it to come down slowly. The ether is thrown out in fine spray, and its absorption of heat is said to lower the temperature about it sufficiently to condense the vapor and produce a limited shower.—Atlanta Constitution.

Scientific Progress.

Tide Wells in the West.

Scientists favor the opinion that Nebraska, Kansas and parts of Indian Territory are situated over an immense underground lake or sea. It is a well-known fact that in several places in Kansas whole sections of land have suddenly disappeared, leaving only fathomless lakelets to mark the spot where they were once situated. Proof that there is something peculiar with the foundation of the section of country mentioned may be found in the celebrated "tide wells" of Polk, Butler and Colfax counties in Nebraska. Polk county is best provided with these curious wells, having between a dozen and twenty, which roar and ebb and flow with an unseen tide. The roaring of these remarkable curiosities (they cannot be called natural wonders, because they are the work of man, at least so far as excavation is concerned) is caused by the inhalation and exhalation of immense quantities of air. There are hours, regular and uniform, in which the air will rush out with a loud, hissing sound, and again an equal space of time in which it seems that all the air of the Platte valley will be sucked into the cavernous depths of these wonderful wells. The period of this ebb and flow does not seem to depend upon either the seasons or the state of the weather, but is thought to have some mysterious connection with the high and low tide periods of the Atlantic and Pacific oceans. A meteorologist of national reputation, who sought to fathom the mystery of the "Platte river tide wells," and who issued a little pamphlet with the title "Roaring Wells of Nebraska," gave it as his opinion that the roaring phenomenon was in some way connected with the prevailing direction of the wind, being strongest in time of west or southwest breezes. The farmers in the three counties mentioned as being best provided with these tide-regulating, air-expelling wells believe that the water supply is connected with a body large enough to have a regular ebb and flow of tide. All the wells in the counties of Polk and Butler which are tide regulated are of about the same depth, those of Colfax being deeper, but all extending to a porous stratum having the same general characteristics.

The Earth's Motion Made Visible.

Place on the floor of a room free from tremors and air currents a good sized bowl nearly filled with water, and sprinkle over the water an even coat of lycopodium powder, and across this make a narrow black line of pulverized charcoal. Place the bowl so that the black line shall coincide with a crack in the floor; or, if the room be carpeted, lay a stick upon the the floor exactly parallel with the mark. After a few hours it will be found that the line is no longer parallel with the stationary object, but has moved from east to west, proving that during this interval the earth has moved from west to cast. The reason appears to be that the solid floor has, with the earth and bowl, moved from west to east, and so has the water also, but at a slower rate, as there is a slight inertia, of which the yielding liquid does not instantly partake, to be overcome. It will be seen that the line or charcoal mark always moved from east to west.

Some Coming Electrical Wonders.

In the new foreground, foretells Professor E. J. Houston, one can see a practical method for the production of electricity direct from the burning of coal. Assuming the cause of chemical affinity to lie in the unlike electric charges of the combining atoms, "I see the practical realization of electric synthesis, whereby wholesome food products will be directly formed under the potency of electric affinities. I see, too, a marked advance in electro-therapeutics, whereby human life may be prolonged and its sufferings alleviated. Diagnosis and prognosis will be profoundly aided by exact electrical measurements of the various organs of human body as regards their electric-motive force and resistance. The electric-therapeutist of the future will employ electric charges and currents for restoring the normal charges and currents of the body, as well as for the stimulation of nervous or muscular tissues." "Back of these achievements," adds Mr. Houston," "I discern a practical apparatus for seeing through a wire—that is a device for looking into a receiver at one end of a metallic wire and seeing therein a faithful reproduction of whatever optical images are impressed on a transmitter at the other end, even though thousands of miles interveue. I see the possible use of the step-down transformer for the preparation of a road-bed or road surface by the vitrification of clay, or other suitable soil, by the intense heating power of enormous currents of electricity." He can see a good deal.

All Metals Have the Same Degree of Conductivity at Zero.

Prof. C. Dewar is makiug steady progress in his wonderful discoveries as to the effects of low temperature, says the New York *Sun's* Loudon correspoudent. He gave the results of his latest experiments in a lecture before the Royal Institution recently. The table was covered with many flagons of liquefied air enveloped in carbonic acid snow. He said he had proved that at absolute zero all metals have the same degree of conductivity to electricity, however much they may differ at higher temperatures. Prof. Gladstone's theory of refractive indices of gases had been perfectly confirmed. He fouud that a low temperature greatly increased the strength of metals. Iron at 180 deg. C. had twice the cohesive power it possesses at an ordinary temperature.

A fully saturated magnet was found to have its power greatly increased by a reduction to 180 deg. C. Intense cold has a strange effect on color. The professor sponged a scarlet card painted with iodine with liquefied air, and the brilliant scarlet changed to orange, but recovered its original hue immediately after it became warm again.

Many brilliant experiments were made by sending electric discharges through exhausted glass globes. All the well known phenomena of phosphorescence ceased as soon as intense cold was applied. The electricity tried to pass by any route rather than through the globe. What did this mean? asked the professor. Obviously that something was now frozen out which had before enabled electricity to pass across the vacuous space.

Gilbert Theory Concerning the Moon's Face.

The Gilbert theory, recently propounded by the well known scientist of that nome, concerning the moon's face, assumes that material constituting the moon once surrounded the earth in the form of a Saturnian ring; that the small bodies of this ring coalesced, first gathering around a large number of nuclei finally all uniting in a single sphere—the moon—the lunar craters being the scars resulting from the collision of the moonlets. It is argued that this hypothesis reconciles the impact theory with the circular outline of the lunar craters and explains the abundance of colliding bodies of large magnitude, such a system also accounting for the formation of lunar wreaths, central hills, arched inner plains, level inner plains, and the association of inner plains with central hills, explaining, too, the peculiarities known as furrows, sculpture, rills, and rill pits. Further, during the growth of the moon, it is assumed that many of the mooulets must have collided with the earth and formed impact craters, which have been obliterated by erosion and sedimentation; and it is suggested as possible that these collisions imitated not only the differentiation of continental and oceanic plateaus, but the series of geographic transformations of which geologic structure is the record.

Recalling a Mailed Letter.

To recall a letter once mailed is almost as difficult a task as to take back an assertion once uttered. The sender must appear at the postoffice aud is handed a blank to fill out. In this he must state when and where he mailed the letter, how it was addressed, must describe the envelope, state the amount of postage prepaid, and testify "that the above-mentioned letter was written by me or by my authority and I desire to recall it for the following reason"—and then state the reason, which is usually "mailed by mistake."

He must then sign his name, so that the handwriting may be compared with that on the letter, and sign a receipt. If the address cannot be shown to be in his haudwriting, or is printed or type-written, he must describe some peculiarities of the envelope sufficient to identify it. If he is unable to do this the letter is refused, unless the postmaster kuows the applicant and is satisfied coucerning his good intentions. If he is satisfied he asks for a statement concerning the conteuts, and the applicant is then obliged to open the letter and read portions of it in the postmaster's presence, to prove that it is the one he described.

But if the letter has been sent away the process of recalling is still more difficult. A similar blank has to be filled out, a minute descriptiou telegraphed at the sender's expense to the postmaster at the office of its destination. If discovered in time the letter is then intercepted and sent to the department at Washington with a statement of the case. Why should anyone want to recall a letter so much as to take this trouble? Well, there was one case at the local office recently where a valuable deed was mailed and the sender received information that satisfied him that the sale should not be made. In another case an important contract was sent, and information received immediately after made it imperative that it should be revoked.

THERE is talk of lighting with electricity about twenty-five miles of the dredged channel of Mobile bay. At present the path is too dark and tortuous for night navigation. It has been proposed to use copper for the armor as well as the core of the cable supplying the current, as induction is so great with steel sheathing as to interfere with the transmission of an alternating current.

AN ELECTRIC RAILWAY 300 miles long, to cost $2,000,000, and connecting Boise City and Lewiston, Idaho, *via* White Bird, Little Salmon and the Weiser valley, is in contemplation.

INVENTOR WISHES TO MAKE THE ACquaintance of a Practical Miner, one who has had experience on the upper Fraser, British Columbia.

Address, **J. M. THORP,**

COLLEGE PARK, - - CALIFORNIA.

Professional Cards.

WM. GILBERT, B. S., Manager.
PRACTICAL ENGINEERING SCHOOL,
205 Goodenough Building, Portland, Or.
Civil, Electrical, Steam, Mining, Assaying.
Full charge of plant taught. Circular.

Electrical Engineer.
C. PER LEE NOXON, 628 MISSION ST., SAN FRANCISCO, Consulting Electrician. Dynamo and Instrument Repairing a Specialty. Correspondence Solicited.

F. ORTON, Mechanical Engineer.
EXPERT DESIGNER of Special and General Machinery.
PREPARING PLANS of Steam, Air and Hydraulic Apparatus; Iron and Wood-Cutting Machines; Transmission of Power, Etc.
218 Mission St., San Francisco.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
728 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

Nevada Metallurgical Works,
No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.
C. A. LUCKHARDT, Manager.
Established 1869.
ORES WORKED BY ANY PROCESS.
Ores Sampled.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.

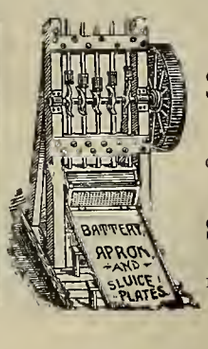
Agency for the CYANIDE PROCESS
For the Counties of Shasta, Trinity, Siskiyou, Inyo and Mono, California; Esmeralda, Storey, Lyon and Douglass, Nevada.
Plans and Estimates made for IMPROVED CYANIDE PROCESS PLANTS for Gold and Silver Extraction, and competent instruction for successfully working the same on a large, practical scale.



To Gold Miners!

Silver Plated Copper Amalgam Plates

For Saving Gold.

GOLD REMOVED FROM OLD PLATES AND REPLATED. Old Plates bought. Get our Reduced Rates. Five thousand orders filled. Twenty-five Medals Awarded.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,
653 and 655 Mission Street, San Francisco, Cal.
E. G. DENNISTON, - - - - - - - - - - Proprietor.
Every description of work plated. Send for Circular.

Mechanical Progress.

Boiler Testing.

"How do you know when a plate is crystallized in a boiler?" is a question frequently asked engineers. A plate that is crystallized has a bell-like ring, while a good plate has a deader sound. An old engineer used to say that when the plate sounded as though it was good he knew it was bad, and when it sounded dull, as though something was the matter, he knew it was all right. That is one way of putting it. The inexperienced engineer would say the crystallized plate was the good plate every time, if he judged by the sound alone.

"Every boiler-maker isn't an expert at finding cracks in a boiler shell," said an inspector the other day. "I found a crack in a boiler a little while ago directly over the fire about half way up to the brickwork. We ordered a patch put on, but word came back that there could be no crack in the boiler, as the boiler-maker had hunted over every inch and could not find it. I wrote them where the crack was, but still the boiler-maker could not find it, and I had to go out and draw a chalk mark around the crack before the boiler-maker discovered it."

Small cracks in a boiler are not always easy to find; they cannot always be seen and must be detected by the sound or feeling. The latter method is the surer. The inspector taps with his hammer along the boiler shell, with his finger on the plate a few inches in advance of the hammer, and his sensitive finger will feel the vibration of the plate if it is injured. But if there is a crack in the plate between his finger and the hammer, no vibration can be felt, the crack preventing it. In this manner the crack can be readily located.

The Great Cost of Cable-Laying In New York Streets.

The chief reason why New York, aside from the difficulties of obtaining the necessary permits from the city authorities, was so far behind other cities in replacing horse-car lines by cable roads was that here the cost of laying the cable was much more than in smaller cities. The expense of cutting a path through the network of pipes of every description in the New York streets frightened capital away. At Broadway and Fourteenth street there were no less than 32 different pipes, belonging to more than a dozen different companies — gas, water, sewer, steam, pneumatic, electric, etc. All these companies had rights which the cable company was under bonds to respect. The work of getting the pipes out of the way had to be done without interfering with the service of each of these corporations. Sometimes days were wasted in trying to find the owners of pipes that had been abandoned, perhaps, for years. Gas companies and steam companies had gone out of business, but had left their pipes to make the confusion under the pavements worse confounded. The enormous cost of this work explains the high price asked by some of the contractors for certain parts of the lines in New York City. Some blocks along the lower part of the Bowery are said to have cost the contractors at the rate of $300,000 a mile.

Heating Iron in Cold Water.

It would now seem as though the common but time-honored blacksmith's forge and all other kinds of fiery furnaces will become extinct and live only in the memory of a rapidly-receding past. The forge and furnace of the future will consist of a lead-lined glass or porcelain vase or cupola filled with cold acidified water, to which is connected a strong positive conductor. A pair of tongs with insulated handles, attached to a flexible negative conductor, are also provided, making this new forge and outfit complete. The smith seizes the piece of iron he wishes to manipulate with the insulated tongs, and plunges it into the sour water, which begins to boil and bubble the instant it comes in contact with the iron which, in a remarkably short space of time, turns to a red and then to a white heat, ready for the work of the smith. So rapidly is the heating done that the water and the portion of the iron not immersed are but slightly warmed. The principle involved in this process is the same as in incandescent electric light. Resistance produces the light and heat. It is said that enormous heat can be produced by this method, much greater than is necessary to extract the iron from the most refractory ores. Like all, or nearly all, of the late practical applications of electricity, says *Machinery*, this discovery will no doubt lead to marvelous results in the perfect and rapid handling of heavy iron and steel plates and bars that have to be hammered and welded; and more valuable still for tempering purposes, as the required heat for the immersed portion can be quickly obtained while the remaining portion is kept comparatively cool, which cannot be done by present methods. By electricity we live and move, and by electricity some of us die.

A SPANISH INVENTOR claims to have produced an iron automaton whose inner organs are machinery and whose diet is cartridges. The rifle which the monster carries can be turned in any direction, and delivers 50,000 shots in 15 minutes. Electricity provides the motive power by which the machinery is set in motion.

A FRENCH PHYSICIAN has devised a vibrating helmet for the cure of nervous headache. It is constructed of strips of steel, put in vibration by a small electro-motor which makes 600 turns a minute. The sensation, which is not unpleasant, produces drowsiness; the patient falls asleep under its influence, and awakes free from pain.

THREE THOUSAND THREE HUNDRED AND FORTY-ONE SHIPS, of 7,659,000 tons, passed through the Suez Canal in 1893, yielding sixty-eight millions in dues. According to the report of the company, about to be issued, passengers numbered 186,495, and yielded 1,864,000f., while sundry accessories yielded 384,000f., making a total of seventy-one millions. Three thousand and eighty-two of the ships, 92½ per cent, passed through by night. The average duration of transit was 20 hours 44 minutes, of actual motion 16 hours 53 minutes. There were nine petroleum vessels. As to the nationality of the vessels, the English were 2405, German 272, French 190, Dutch 178, Austro-Hungarian 71, Italian 67, Norwegian 50, Ottoman 34, Spanish 29, Russian 24, Portuguese 10, Egyptian 5, American 3, Belgian 1, Brazilian 1, Japanese 1.

WYOMING has 30,000 square miles of coal deposits. There are 5000 miles of irrigating canals, watering 2,000,000 acres. The canals cost over $10,000,000. The live stock interests exceed $100,000,000 in value. Over $5,000,000 in bullion has been taken from the mines in one county.

GREENLAND'S interior is estimated to be covered by a shield-shaped cap of snow and ice not less than 5000 feet, or one mile, in thickness.

THE Congo has twice the extent of the navigable waters of the Mississippi and its tributaries, and three times its population.

THE sound of a bell which can be heard 45,000 feet through the water can be heard through the air only 456 feet.

THE deepest boring is that of Schadebach, in Prussia, 5736 feet deep—a little over one mile.

THE opportunity of a lifetime may not last five seconds.

Balking the Umbrella Thief.

Another long-felt want is about to be filled. Drawings for the invention were received at the Patent Office only a few days ago, and the man is preparing to build him a new house in the most fashionable part of the city with the prospective funds from his invention. It is nothing less than an automatically returnable umbrella. That is, one that will make its own arrangements for its return to its owner when lost. The nomadic habit of umbrellas, especially when left unchained in the neighborhood of a crowd, has long been a subject of comment, and it has been a serious question whether the trouble was altogether with the morals of the umbrella that would go off and lose itself, or an innate depravity of the umbrella-using public that made findings keepings without much inquiry as to the identity of the loser. The new non-losable umbrella does not differ essentially from the ordinary article, except that it has a little stouter handle. Herein is concealed the working part of the device. It is a compactly arranged phonograph, with a multiplying reverberator, enabling it to be heard for say the length of a street car or a good-sized hallway. In connection with the phonograph is a combination lock which sets the machine in action. The owner of the umbrella on setting it down simply switches the combination, and as soon as it is picked up the phonograph gets in its work. The remarks can be arranged according to the taste in oratory of the man who owns the umbrella, and can range from a politely couched request not to disturb the rain protector to a stentorian cry of "Stop Thief," or "This fellow is stealing another man's umbrella," or any other exclamation of a more forcible nature, the strength of the language being only limited by the local municipal ordinances regarding profanity.

THE SCARCITY OF COAL caused by the general strike of the miners has seriously affected many central electric stations in Illinois, says the *Western Electrician*. Several have been compelled to resort to wood as fuel, while some have been obliged to shut down altogether.

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.

FOR BOILERS, DREDGING BUCKETS AND SHEET IRON WORK, CORRESPOND.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

Ledger: Work at the Gwin is progressing as rapidly as possible. Lumber is arriving daily, and some of the castings for the hoisting plant are already on the ground. The shaft is down about 50 feet.

The Mayflower gold mine has appealed the cases in which it was defendant and Blamey, Pratt and Evans plaintiffs, respectively, from the Justice's Court of Amador to the Superior Court. The grounds of the appeal are that the defendants' representative, Stephen H. Emmons, was not served by the constable, and that the company is sued under the name of the Mayflower Gold Mining Company when its name is the Mayflower Gold Mine.

The Mason Mining and Milling Company near Clinton has made a successful strike which they claim means a great deal for the interested parties. Their tunnel is in 400 feet and taps the ledge, which shows free gold, and will assay in the neighborhood of $30 a ton. Prof. Newton of the company, the most of whom are residents of Woodbridge, was on the grounds a few days ago and gave orders to put the ore on the dump until a quantity is on hand sufficient to make a milling test. J. L. Cox and E. G. Rutledge have been in charge of the work.

Butte.

THE BULLION MILL.—*New Era:* The Bullion mill has been running now about ten days upon ore from the Keystone ledge with good results. The Bullion Company owns the Keystone as well as the Bullion ledge, and will work Keystone ore, at least for the present. Development work will be continued on the Bullion.

The company has an engine now on the Keystone and is hoisting ore. This ledge is quite wide and the company will find no difficulty in getting ore enough mined to keep the mill in constant operation.

Although the Keystone has to be worked from a shaft, no special pumping arrangements will have to be made, as the mine is so nearly dry that water can be easily handled by the hoisting works.

Calaveras.

THE THORPE MINE.—*Chronicle:* When Capt. Thorpe worked this property, there was a ten-stamp mill on the mine, and the property at that time paid more than expenses, as the records of an old hook still in the possession of Capt. Thorpe shows at various times where dividends were paid to the owners from workings of the mill. However, like the majority of the early worked mines along the mother lode, the time came, about 14 years ago, when the mill wore out and an increase of water resulted in the closing down of operations. The mine soon filled with water, in which condition it remained until some two years ago, when Hayward and Lane took the water out under a bond from the owners, but did not buy it. Again the shaft filled with water. Within the last week the property has been bonded by L. Allgewhr, a successful mining man from Montana, who, with his two sons, have placed a force and lift pump on the shaft, propelled by a donkey engine, and have in five days lowered the water in the shaft 38 feet. It is thought that inside of a month the mine will be cleared of water and ready for the resumption of underground operations. Mr. Allgewhr will leave his sons in charge to clear the mine of water and he will start East in a few days to organize a strong company with capital sufficient to place this old landmark of hullion producers on its feet and make its mark as a second Utica. It is certainly on the same vein.

Modoc.

AT HAYDEN HILL.—*Argus:* Will Dillon was down from the Golden Eagle arrastra last Saturday and told us the quartz mills would start up immediately after the 4th of July. The Golden Eagle Co. is building a new mill on Willow creek, which is now nearly ready to operate.

Owen and White, the principal owners in the Hayseed mine, have reached an extra good prospect.

The Frank Vanderelst mine, which is honded to E. S. Shanklin, is said to be prospecting better than any of the other undeveloped claims.

The Golden Eagle is, and always has been, the most regular mine on the Hill in its gold output. They are now working at a depth of about 300 feet, which is over 100 feet deeper than the shaft of the old Juniper mine, which in its day was the wealthiest mine of the district.

All the mining at Hayden Hill, in years past, was near the surface, and it is only lately that the miners are going deeper into the mountain. Capital has been required to make the proper developments; and since persons of means have become interested, Hayden Hill has taken on an air of activity and prosperity.

Siskiyou.

FROM SAWYER'S BAR.—Gravel mining is a secondary consideration yet; still it adds many thousands of dollars to the annual output of Salmon River, and as the claims are of unknown area, years yet to come will see gravel mining in full operation in our midst.

On the North fork of Salmon, Manuel Joseph & Co. are sluicing at White's Bar.

Louis Moore, at Trook's Flat, is washing rich gravel, and the Gold Nugget with its giant is moving rich soil, as the washups prove.

The Gold Hill is adding its usual quota to the output, and the Paradise Flat is waiting patiently for the dry season in order to begin drifting. The Whistle Bear is sinking, and before many days will be on bedrock, where the precious metal lies. Hickey Brothers are cleaning up after a very successful run and the Buckhorn boys are cutting a race to turn the river so as to be able to commence operations at an early date in the ancient river bed. The Red Hill has turned their mammoth water supply through their pipes and are doing well.

Olsen is smiling and happy at his good luck, and who would not he if he was making a thousand clear every week.

The Gold Ball Mining Company are extracting some remarkably rich ore the last few weeks. A shipment of 500 pounds of the ore to Selby's works realized the sum of $5,000.

Tuolumne.

THE MAMMOTH *Independent:*—On the Mammoth mine, near Jacksonville, work was resumed early in February. They have run on the vein 200 feet, the average value of the ore is $12 all through. In one place the vein was 30 feet wide, the shoot extends 300 feet further, as the clippings show free gold in the rock. Bowlders rolled down the hill from above show gold sticking out of them. Geo C. Webster the owner, has bonded the property to Messrs. McDonald, Whitney & Co.

The old Gashwiler is owned by Alvinza Hayward and the Hobart estate. The owners are sinking a new shaft, which is now down over 50 feet, and on the vein.

The Rawhide mine continues in the same rich ore. The last clean-up produced a very fine bar of gold, but the richest ore is not being stoped, as the owners are getting their mine in good working and systematic condition by putting up raises, etc. It is safe to state the last crushing yielded over $100 per ton. A new shaft is being sunk south of No. 3, or north shaft. Exceedingly rich ore was taken therefrom the past week. The water is being successfully controlled. The only need of this wonderfully rich mine is adequate power. When the new steel pipes are laid to take the water from the top of Table Mountain, all machinery, mill, even to 100 stamps, could all be successfully run by this power. The output then would be something enormous monthly, eclipsing the record of any gold mine in the world.

To the north of the Rawhide, is the Rappahannock, which is being prospected under the management of Richard Chute, one of the owners. The new shaft, almost in the center of the location, is sunk over 60 feet, which at present shows a large body of ore, heavily impregnated with steel gray arsenical pyrites. This lode is undoubtedly the east vein. Gold is seen in pan prospects; also some fine colors are already visible in the rock. The formation is a rich black metallic slate. The management is at present cross-cutting the ore body to determine size and value. Machinery will soon be placed on the mine, which will consist of a 75-horse power engine and boiler, with hoist, etc., just as soon as the necessary buildings are ready to receive the same. This property will be thoroughly equipped for permanent work. Besides, Mr. Chute will also place on the ground a 50-horse power engine and boiler, and a 12-horse power engine and boiler, combined; the latter, will he used for light work, if needed. Three Cornish lifts are also to arrive for pumping. The old shaft, at the south end of the mine, is known to contain rich shoots. It will be unwatered, enlarged and re-timbered, and placed in thorough working order to work that portion of the mine.

NEVADA.

Washoe District.

IN THE CON. CAL. & VA.—Superintendent Lyman's official report says the average assays of car samples of the ore extracted from all parts of the Consolidated California & Virginia mine where new developments are being made was $66.78 per ton. In the mine during the week have been stoping out on the west side of the upraise between south drifts 2 and 3 in the ore body recently found, the ore in this direction looking well. The upraise from the sill floor of south drift 4, on the 1700 level, has been continued upward 10 feet with the size of two sets of timbers, and connected at the south end with south drift 3. In the upper part of this upraise, near the point of connection, the ore is somewhat better than below, assaying about $40 per ton. Have shipped during the week to the Morgan mill 548 tons 910 pounds of ore, the average assay value of which per railroad car samples was $10.77. The average assay value, per battery samples, of all the ore worked at the mill during the week (470 tons) was $53.38 per ton. Bullion now on hand in our assay office—assay value about $37,000. From the upraise of the 1000 level, 585 feet south from the shaft station, at a point 37 feet above the sill floor, an east crosscut has been advanced 38 feet in porphyry and clay formathon of low assay value.

The west crosscut started 119 feet in from the mouth of the drift running south from the crosscut run west from the main north drift on 1465 level of Ophir has been extended 18 feet; total length 45 feet; face in harder porphyry, carrying clay separations. Have continued jointly with the Mexican Company the work of making repairs in the main shaft at the 1100 level. Central tunnel—The west crosscut started from the drift run north from the old Mexican shaft on the tunnel level at a point 26 feet north from the shaft has been extended 61 feet; total length 203 feet; face in a porphyry formation, with some quartz of low assay value. The north drift from the end of the west crosscut 56 feet above the tunnel level has been extended 51 feet; total length 90 feet, continuing along in quartz and old fillings assaying from $5 to $10 per ton.

The Union Con. and Sierra Nevada joint north drift on 900 level, which was run from the joint west drift at a point 1520 feet west of shaft, has been extended during the week 22 feet; total length 475 feet; face in hard porphyry. The joint south of lateral drift from the joint west drift, at a point 1520 feet west of the shaft, has been extended 10 feet; total length 162 feet; face in clay and porphyry.

The west crosscut started from the top of the upraise of Mexican, which was carried up 45 feet above the sill floor of 1465 level, at a point 40 feet west from the main north drift and 100 feet north from the south line of the mine, has been extended during the week 24 feet; total length 154 feet; face in porphyry, clay and quartz.

The north drift started from the north boundary on the 200 level of Best & Belcher, 1115 feet from northwest drift, has advanced 30 feet through soft porphyry; total length 86 feet. Northwest drift started in west crosscut 2, 414 feet from main north drift, on 800 level, has been advanced 23 feet; total length 108 feet; face in quartz and porphyry. The south drift started in west crosscut 5, 1115 feet from the northwest drift, on the 200 level of Gould & Curry, has been extended 14 feet; total length 100 feet; face in quartz giving low assays. From the end of this drift we ran an east crosscut, No. 2, and advanced it 23 feet, passing through quartz giving low assays. Work was discontinued in this crosscut, with its face in porphyry.

A west crosscut from the end of southwest drift, 100 level of Hale & Norcross, has been advanced 11 feet; total length 41 feet; face in clay and porphyry. We continue easing timbers in the main southwest drift on this level. East crosscut from the south drift, 1100 level, was advanced 9 feet; total length 30 feet; face in hard porphyry.

IDAHO.

THINLY SCATTERED. — Pocatello *Tribune:* Frank Gibbons is back from a two months' prospecting trip. He was all along the Snake and its tributaries clear into Owyhee county. The bars along the Snake river, he says, are staked out from below the mouth of the Bruneau clear up to the foothills. There is gold everywhere, he says, but not enough to pay with a rocker. Mr. Gibbons was over into the opal fields in Owyhee and took up an opal claim, bringing back one small opal as a trophy. Everything is dead there—not a single claim being worked.

NORTH CAROLINA.

COLUMBIA MINING COMPANY. — This company, which has its offices in Washington, and of which Dr. A. C. Patterson is secretary and treasurer, during the past four months has been operating two improved Crawford mills at their gold mine near Carthage. An immense ore body has been developed and while the ore is low grade, yet this mine promises to become one of the largest in the South. The cost of mining is said to be little more than that of quarrying. Over 1000 tons have already been treated by the two mills in question, and the average amount cleaned up has been about 84 per cent of the assay, exclusive of a quantity of rich concentrates. The ore is comparatively free milling, though, owing to the presence of sulphurets, not more than 50 per cent of the value has been saved by stamps. The capacity of the Crawford mill on this ore is over 10 tons per 24 hours, and so gratifying have been the results obtained that three more Crawford mills have been ordered by the company, and before the end of April a complete plant of five mills, with a capacity of about 52 tons daily, will be in operation at this mine. Mr. Alfred A. Watson of Carter's Mills, Moore county, is manager of the mine. While miners have admitted, as a rule, that the principle of the Crawford mill is correct, yet some have contended that the cost of the wear and tear must always be excessive. It is claimed that proof to the contrary is afforded at this mine, where the cost of wear and tear on the treatment of 1000 tons is shown to be only 20 cents per ton. Several other mines in the neighborhood, at present at a standstill, are considering the advisability of adopting the Crawford mill in consequence of the results at the Columbia.

OREGON.

Tidings: Mr. Rader, who has taken $8,000 out of pockets in a rich vein on the stage road between Hornbrook and Yreka, took out another $100 in a day or two with a mortar. Dr. Taylor has an extension on his ledge. Crooker Bros. are about completing their wing dam at Anderson's Klamath river ferry. Horn, Smith & Co., one mile further down, are rapidly completing their wing dam. W. R. Price has bought the Oregon bar and is rafting lumber for a wing dam. The American Bar Company, who run their wheel over a suspended bridge, are getting ready. C. B. Gillson & Co. are busy piping their blue gravel.

BAKER COUNTY.—*Democrat:* Before the summer has far advanced the Payette river in the vicinity of Marsh will be the scene of great activity. A number of eastern capitalists have become interested in placer mines in that section and they propose to commence operations soon on an extensive scale.

The Denver company will commence work shortly on their high bars. W. W. Booth and other prominent Denver mining men are interested in this company and they will put in some elaborate machinery to raise the water to the bars.

John McKinley, of Duluth, who, with other gentlemen from that place, have secured control of a large tract of placer ground near Marsh, proposes to begin operations at once. A large dredge machine has been ordered and will arrive here shortly. The machine is said to have a capacity of 2000 cubic yards a day.

A clean-up was made a few days ago in the William & Corker mine at Neal, which was recently purchased by Mr. Balhach. The amount of the clean-up is not known, but the owner is more than satisfied with the result. Some remarkably rich ore is now being taken out of the mine.

It is reported that a rich strike has been made in the Denver mine at Neal, owned by Dave McNutt and J. Hudson. They have opened up a four-foot vein of good ore, some of which is said to be phenomenally rich. The Denver is but a short distance from the Homestake.

The mines of Baker county are making an excellent showing. Both placer and quartz properties are yielding handsomely and if indications do not fail the output rolled up this season will excel that of any two years combined in the past quarter of a century.

SOUTH DAKOTA.

TROUBLE IN A TIN MINE.—Albert R. Latoux has been appointed temporary receiver of the Harney Peak Tin Mining, Milling and Manufacturing Company.

The complaint accompanying the application for a receiver charges fraud against the trustees of the defendant company.

The Harney Peak Tin Mining, Milling and Manufacturing Company was incorporated April 16th, 1884, to do business in the Black Hills region of Dakota. An immediate issue of $5,000,000 was made at once to buy, as it is claimed, property worth only $17,000. On January 31st a second issue of $3,000,000 was made to Oliver F. Berry as trustee, and the following year a third issue of a like amount to Henry Clausen. The English complainants afterward took some of the stock, which they now say was issued to the trustees as a blind, and that the hooks were so juggled as to make it difficult to discover the fraudulent conspiracy and gains which they allege were divided among a syndicate of stockholders. An agreement was entered into by which the Englishmen obtained 90,000 shares of stock at $100, par value, in addition to $1,535,000.

A small sum of money was paid, but subsequent agreements were made by which the Englishmen were to issue £1,000,000 in bonds of an English company, giving security for the rest, which they failed to do, but $1,000,000 were put on the Black Hills property, which were issued to the English company in part pay and partly as security.

Another £1,000,000 mortgage was afterward placed and about 400 mining claims were purchased, but an attempt was made to work only 20 of them, and the only thing mined, according to an affidavit of George W. Hamilton, was 1000 tons of ore, which has never been treated. The Englishmen who had invested between £3,000,000 and £5,000,000, becoming suspicious, sent over agents to investigate, and, it is alleged, found that the American owners had put up only $280,000 in cash for all the property. Not more than $600,000, it is said, had been expended in working the mines and building the mills, and the English want to know where the millions went to.

UTAH.

A BIG ENTERPRISE.—S. L. *Tribune:* On July 12th it will be just six years since the big tunnel for the Ontario mine was started. From the outer end it is just 15,560 feet to the bottom of No. 3 shaft. Of this, 14,725 feet have been cut, leaving 835 feet yet to penetrate.

Progress the first two or three years was at the rate of ten or twelve feet per day while driving, but there were frequent stoppages on account of striking streams which flooded the tunnel so badly as to stop work for a time. Then there was the destruction of the power plant and some other things which stopped progress, but the worst feature has been ground which was extremely difficult to go through. Such places have been designated as "soft," because the water and broken stone, along with the sand, would run into the tunnel faster than possible for the men to take it away. Such places required a difficult and slow kind of piling, with great care in handling and putting in the timbering.

If the ground was solid it would take only a few months more to complete the tunnel, and then all water in the mine down to the 1500-foot level could be run out.

At present the tunnel is discharging between 12,000 and 13,000 gallons of water per minute. It has relieved the mine already, or at least the amount required to be pumped is much less than it was a few months ago. The big Cornish pump used to be run at a speed of eight strokes per minute. This has been reduced to five, making a big difference in the amount of fuel required to operate the pump. It requires about fifty tons of coal per day to furnish the steam for the Cornish pump and the several large pumps which raise water from the 1500-foot level up to the 1000-foot, where the Cornish pumps take it and raise it to the 600-foot level, where it runs out through the old drain tunnel. To operate these pumps requires about forty men, who are divided into shifts, and there is never a time but men are on duty.

With coal costing $6 per ton, and good wages to capable pump men, the reader can form some idea of the cost of getting rid of this water, an expense which will be saved to the Ontario and Daly mines on the completion of the new tunnel. These two mines are drained through the same medium and share in the cost thereof.

There is one feature of this great work which people do not generally understand. The question is often asked: "Is the Ontario and Daly going to shut down because of the price of silver?" Men are sometimes in the position of holding something they cannot let go of. These companies are just in that condition. To stop mining the half hundred or more miles of drifts, levels and stopes in the two mines would soon fill up with water, and that would cause almost if not quite total destruction. As it is now, it requires a large number of men constantly employed in easing timbers and putting in new ones. This latter work will have to go on as long as the property is held for production, even if it is not mined. When the drain tunnel is completed it will allow the big pump to stop running until the work has gone below the tunnel, and the water down to the 1500-foot level will simply run out, and the saving will soon pay for all the tunnel will have cost. While the pay roll and fuel bills will be materially lessened, there will most probably be but little if any change in the operations of the two companies, which will go on producing silver as in the past. The companies have too large interests and too much money invested to permit idleness of these two, among, if not the greatest, silver mines in the world.

THE COMSTOCK MINE.—*Tribune:* A short

time ago work was stopped on the Comstock mine at Park City. Manager M. Duseldorf is in the city and to a *Tribune* reporter he said that right after July 4th be would put 15 or 20 men at work to sink on the four-foot vein which was cut hy the tunnel at a point in 200 feet. This is good ore; hut as it is only about 50 feet under grouud at that point, it is too near the surface for good stoping, so he intends going down 100 feet and begin taking cut ore there. Besides the four feet of ore on the footwall, the vein has ten feet of red quartz, which it is expected will develop into good ore helow. Last week 7000 shares of Comstock stock wns sold in New York City at $1 per share, and there is a demand for more, which will place the company in shape to go down and then take out ore, from the sales of which they will get returns to put in machinery. Fortunately, there is no water aud no ueed of pump machinery at present. Numerous small seams of ore have heen cut in driving the tunnel.

Coast Industrial Notes.

The Fulton Engineering and Shipbuilding Works gave their new Sausalito ferryhoat a satisfactory trial trip on the 28th ult.

—The San Joaquin Lumher Company of Fresno has sold its improvements and stock of lumher to the Madera Flume and Trading Company.

—Several hundred employes of the Kings River Lumber Company, at the mills near Sequoia, Fresno county, demanded a reduction to only ten hours' work a day instead of eleven hours. The office in Fresno refused to comply with the demand, and sent word to close the mills.

—The San Francisco Tool Company has brought an attachment suit against the Piedmont Cable Company for $32,933, due on a note made May 1, 1893, attaching all of the personal property of the company left unsold after the recent attachment sale of the Oregon Improvement Company.

—By August 25th there will he a large smelter at Spokane. The deal has been concluded. The steel rails for the track are on the way from the East. While the new smelter company will not bear the name of the great Standard Oil Company, it is understood that it will he controlled by that great corporation.

—In building up and strengthening the bulkhead at the Cascade locks 3000 barrels of cement were used, which is a dead loss. It costs $2.50 per harrel, making for this one item of the expense $7500. When the labor and other expenses are figured up the cost of protecting the locks will reach in the neighborhood of $30,000.

—One hundred and thirty-quarrymen employed hy the San Francisco Street Improvement Company, contractors for the Government work being done on the jetties at Humholt har, went out on strike last Monday, demanding au advauce of 50 cents. The wages of the quarrymen were $1.25, $1.50, $1.75 and piledrivers $2.50.

—The South Yuha Water Company has hought the water rights of the old Fall Creek Compauy, and will use the ditches formerly used to convey water from the Blue, Rucker, Feeley, Culhertson and other small lakes to the head of the Blue Tent ditch, in the South Yuha canyon. The ditch will be used to lead water from all these lakes to the new Lake Spaulding, above Bear valley.

—At a recent meetiug of the Harbor Commissioners hids were received for supplying coal as follows: Dunsmuir & Sons, Comox coal, $6.38 per ton; Wellington, $7.24; J. Macdonough, Wallsend, $7; Black Diamond, White Ash and house coal, $5.80; Charles R. Allen, Nanaimo, $6.39; J. C. Wilson, Wallsend, West Hartley and Brymho, $6.75; Oregon Improvement Company, Franklin coal, $5.75.

—B. F. Peregrim, of Florence, Or., for nearly nine months has heen building a steam harge on novel lines, and expects to have it here by August 1st. It is a large doublehender, and will he propelled hy a wheel located in the center of the harge. The huilder's idea is to have a hoat that can compete in all kinds of husiness in deep water or on the small streams. His hoat will draw little water, and the owner believes that he will he ahle to enter the small streams opening into San Francisco hay, and dock how or stern first, as the case may demand, and his machinery and wheel are constructed on the plan of a ferry hoat, so that the hoat can run either way. The barge is to he fitted up with a large mast and swinging derrick, with which he will be enabled to run up aloug the levees on the river banks and easily load his freight. The lumher capacity of the barge is about 200,000 feet. It is intended to hring the harge down the coast under full sail.

In the U. S. sub-treasury, in this city, there was eash on hand on the 1st inst. as follows: United States notes, $22,269; treasury notes, 1890, $23,080; national bank notes, $29,460; gold certifieates, $5450; silver eertificates, $88,-215; gold coin, $10,949,476; standard silver dollars, $24,781,882; subsidiary silver coin, $930,277.15; minor eoin, $26,132.95; fraetional currency, $11; total, $36,856,253.10.

The Alaska Gold Placer mining Company has ineorporated, with a capital of $1,000,000, of whieh $625,000 has been subscribed.

Notices of Recent Patents.

Among the pateuts recently ohtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Ore Grinder and Amalgamator.—Charles N. Moore, Newhall, Cal. No. 521,663. This invention relates to an apparatus for grinding and amalgamating ores of rock containing precious metals. It consists of a pan having an inclined hottom and fixed central post with a standard about which the center of the pan is fitted to revolve, horizontal shafts extending outwardly from heneath the hottom of the pan, anti-frictional rollers upon said shafts, and flanges upon the bottom of the pan adapted to travel upon said rollers, a toothed gear surrounding the hottom of the pan, pinions upon the horizontal shafts engaging said gear, and mechanism wherehy the shafts are driven so as to transmit motion to the pan, together with grinding shoes or rollers movahle over the hottom of the pan, and gearing conuecting the rollers with the shafts so that they are driven in opposite direction from the movement of the central portion of the pan. Tbe ore is fed in through the eeuter and delivered hetweeu the rollers and the dies aud is thereby crushed. Screens around the sides of the pan allow the dust or pulp to pass out when it becomes sufficiently fiue, and it falls iuto a surrounding amalgamated copper trough.

Folding Crate.—Arthur W. Coats, Ukiah, Cal., assignor of one-half to James Bartlett of Ukiah. No. 521,640. Dated June 19, 1894. This inventiou relates to a crate of that class which is ndapted to be folded up iuto small compass for the purpose of transportation. It consists of a bottom having side strips permanently fixed upon it, sides having their lower edges hinged upon these strips adapted to open upwardly and outwardly about their hinges and to fold inwardly upon the hottom, slotted links with pins attached to the sides and slidahle in the links to retain the sides in a vertical position when opened, end sections pivoted hetween the permaneut supplemeutal pieces, side rollers adapted to turu ahout their hiuge hars either to fold upon the hottom or to stund in a vertical position and complete the sides and ends of the crate, and interlocking devices to hold the parts in position, together with hinged top sections meeting in the center, and means for locking the whole iu place, consisting of a single rod passing tbrough the sides and engaging the meeting ends of the tops, and vertical truss plates or rods to connect the center and ends of the box and prevent the central portion from sagging when there is considerahle weight in it.

Registering Toy Bank.—Arthur W. Coffin, San Francisco. No. 531,641. Dated June 19, 1894. The object of this invention is to provide a hauk or receptacle for the deposit of various coins from time to time, and a means for registering the amount of each deposit and the total amount contained within the hank, and a mechanism which will operate automatically to release the door wheu any desired amount has been accumulated within the hank, so that it may be removed at pleasure of the owner. The receptacle has a slotted opening at the top through which the coins are iutroduced, a slide controlling the entrance to the opeuing aud actuated hy the passage of the coin, and a mechanism actuated hy the slide so that its amount of movement shall he dependent upon the character of the coin deposited, and in connectiou with this a means for indicating the amount of the deposit, which consists of a toothed wheel, ratchet mechanism connecting with the movahle slide so that the ratchet wheel will he advanced a numher of teeth, dependent upon the varying diameters of the coins introduced. The movement of the wheel is communicated to an indicator or pointer moving over a numhered disk upou the outside of the hank so as to show the amount accumulated therein at any time upon inspection.

There is no necessity for piers or wharves at Ivigtuk (often erroneously called Ivigtut, says Prof. F. H. Knauff), where the vessels load cryolite for Philadelphia. The place is on the Arksuk Fiord, and so bold is the coast that the vessels make fast elose to the rocky walls by the bow, while at the stern they can get no soundings. The eryolite mine ean only be worked from April to October, and when it is abandoned for the winter it is filled with water, only the surface of whieh freezes to a depth of about four feet, whereas if it were left empty the gradual leakage would aeeumulate thousands of tons of solid iee during the winter, so that it could not readily be removed. In the spring the mine is simply pumped out and work resumed. The entire output is sold by the Danish government to the Pennsylvania Salt Co., who manufacture what is not used for aluminum into carbonate of soda and alum.

Considerable mining is being done in the bed of the San Antone ereek, near the old Dunbar saw-mill near the Big Trees.

LARGEST
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ills.; Dallas, Tex.

Educational.

INSTRUCTION BY MAIL
In ARCHITECTURE; ARCHITECTURAL DRAWING; PLUMBING, HEATING and VENTILATION; BRIDGE ENGINEERING; RAILROAD ENGINEERING; SURVEYING and MAPPING; ELECTRICAL ENGINEERING; MECHANICAL DRAWING; MECHANICS; ENGLISH BRANCHES, and
. . MINING . .
Diplomas awarded. To begin students need only to know how to read and write. Send for FREE Circular of Information, stating the subject you think of studying, to The Correspondence School of Mechanics and Industrial Sciences, Scranton, Pa.
4000 STUDENTS.

Belmont School,
BELMONT, CALIFORNIA,
25 Miles South of San Francisco.
Buildings heated from a central steam plant, and buildings and grounds lighted by electricity.
Boys perform their own experiments in well-equipped chemical and physical laboratories.
Gymnasium 28x79 feet, furnished with very best apparatus, including shower baths, under special teacher of physical culture.
Scholarships for young men of fine character and ability. Accredited at Stanford and at the University of California in all the subjects of all the courses and in advanced physics, chemistry and mathematics.
References required. Views of Belmont School and Catalogue sent by applying to W. T. REID, A. M. (Harvard), Head Master.

ACTUAL BUSINESS PRACTICE.
Established 1863. PACIFIC Business College, 320 POST ST. SAN FRANCISCO. Day and Evening Sessions.
Rates of Tuition Very Moderate.
Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, President.

HEALD'S
Business College,
24 Post Street, - - - San Francisco.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

A LARGE, VALUABLE
Gold Mining Property
FOR SALE CHEAP.
A GRAND OPPORTUNITY NOT EASILY DUPLICATED. Actual value many times the price asked.
Situated in Nevada County, California, and consists of a group of four mines, all strong, heavy veins. Only partially developed. Ore free milling. Over $90,000 past yield of ore from one mine alone.
Must be sold within 30 days to close out an estate. Price, $50,000. Terms, $5000 cash; balance easy installments, or 20 per cent of gross proceeds, to suit purchaser.
Machinery on the ground worth cash payment asked. For prospectus and particulars, please address:
S. B. FOWLER,
Grass Valley.....California.

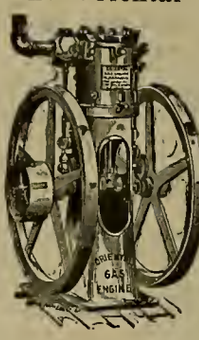
The Oriental Gas Engine


IS THE BEST, because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.
It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.
Send for circulars and prices if a good safe engine is what you need.
The Oriental Launch is Perfection.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt, will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Electrical Progress.

Electricity in Iron and Steel Works.

At the May meeting of the British Iron and Steel institute, D. Selby-Bigge presented a paper on "Electricity as a Motive Power in Irou and Steel Industries." After showing how electricity has been utilized in iron ore mining the anthor said:

"There may be some at this meeting who may think that the author now proposes to work blast furnaces by electricity. He regrets, however, it is not yet in his power to revolutionize the world by doing this. He would, however, seek the aid of blast furnaces in generating his electricity, and considers that, after a waterfall, a Cleveland furnace is the next best friend to those desirous of generating electric power economically. In many cases there are large amounts of waste gases available from the furnaces. These are generally used for firing the boilers necessary for driving the blowing-engines, etc., but there is frequently a considerable amount of waste gas left over. It is with this waste gas he would propose firing the boilers in connection with the electric generating plant. The power thus generated could be transmitted at a high tension to engineering works sitnated at a considerable distance and, if necessary, transformed again to a lower tension for use in the works. By short distance transmission the author means the distribntion of electrical energy for the purposes of driving engineering works. As already mentioned, there has hitherto been a tendency on the part of engineers to consider electricity as applicable only in those cases where the power has had to be transmitted over a long distance. It is now necessary to consider quite a different case, in which the power has only to be transmitted over distances not exceeding 200 or 400 yards in leugth, bnt in which area a mnltiplicity of uses may be fonnd for the application of electric power to driving various classes of machinery.

"First of all, let the case of iron and steel works be taken, and the classes of machines most freqnently employed in these works be considered. These will be fonnd in a great measure to consist of the following: Punching and shearing machines, straightening machines, cold and hot saws, drilling machines, planing machines, blowers, overhead travellers, locomotive cranes, rolls, winches, scrap breakers, etc.

"In connection with iron and steel works there are frequently found girder shops, fitting shops, etc., in which the machinery is driven through shafting aud belting off one or more engines situated in the shop. In laying down machinery of the above class it has almost invariably been the practice, not only when the machine tools are driven by separate engines, but also when they are driven by belting and shafting, to make allowances in these engines for very large losses, due to condensation or leakage in steam pipes, or to friction caused in the belting and shafting. It is a well-known fact that the power actually expended in performing the work on these various machines is a mere fractional part of that transmitted from the generating source. In those cases where the machine tools have been driven by separate engines, it has been a regular practice to provide engines with cylinders sufficiently large to compensate for any possible losses which may occur throngh leakage, condensation, etc. It seems generally to have been the practice in engineering works to indicate the main driving engines, but during the author's visits to some 30 or 40 of the principle engineering works in this country, he has never been able to obtain indicator diagrams showing the power absorbed by each steam-driven machine tool in the works. Althongh attention has been paid to the economy of the main engines, the qnestion of that in the small engines driving these machine tools, and the conveyance of steam, has often been entirely overlooked, and an enormous waste has been going on in this manner for years past.

"With the advent of the electric motor this condition of things was at once changed. Every electric motor may be said to be a self-indicating machine in itself, in that the power which it absorbs can be immediately detected through the readings on the ammeter and voltmeter provided in connection with the motor.

"The followiug are results of experiments that have been recently carried ont by the anthor, in conjunction with Mr. H. Panton, on the actual power absorbed by various machine tools in doing their work. The fignres are extremely interesting, as showing the very small amount of power absorbed by the different tools when doing their work:"

Table of Electric Motor Tests taken at the Works of Messrs. Dorman, Long & Co., Middlesbrough.

Description of Machine.	Driven by Engine Capable of Indicating.	Replaced by Motor Capable of Indicating.	Voltage at Generator.	Voltage at Motor.	Current taken by Motor.	E. H. P. Absorbed in doing Work.
Group of Machines as under—	H P	H P			Amperes	Per Cent.
Three cold saws.. Two ending machines..... One saw-sharpening machine.....	27	10½	120	115	70	10.7
Troughing straig't-ening machine.....	14	3½	120	118	12	1.9
Double-ended punch, punching four holes one side and one other.....	14	5	120	115	25	3.7
Straightening machine, all sections.....	14	3½	120	115	15	2.3
Straightening machine, biggest sections....	16	3½	120	115	35	5.4
Cold saw, 26 inches diameter.....	9	3½	120	110	15-27	2.2 & 3.9

The saving in coal effected on above machine tools amounted to 30 tons per week, after the adoption of the electric system.

CITY AUTHORITIES may pass ordinances regulating car speeds withont end, bnt it is asking too mnch of a motorman to calculate or even to gness at the speed of his car in addition to his other exacting duties. What is wanted is a simple and reliable speed indicator, which will enable a motorman to tell at a glance how fast he is running. The *World's Progress* believes that its introdnction will be followed by a reduction in the nnmber of trolley accidents, and that the cost would be but a bagatelle compared with the redncion in the amounts now paid for damages.

THE second century of the electric age has begun this year. The discovery of Volta was first published in a scientific journal at Pavia, where he was professor. Volta's theories are not exactly followed by modern scientists, bnt his pile is in all hands, and it was the origin of that extraordinary development in the application of electricity that has transformed international and social relations, and added an altogether new phase to hnman life. Perhaps Volta's discovery has been the most frnitfnl in its effects of any that has ever been made.

"I ONCE HAD TO RUN into Chatham island, in the South Pacific ocean," says an old sea captain, "and was amused to see the way in which the people accepted their fate in regard to the jumping of time. This little island is just on the line of demarcation between times and dates. In order to keep right with the remainder of the world, it is necessary to skip from noon on Sunday to noon on Monday every week in the year, and hence the joke that it is possible to spend a whole day at dinner withont eating an average meal. The island is so near the antarctic region that days and nights are altogether mixed up from the idea of an ordinary individual, but this plan of jnmping the afternoon of one day and the morning of the next, so as to keep in line with the almanac, is something so ridicnlons that none bnt a seafaring man can appreciate it or understand the necessity."

The Patio Process in Mexico.

The usual practice in Mexican haciendas de beneficio is as follows: The ore is first crushed dry in Chilian mills to the size of peas. These mills are provided with a single stone runner eight feet in diameter and two feet thick, and are generally turned by mules, althongh another form, with two small runners and actnated by steam power, is coming into favor. The crnshed ore or granza then goes to the arrastras, of which there are never less than 30 iu a hacienda, each being able to treat abont two cwts. per day. These machines are wonderfully simple, and yet they are extremely efficieut; no iron enters into their composition, for stono, hardwood and rawhide take the place of metal. The mullers and bed are made of blocks of a peculiarly tough kind of porphyry, and the toothed wheels which tnrn the vertical shaft of the mill are made entirely of mesquite wood. Each arrastra requires two mules to drive it, but in some haciendas steam is used instead.

It is donbtful, however, whether steam power here is mnch of an advantage under Mexican conditions, especially considering the large amount of shafting and gearing required for snch a number of small mills. It is in the arrastras that the Mexicans recover what they do of the gold contents of their ores, for in the torta afterwards no gold is found in the silver. Copper amalgam is introdnced into the bed of each mill; a cleanup is made every two or three months, and the result is an alloy of copper, silver, and gold containing about 10 per cent of the most precions metal, but the gold extraction is not more than 30 or 40 per cent of the assay valne. The tailings from the torta are also concentrated by hand, and the washed prodnct may contain 10 onnces or so of gold per ton. These concentrates are generally sold to the smelters.

The pulp from the arrastras is run out into settling tanks, and npon attaining the proper consistency is transferred to the patio, where salt, sulphate of copper, and mercury are added, and the mass trodden at intervals by mules. In this stage the two conditions of success are hot sunny weather, and adequate skill on the part of the azoguero or foreman. With plenty of sunlight and heat the amalgamation is quickly completed, and the torta is ready for washing off in abont a fortnight, but in cold, cloudy weather the process may last six weeks, and the extraction will not be so perfect and the loss of mercury much greater. The usual consumption of mercury is a pound and a half for every pound of silver recovered. The greater portiou of this is washed away as calomel, and the remainder is lost mechanically.

The ores are mixed to contain abont 20 ounces of silver per ton, and hence the average loss of mercury is 2½ pounds. In this respect the patio compares unfavorably with pan amalgamation, in which, npon the same ores, the consumption of mercury never exceeded a pound and a half per ton, and was often less. The patio also requires more salt than the pan—*i. e.*, 5 per cent of the weight of the ore against 2 per cent, and the amount of sulphate of copper required is also larger. The total cost, however, of the two processes in Mexico is nearly the same—about $10 to $11 per ton—but in large establishments the cost will be reduced below this figure. If it were not for the high price of fuel and machinery renewals the pan would be vastly more economical than its older rival; bnt under present conditons the principal advantage of modern milling is the great economy of time in gettiug the bullion from the ore.

Further, the scope of the patio process is somewhat limited; clean sulphide ores containing but small amonnts of rnby silver, polybasite, etc., certainly yield 90 per cent, and, in exceptional cases, 95 per cent in the torta, but the slightest per cent of lead, zinc or antimony at once seriously lowers the extraction, increases the mercury loss, and renders the method inapplicable. Chloride and bromide ores do not give up their silver readily to patio amalgamation, and the percentage is not likely to be over 70.

A good furnitnre polish, which gives a soft, oily finish to furniture and woodwork, is made of one scant ounce of linseed oil, one full ounce of tnrpentine and three-fourths of an ounce of cider vinegar.

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 22 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

Practical Information.

How Granite Columns Are Turned.

According to the census reports, granite for columns, balusters, round posts and urns is now worked chiefly in lathes, which for the heaviest work are made long enough to handle blocks 25 feet long and 5 feet in diameter. Instead of being turned to the desired size by sharp cutting instruments as in ordinary machines for turning wood and metal, granite is turned and ground away by the wedge-like action of rather thick steel disks, rotated by the pressure of the stone as it slowly turns in the lathe. The disks, which are six or eight feet in diameter, are set at quite an angle to the stone, and move with automatic carriage along the lathe bed. Large lathes have four disks, two on each side, and a column may be reduced some two inches in diameter the whole length of the stone by one lateral movement of the carriage along the bed. The first lathe is for turning granite cut only cylindrical or conical columns, but an improved form is so made that templets or patterns may be inserted to guide the carriages, and columns having any desired swell may be as readily turned. For fine grinding and polishing the granite is transferred to another lathe, where the only machinery used is to produce a simple turning or revolution of the stone against iron blocks carrying the necessary grinding or polishing materials. Blocks are prepared for lathe work by being roughened out with a point, and by having holes chiseled in their squared ends for the reception of the lathe dog and centers. This principle of cutting granite by means of disks revolved by contact with the stone has been applied to the dressing of plane surfaces, the stone worked upon being mounted upon a traveling carriage and made to pass under a series of disks mounted on a stationary upright frame.

The Construction of a Coat and Vest Requires a Deal of Labor.

That a lady's dress is a thing fearfully and wonderfully made is a fact that can be testified to by every man who has ever tried to get something out of the pocket when it was hanging up in the closet. But a man's coat and vest are themselves by no means simple affairs, but are the result of more labor than any person not acquainted with the details of the tailor's trade imagines, remarks a writer in the Indianapolis *Sentinel*.

A coat-maker has taken the pains to count the number of stitches necessary in a coat and vest recently made by him. The coat was a single-breasted, three-button cut-away, and the vest of the present pattern. He found that to complete the coat required exactly 33,356 stitches, and in the vest 11,527. For the benefit of those who may be interested in the figures, these totals represented the following: Bastings for the coat, 2575; for the sleeves, 642; for the pockets, 183; for the collar, 392; total, 3792. Hand stitches on the coat, 8501; on the sleeves, 1646; on the pockets, 396; on the collar, under and upper, 2913; total, 13,456; machine stitches, on the coat, 7578; on the sleeves, 3600; on the pockets, 2720; on the collar, 396; total, 14,294. Button holes (gimp holes), 1814. Bastings on the vest, 1469; hand stitches, 2573, and 460 on the pockets; machine stitches, 3654, beside 3022 on the pockets and 349 for the button holes; total, 11,527. The machine stitches were counted at the rate of 18 to the inch. On a coat and vest, then, there are required nearly 50,000 separate and distinct stitches. The old proverb that "nine stitches make a man" is thus proven to be wofully short of the true figures.

A CURIOSITY that is puzzling all comers was recently found at Wallace, Idaho, by William Hiltz, the section foreman on the Northern Pacific. It has the exact appearance of an apple, two and one-half inches in diameter, and is of a dark red color, inclining to black. Upon being sawed through, the color, consistency and density were found to be almost identical with ivory. It is believed by many to be a petrified apple, but it does not possess any mineral characteristics. It resembles vegetable ivory in consistency. It was found in the gravel at a depth of ten feet, which still further adds to the complexity of the conundrum.

Modern Explosives.

The compositions of some of the modern high explosives are as follows:

Dynamite.—Seventy-five parts of nitro-glycerine and 25 of infusorial earth.

Dualine.—Eighty parts nitro-glycerine and 20 of nitro-cellulose (gun cotton).

Rendrock.—Forty parts nitro-glycerine, 40 of nitrate of potash or soda, 13 of cellulose and 7 of paraffine.

Giant Powder.—Thirty-six parts of nitro-glyceriuc, 48 of nitrate of potash or soda, 8 of sulphur and 8 of resin or charcoal.

Mica Powder.—Fifty-two parts of nitro-glycerine and 48 of pulverized mica.

Tonite.—Fifty-two and one-half parts of gun cotton and 47½ parts of nitrate of baryta.

Blasting Gelatine.—Ninety-two parts of nitro-glycerine and 8 of gun cotton.

Atlas Powder.—Seventy-five parts of nitro-glycerine, 21 of wood fiber, 2 of carbonate of magnesia and 2 of nitrate of soda.

Rackarock.—Seventy-seven and seven-tenths parts of chlorate of potash and 22.3 of nitro-benzol.

It will be noticed that nearly all the explosives are composed principally of nitro-glycerine; and it is probable that in most cases the other ingredients only act as absorbents for this liquid, and really add nothing to the explosive force. The decomposition of nitro-glycerine is practically instantaneous, and the slower-acting nitrates and hydro-carbons must be left far behind when the mass is exploded. The power of all these substances is due to the paradoxical element, nitrogen, which is by itself the most neutral and inactive of all the elements, but, when forced into chemical combination, usually confers an element of weakness upon the entire molecule of which it forms a part.

AN INVENTOR has brought out a rocking chair that is actuated by electricity. The sitter can at the same time receive gentle currents by grasping metal handles or by resting the bare feet on metal pedals.

The Blasdel Concentrating Belt Co.

WE are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over **any others** will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

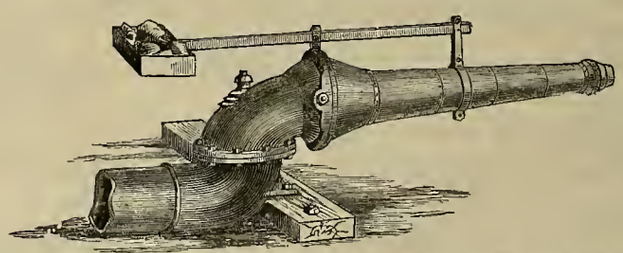
IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

DOUBLE-ACTING

Cornish ★ Plunger.

PUMPS TWICE AS MUCH WATER AS THE OLD PLUNGER. Only about one-third the weight of the old Plunger. Special construction of steel for packing on mules, only one-twelfth the weight of the ordinary Plunger. First outlay one-third less; works with 10 per cent less power.

IMPROVED SINKING PUMP.—Bucket and clack changed under water. Bucket lasts six times as long as the old one, saving expense of putting down another pump where bucket and clack cannot be changed under water. The self-tightening and self-lubricating stuffing box and new bucket also saves expense of dropping extra pumps. WM. NANCE, Grass Valley, Nevada County, California.

Market Reports.

The Markets.

SAN FRANCISCO, July 5, 1894.

The demoralization of midsummer trade is usual; the apathy consequent upon a national holiday is ordinary, but when coupled with these two comes a railroad strike, lock-out, tie-up and boycott, stopping all trade, mail and traffic communication, the combination is a paralyzing one. Nothing has been done during the week that didn't do itself.

New York Prices.

NEW YORK, July 5.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.
Thursday	28⅝	62⅝	....	....	....
Friday	28¾	62¾	9 00	3 20	19 50
Saturday	28⅞	62¾	9 20	3 20	.....
Monday..	28¾	62½	....	....	....
Tuesday	28¾	62⅞	9 20	3 20	19 50
Wednesday	28¾	62½	....	....	....

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, per cent per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt-edged	7@8
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	7
New York Sight Draft	7½c
New York Telegraphic Transfer	15c
London Bankers', 60 days	$4.86¼
London Merchants	$4.89¾
London Sight Bankers'	$4.89¾
Refined Silver, per ounce	62½
Mexican Dollars, nominal	52@52½

Local incorporations disbursed dividends during June as follows: Banks, $73,500; gas companies, $74,166; Water companies, $73,500; powder companies, $19,500; street railroad companies, $11,000; mining companies, $100,950; miscellaneous companies, $25,200; total, $377,816.

It is thought that during the month of June $3,000,000 in gold was shipped from Bombay to London. That fact indicates the failure of the Indian Government's recent financial experiment. India is not, as a whole, greatly affected. While in common with all the rest of the world gold as a commodity has appreciated in value, the purchasing power of silver has not depreciated. The effort to create a gold standard in India has resulted in nothing but congestion of the yellow metal in the vaults of the Bank of England. In 1873 the value of a "tola" (180 grains troy) was 15¼ rupees. It is now worth 31 rupees in silver. European tactics do not work as well in the case of dependent India as independent America. India prefers silver to gold, as the result shows, whatever "natural law" or any other law may say or do to the contrary.

Mining Share Market.

SAN FRANCISCO, July 5, 1894.

The railroad complication, the prevalent dullness and the week's holiday have made the week a blank in the mining share business. Everything went down all along the line in June. The up and down of all is illustrated by Con. Cal. & Va. fluctuations, which varied from $2 in March to $9 in May and $2.70 last month. On the Comstock as an entirety the depreciation in value, as represented by list quotations in the last two months, is over three and one-half millions.

The case of Fox *vs.* the Hale & Norcross *et al.*, involving about $1,250,000, and which was recently transferred from Department 2 to the court in banc, will be argued this month.

According to financial statements filed on the 1st, the following companies had cash on hand on that date:

Alpha $8616.45, Best & Belcher $21,074.56, Chollar $10,413.31, Challenge $10,413.31, Church $16,459.65, Con. New York $3394.73, Con. Cal. & Virginia $47,899.29, Caledonia $6339.31, Confidence $4576.22, Exchequer $4698.47, Gould & Curry $5333.81, Mexican $736.68, Ophir $16,576.70, Overman $2715, Occidental $573.19, Seg. Belcher $124.11, Savage $3414.08, Union $3133.08, Utah $1559.03, Alta $6530.85, Bodie Consolidated $37,044.45, Belcher $17,046.17, Brunswick Consolidated $3444.22, Bulwer Consolidated $4902.01, Crown Point $14,402.68, Consolidated Imperial $2416.83, Hale & Norcross $26,180.01, Julia Consolidated $1385.75, Lady Washington $140.14, Mono $3467.26, Potosi $3524.78, Standard Con $37,920.29, Syndicate $940.36.

The following mining companies report having had an indebtedness June 30, 1894: Belle Isle $1536.90, Del Monte $29,760.38, Independence $246.10, Navajo $191.33, North Belle Isle $1701.93, North Commonwealth $1905.41, Silver King $292.

The following illustrates the changes of the week:

Victor, Colorado	15,000	45,000
W. Y. O. D., California	.....	15,000
Zion M. Co., Nevada	10.000	10,000
Totals	$435,350	$3,764,471

Twenty-five mines paid dividends in May, amounting to $885,100.

The above is by no means complete, as mail interruptions consequent upon the strike have delayed our regular reports.

Simple as the operation may seem, there is a way to clean windows and a way not to cleau them. The following suggestions may bc of use to some, as they save both time and labor: Choose a time when the sun does not shine on the wiudow, else it will dry streaked, and uo amount of rubbing can prevent it. Brush off all the dust inside and out. Clean the wookwork around the glass first. Use for this warm water and ammonia; do not use soap. Wipe dry with cotton cloth. Do not use liuen, as it leaves lint on the glass when dry. Polish with tissue or old uewspaper.

It is trial that proves one thing weak and another strong. A house built on the sand is, in fair weather, just as good as if builded on a rock. A cobweb is as good as the mightiest cable when there is no strain upon it.—H. W. Beecher.

The less water there is in a bottle, the more noise it makes coming out. Some men are like bottles.—Anon.

It is not enough to have great qualities; we should also have the management of them.—La Rochefoucauld.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

P. & B. PAINT.

Absolutely Acid and Alkali Proof.

For CHLORINATION WORKS and Preserving Wood and Iron from Acid Attack, Rust or Decay.

P. & B. ROOFING.

DEWEY & CO.'S

Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

The World's Gold and Silver Production for 20 Years.

The changes in the world's production of gold and silver during the last two decades are shown in the following table, which is taken from the last report of the Director of the Mint, with the exception of the figures for 1892, which are revised in accordance with Mr. Preston's estimates, and the figures for 1893, which are taken from his report just submitted to Congress:

PRODUCTION OF GOLD AND SILVER SINCE 1873.

Calendar years.	Gold.	Silver coining value.
1873	$36,200,000	$81,800,000
1874	30,750,000	71,500,000
1875	37,500,000	80,500,000
1876	103,700,000	87,600,000
1877	114,000,000	81,000,000
1878	119,000,000	95,000,000
1879	100,000,000	96,000,000
1880	106,500,000	96,700,000
1881	103,000,000	102,000,000
1882	102,000,000	111,800,000
1883	95,400,000	115,300,000
1884	101,700,000	105,500,000
1885	108,400,000	118,500,000
1886	105,000,000	120,600,000
1887	105,775,000	124,281,800
1888	110,197,000	140,705,000
1889	123,480,000	162,150,000
1890	118,848,700	172,234,500
1891	120,183,500	189,446,800
1892	146,297,600	197,230,500
1893	155,521,700	207,895,400

It will be seen from this table that the value of the gold produced in the world in 1893 exceeded the value of that produced in 1873 by nearly $60,000,000, while the coiniug value of the silver produced in 1893 exceeded that of the silver produced in 1873 by over $126,000,000. Of course it is to be recollected that the commercial value of silver has not kept pace with its coining value in the two decades that that have elapsed since 1873. It will be noticed also that the increase in the value of the silver product has been on the whole more steady than that in the value of the gold product. The increase in the production of gold since 1873, it may be remarked, has been altogether owing to other countries than the United States, for the product of the latter country in 1893 was actually a trifle less thau that for the year 1873.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient economical and speedy for all Pacific Coast patrons

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works or science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T Dewey, W. B. Ewer and Geo. H Strong) this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Emigration from the United States.

In an interview with a reporter of the New York *Sun* the representative of the Hamburg-American line declared the number of steerage passengers going to Europe from this country within five months was surprisingly large as compared with the same period of 1893. In the case of the Hamburg-American line the increase has been almost 80 per cent. The representative of the Anchor line reported that the exodus by his line had never been equaled, and was 125 per cent greater during the first five months of the present year than during the same time in 1893. One of the vessels of the Red Star line on her last voyage brought in 80 immigrants and returned with 450. The French line reports almost the same condition of affairs. The North-German Lloyd, while not carrying so many eastward as some of the other lines, reports a decline of about 100 per cent in the westward-bound emigrant traffic. The Cunard line's eastward emigrant business increased about one-third over the figures of last year for the period named. This is the first year in the history of the traffic when the outgoing steerage passengers outnumbered the incoming.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

DIVIDEND NOTICE.

The German Savings and Loan Society,
526 CALIFORNIA STREET.

For the half-year ending June 30, 1894, a dividend has been declared at the rate of five (5) per cent per annum on Term Deposits, and four and one-sixth (4 1-6) per cent per annum on Ordinary Deposits, payable on and after MONDAY, July 2, 1894.

GEO. TOURNY, Secretary.

CLEAR CREEK, OREGON.

The First CRAWFORD Mill in Oregon has been erected at the Red Boy mine. Trial run of 22 days showed 220 tons treated, yielding over $200, bullion, a saving of 85 per cent. Wear and tear, 20 cents per ton. No plates or screens. Simplest, cheapest and most economical mill on the market. *Special terms offered the first mill introduced in any mining district.* Oregon Agent, E. J. GODFREY, Baker City. Full particulars from

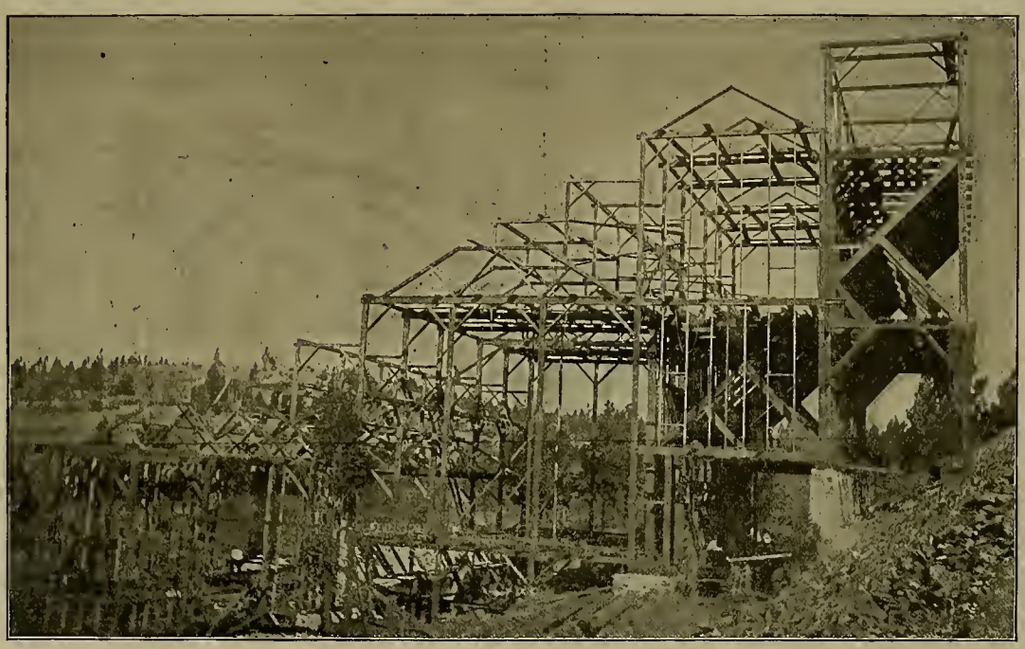
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 2.

SAN FRANCISCO, SATURDAY, JULY 14, 1894.

THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

CONSIDERABLE stress is laid on the fact that the hundred-million gold reserve is cut down to 64,000,000, and wonder is expressed by Secretary Carlisle and others as to the best means of preventing such depletion. As the Treasury Secretary is credited with an unwillingness to issue any more bonds (which is virtually putting a premium on gold), it is in order to suggest how he can at least check daily depredations in the Treasury reserve. The popular supposition is, that the "hundred-million reserve" is kept separate from other Government Treasury assets. It ought to be, but it isn't. The check to the lowering of the gold reserve is to act in the interests of the Government, and not in the interests of those who make the matter one of traffic and speculation. The Secretary of the Treasury has fallen into the careless habit of using the proceeds of the gold reserve to pay the excess of expenditure. The practice is a loose one, and is not consonant with ordinary rules of private business integrity. The legal tender notes which are redeemed from the gold reserve are turned into the general fund, which is simply a proclamation to all and sundry of a way to increase the public indebtedness. Secretary Carlisle, if he wants to, can at any hour begin to put a stop to such perversion of law and common sense by holding the legal tenders as they are presented and redeemed, constituting them a part of the reserve till they are called for in exchange for gold, when they would be reissued. This is what was contemplated by the law when framed. Were Mr. Carlisle to so naturally and fairly interpret the law, the demand for gold upon presentation of such legal tenders would not be of long continuance, such action being checked by the contraction of the note supply. Just so long as speculators can draw out gold and greenbacks both, just so long will the drain go on and the "reserve" be in such a state of depletion as to threaten the necessity of another issue of bonds. The dispatches of the week announce that during the fiscal year ending June 30th the public debt has increased over $50,000,000. This is largely due to the present system of handling the gold reserve, a pernicious practice which could be changed as indicated.



NORTH STAR MILL IN PROCESS OF CONSTRUCTION.

NORTH STAR MINE, GRASS VALLEY, CAL. — *See page 42*

RECENT reference was made to a long letter sent to the U. S. Debris Commission by the Anti-Debris Association, in which that organization made proffer of their paid spies. Fitting and dignified response has been made the proposal, in which is the following paragraph: The Commission expresses its obligation for your offer to place at its service certain of your employes, without cost. Whenever an occasion shall arise making it expedient to accept this offer, the Commission will be under further obligation.

THE annual report of the Secretary of Mines of Victoria, Australia, for '93 is received. There is a little new statistical and general information in it, the space being largely devoted to descriptions of American mining machinery, taken from the columns of the MINING AND SCIENTIFIC PRESS and other mining journals. The gold yield of the colony for the year was 671,127 ounces, an increase of 16,670 ounces as compared with '92.

IN the ordinary acceptation of the term "a mine" is a mineral claim or location, though strictly speaking it is subterraneous work with the object of extracting metal ore, or other mineral substance. It is clear that the word "mine" can not be correctly applied to an undeveloped claim, though it is usual to speak of such a claim as a mine, the same as of a real "mine" on which work has been done, and on which are buildings, machinery, and mining appliances. There have been over 40,000 mining claims taken up and recorded in Nevada, and probably as many more in California, but the number of actual "mines" in the two States would hardly require five figures to express them. This is one of the cases where there is a distinction with a difference.

AT the beginning of the present deplorable public trouble, United States Attorney-General Olney gave an interpretation of the Government mail laws that implied a Pullman car was as necessary as a two cent stamp to rail transmission of a letter. United States Attorney Denis of Los Angeles subsequently made a ruling directly in opposition to his superior, but manifestly more in accordance with the plain rights of the public, to the effect that the Southern Pacific Company must move the mails without Pullmans, if the latter cars could not be handled. It is not probable that Attorney Denis will hear harshly from Washington. Even this Administration must certainly fail to see that Olney's dictum cannot stand, and that the rights of the American people cannot be checked by attempted Government complicity with the strained interpretation of Government contracts.

EVERY report from the South African gold fields is to the effect that so far as concerning men who work for wages, that country is a poor place for white men. Native labor is very cheap, and many men who have gone to South Africa in search of work at living wages are reported destitute and desirous of getting away.

Coast Industrial Notes; A Smelter in the Kootenay, 30.

THE railroad paralysis has occasioned a general revival of days and means of thirty years ago, and boats, stages and horseback have been utilized for the last two weeks in mail and passenger communication throughout the State.

THE admission of Utah, which but awaits the President's signature, will be of direct benefit to the mining resources of that section. Had it not been for Mormonism, and other political complications, Utah would have been in the Union twenty years ago, and her admission now is but an act of deferred justice to a prosperous and prominent part of the nation.

THE present railroad paralysis makes many things expensive and inconvenient for dwellers and sojourners in the mining regions and elsewhere. Mail is slow, provisions higher, and transportation expensive. A private letter from Boulder Creek, Santa Cruz county, says that one man paid $30 for a conveyance to take him from there to Santa Cruz; another gave $70 to be taken to Haywards, a distance of eighty-one miles. The only people in California at all favored in these troublous times are dwellers on lines of water travel.

THE Goldbank mine at Forbestown, Butte county, is a good example of what patient development can do. The owners of the property had the nerve and financial ability to stay with it, and though they were out $150,000 before it began producing, their expectations have been amply justified. It is calculated that there is now at least four years supply of ore in sight. The ledge averages from five to twenty-five feet in width. About 100 men are now employed. It is the intention to run a tunnel on a lower level, avoiding the hoisting, and build a much larger stamp mill lower down the canyon from the site of the present forty stamp mill.

IT had been proposed to take steps toward retaining for permanent and appropriate exhibition in this city the splendid exhibits from the several mining counties at the Midwinter Fair, but it was finally decided to return all the ore to the counties from whence they came, that proving to be the generally expressed wish of the donors. The model quartz mill near the south entrance to the Mechanic Arts Building has recently crushed some of the rich ore which the State Miners' Association did not care to remove, and it is proposed to have a gold medal struck from the product in commemoration of the greatest mining display ever made in California, or, probably, the entire world.

A Case of Interest.

Wyoming Con. Mining Co. vs. Champion Mining Co.

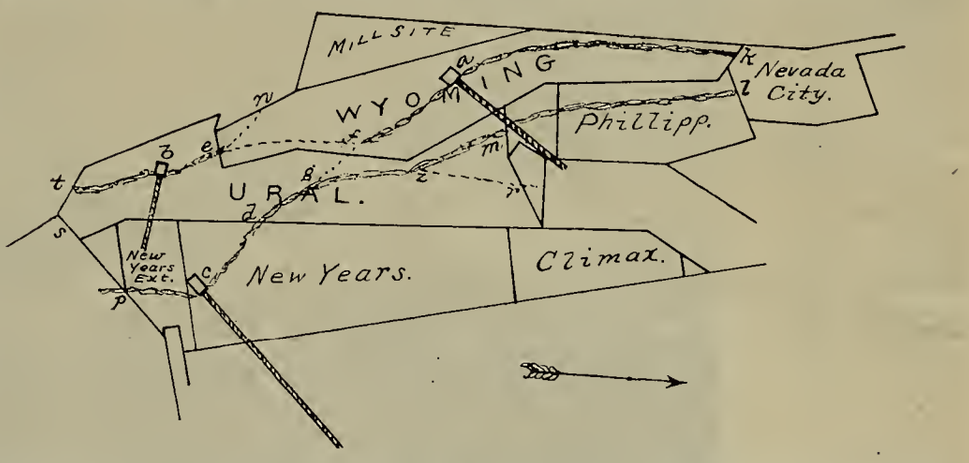
This cause, which was tried before Judge Hawley, U. S. Circuit Judge of Nevada, sitting for Judge McKenna in this city in the month of May, regarding mining property in Nevada county, California, involves a number of fine legal points, questions of fact, however, being woven into the cause.

A brief statement of the cause and contentions as developed on the trial may be given as follows: The plaintiff sues for an injunction to restrain defendant from working on a vein claimed by plaintiff and for an accounting for the value of ores claimed to have been removed.

The plaintiff is the owner of the claims shown on diagram as the Wyoming and Ural, title U. S. patent, issued subsequent to May 10, 1872, but based on locations prior to that date.

The defendant is the owner of the New Years and New Years extension claims. Title U. S. Land Office Receiver's receipt for a patent, based on locations subsequent to May 10, 1872. There is no conflict as to surface rights.

In the year 1885 these same parties were involved in litigation, the cause being tried in the Superior Court of Nevada county, the judgment of the court being affirmed by the Supreme Court of California. The litigation then being as to the rights of the Phillipp claim owned by defendant and the Wyoming claim, but all of the property involved in the present action was also included in the former action, and the judgment in said cause was introduced by plaintiff.



Extending through the claims of both parties is the apex of a vein known as the contact or Ural vein, dipping to the east, with granite for a hanging and slate for a foot wall; shown on the diagram at *p*, *d*, *m*, *l*. Crossing the line between the Ural claim of plaintiff and New Years claim of defendant at point *d*, and crossing a north line of the Ural claim at the point *m*. A branch of this vein extends into the granite from *z* to *r*, crossing line *r*. At the point *c* the defendant has sunk an incline shaft on the contact vein, 1000 feet deep on the dip, and has worked extensively the vein.

Lying to the west of the contact is a vein which near the surface is entirely in the slate, and is known as the Wyoming vein. On this vein the plaintiff has sunk the incline shafts *a* and *b*, with extensive underground works. The works of the shaft *b* of plaintiff on Wyoming vein, intersecting the works from the defendant's shaft *c*, on contact vein. Plaintiff claims that the apex of the Wyoming mine follows the line *t*, *b*, *e*, *f*, *a*, *k*; and that said Wyoming vein on its dip unites in depth with the contact vein, and forms a junction therewith.

The defendant denies the existence of such a junction, and claims the apex of the Wyoming vein to be two distinct portions, following the line *t*, *b*, *e*, *n*, and the line *g*, *f*, *a*, *k*.

The contentions of the plaintiff are that it is entitled to: First, the Wyoming vein, from the point *k* to *e*, with the right to follow said vein on its dip to any depth within perpendicular planes passed through the end-lines *k* and *e* and their continuation, also to the united vein below its junction with the contact vein. Second, to the contact vein from the point *m* to the point *d*, with the right to follow said vein on its dip; being limited by a perpendicular plane passed through the line *r*, and a perpendicular plane passed through the point *d* and parallel with the line *r*. Third, to the Wyoming vein, from the point *t* to the point *e*, with the right to follow said vein on its dip, within a perpendicular plane passed through the line *e*, and a perpendicular plane passed through the point *t* parallel with the line *r*, until said latter plane intersected the line *s*, *p*, when it should be followed.

The contentions of defendant were: That said Wyoming vein does not unite on its dip with the contact vein. That the plaintiff has no right to follow the Wyoming vein outside of the side lines of said Wyoming claim, because the end lines of said claim are not parallel, and that the vein passed through a side line, and has no extra lateral right on the dip of said vein. That the line *d* is the end line of plaintiff on the contact vein, and that the plaintiff has no right to follow said contact vein, or portion of Wyoming vein, outside of the side lines of the Ural claim, because the end lines are not parallel and that the vein passes through a side line. That when the defendant obtained the Receiver's receipt of the Land Office, it was equivalent to a patent, which gave a new title to property of defendant, to which the former judgment in previous action does not relate, and hence could not be set up as a bar in this action.

These are the principal points involved in the actions which are before the court, the decision of which will be looked for with interest by mining men, as the points are allied closely to recent decisions.

THE latest events in the great strike remove the matter from the domain of public right or private wrong, to the wider one of rebellion and civil war. It would seem that the ballot is preferable to the bullet, and that it is far better every way to outvote people than to outfight them, particularly when every one who ought, and a good many who oughtn't, have the votes. But, in such a crisis as the present, there is but one course for every man—either train with those who are for law and order, or with those who plot murder and treason. There is no midway ground. Men have been killed in this State and elsewhere—not by "accident," as some publications cowardly assert, but by deliberate assassination—while in discharge of their plain duty, and the echoes of corporate greed or organized opposition are lost in thunder from the dark cloud of anarchy. We are American citizens, and our claim to that proud title must be vindicated by our readiness to acknowledge the supremacy of law.

THE published reports from the South African mines have deterred many Californians from emigrating to that far-off land, rightly concluding that "'tis better to endure the ills we have than fly to others that we know not of." To a man without large capital or great natural ability the South African fields offer little encouragement for success, and to the man with either or both, success is assured by less effort here.

THOUSANDS of visitors still daily throng the site of the late Midwinter Fair. The buildings are being stripped of their contents and but little will be left to see after next week.

Concentrates.

THREE ten-stamp quartz mills are reported being put in at mines at Alleghany, Sierra county.

A LARGE roaster and chlorination plant has been added to the Yarnell mine, Yavapai Co., Arizona.

THE weekly output from the Broken Hill Proprietary mine, New South Wales, is 300,000 ounces of silver.

DURING the mail famine, city papers have sold as high as $1.50 a copy in several isolated communities.

THE Starlight Mining Company has incorporated; capital stock $100,000, of which $27,750 has been subscribed.

THE water in the Yuba river is unusually clear, showing that comparatively little debris from the mines is held in solution.

HUGH GRANT, a well-known miner, was killed by a blast in the Golden King quartz mine on Kanuka creek, Sierra Co., last Saturday.

THE Derbec Mining Company has finished a survey for a ditch to Canyon creek, ten miles above Washington. The cost will be $300,000.

D. BOYLE, owner of the Lone Pine group of gold mines, has sold his placer claims, lying between Skull valley and Walnut Grove, for $75,000.

A GOLD nugget weighing 28¾ ounces and valued at $500 was recently found by E. Cook in the mining claim of Cook & Murphy at Kelsey.

BY a vote of 402,722 Nevada county was awarded the silver cup offered by the San Francisco *Chronicle* for the best mineral exhibit at the Midwinter Fair.

THE Nugget mine and mill at Gila City is to be put on a paying basis. A new boiler will be put in the mill and the machinery given a thorough overhauling.

IN JULY $70,000 mine assessments fall due; of the amount $9000 is asked for three California mines; the remainder for eight in Storey county, Nevada.

A MILL to refine sulphurets will be erected at the Lewis mine, near Mt. Reuben, Or. There are sulphurets to the value of $40,000 piled up at the mine.

FOR the first time in thirty years merchandise is being freighted by team from Sacramento to Grass Valley. By rail it would be $8.50 per ton; by team it is $20 per ton.

THE *Union* says a small crushing of ore from the Rose Hill mine just put through at the Gauthier mill, yielded about $77 per load, saying nothing of sulphurets which are worth $250 per ton.

THE Parrott mines and smelter at Butte, Mont., have closed for lack of fuel and cannot resume until the Union Pacific is open. Some of the Anaconda Company's mines have also closed.

THE Middle Feather River Gold-Mining Company has been incorporated in Oakland. The capital stock is $500,000. The directors are S. A. Stevens, W. S. Steveus, J. R. Scupham, E. S. Irvin, A. M. Rugg and H. Smith.

FIFTY-TWO AND ONE-HALF ounces of amalgam were retorted from the Pennsylvania mine, near Grass Valley, recently. The gold was from a crushing of 46 tons of ore from the mine, giving a yield of about eighteen dollars and a half per ton.

ON June 27th there were nine counties without railroad connection with the rest of the State, viz.: Modoc, Plumas, Lake, Tuolumne, Mariposa, Alpine, Trinity, Humboldt and Del Norte. Since then the number has been greatly increased.

THE Poorman mill at Silver City, Idaho, was burned to the ground on the 4th. The fire broke out at 8 P. M., and there was no means at hand to fight the flames. It was a total loss. There was no insurance. It was a 20-stamp mill, worth $40,000.

A DISCOVERY of rich placer ground is reported on Cariboo creek, 20 miles from Nakusp. Coarse gold was found in abundance, each pan running from 25 cents to $1.25. The gold has apparently not traveled far, as points can be discovered on it with the naked eye.

A CRIPPLE CREEK, COL., dispatch of the 11th says: "The richest ore ever seen here was turned up in one of the mines to-day. The streak varies in width from two to four inches. The free gold is malleable and is in sheets as large and fully as thick as a five-cent piece."

BIRDSEY, KNOTTS & SWINDEN have sold their ledge in Kane's Creek district, southern Oregon, to Chapman Bros. of Oakland for $20,000. They will put a mill on the property. The ledge is three feet wide at a depth of 30 feet, and the ore is free-milling. The old company retains the quartz already mined and also the privilege of sluicing the surface.

ANOTHER "gold excitement" is reported on the Gila river, sixty miles east of Yuma, where it is asserted the old bed of the Colorado has been found in which is located a belt of gold-bearing gravel sixty miles in length by one to two miles wide. Prospecting shafts are now being sunk to reach the pay streak, which is believed to be eighty feet below the surface.

THE Escondido mine has temporarily suspended operations. It is reported that work will be resumed under a new management, under which the mine will be exploited in a systematic manner. The Escondido mine is one of the oldest in the State, and, according to tradition, was worked before Fremont came to California. It is situated in the center of a wheat field, two miles from the town of Escondido.

THE State Anti-Debris Association has made complaint against the North Bloomfield Mining Co., alleging that it is discharging tailings and debris into the South Yuba contrary to law. Similar complaint has also been made by that association against C. and J. O'Connor of North Bloomfield. The United States Debris Commission has sent official notice to the parties complained of, calling attention to the requirements of the Act of March 1, 1893, and requiring them to cease mining by the hydraulic process.

W. T. PHIPPS, manager of the State Anti-Debris Association, took samples of the waters of the Yuba river at the D-street bridge recently and he is very much pleased with the condition thereof, there being comparatively little debris held in solution, says the Marysville *Democrat*. The stream is clearer than it has been for several years. N. E. Boyd, chief of the watchmen in the employ of the association, came down from the headwaters of the Yuba river lately, and he reports that no debris of any consequence is being washed into the stream, which is the cause of the present condition of the water. The only mines now in operation are the Excelsior at Smartsville and the Bloomfield, which are depositing very little, if any, detritus in the stream.

THE chicken with gold in its gizzard, annually reported from Grant's Pass, is this year outdone by Banker Hellman of Los Angeles, who has eucalyptus trees at Cucamonga, Cal., in the bark thereof "tiny specks of gold" having been discovered last week. Hellman's manager's theory is that "capillary attraction caused the sap to carry the gold up from the earth." The dispatch says: "The matter has been kept quiet and has caused no excitement." That's good. Excitement is always fatal to such processes of gold deposition.

THE once-famous Catholic mine in the Santa Ynez mountains, in Santa Barbara county, is reported re-discovered. This mine was operated by the Spanish padres, it was exceedingly rich in free ore, and has been lost since 1850. The location of the mine has been kept a secret until Henry Stewart claims to have recently stumbled upon it. He says that it contains free gold in the rock, which is easy to work. As soon as claims have been taken up it will be worked. Several men have gone to the locality to stake claims. Specimens of free gold are large and remarkable for the purity of the ore.

ONE singular result of the strike has been the protracted closing down of the U. S. Mint in this city. On June 16th, Supt. Daggett shut off the receipt of crude bullion, and on the 23d stopped receiving refined bullion, not because of any labor trouble, but in usual accordance with the annual custom of suspending operations till the arrival of the government representatives who were on the way. The strike tied them up at Ogden, and till they arrive and make the regular annual examination and settlements the big government coin factory at 5th and Mission is idle. Even a government mint doesn't make money these times.

THE following is related as a fact by the Australian *Mining Standard* and goes to show that the gold fever has got a pretty tight hold of South Australian people. It occurred in a north-eastern town, and the occasion was a prayer meeting. One brother was holding forth, and he spoke thusly: "Lord bless this meeting. Bless all the brethren who are present. Bless those who are absent. Bless all the young people. Bless this town, and——" Here one of the worshipers interjected—"What about the cyanide process?" "Aye," went on the prayerful person, who probably had an interest in some gold claims in the vicinity, "Lord bless the cyanide process." To this there came as a response a unanimous "Amen," and the speaker got up and brushed the dust from off his knees.

THE one hundredth man with a sure process for separating the gold from the black sand along the coast has appeared in Isaac Banta of Albany, Oregon, who claims his method is a success. A long sluice is used, with a hopper and sieve, to keep out the larger debris in the sand. The chemical preparation is then placed in the bottom of the sluice-box, which collects or precipitates the fine gold in the bottom of the box. It is claimed that men who used to get 75 cents to $1 a day by the old processes are now taking out as high as $5, and even, under favorable conditions, $18 per day. Thirty-five men are reported at work on South beach between Yaquina and Alsea, and most of the claims are taken for 14 miles down the beach. The owners have gone to Port Orford to put some machines to work there, and several miners have gone up the coast as far as Tillamook.

Clipped and Condensed.

THE cholera has reached Belgium and England.

THE United States flag has forty-five stars. Utah is a State.

WELLS, FARGO & Co. say this strike is costing them $10,000 a day.

IT is figured that the maintenance of the State militia at Sacramento costs over $4000 a day.

NEARLY all the main buildings of the Chicago World's Fair have been totally destroyed by fire.

DURING the week the English yacht Britannia defeated the American yacht Vigilant in three races in British waters.

FOR a four-hours' argument in a law case at Indianapolis, Ind., last Wednesday, ex-President Harrison received a $25,000 fee.

A SECOND cloudburst swept away in the town of Conconnully, in the Okanogan mining district, on the 5th, all that was left standing after the cloudburst of last May.

THE chemical works of Williams & Clarke at Carteret, N. J., said to be the largest in the world, were almost destroyed by fire last Wednesday. The loss approximates $500,000.

BY a ruling of the House of Representatives, the claims of five San Francisco banks, aggregating $825,633, have been refused. The banks lost that amount by the fraudulent issue of naval supply certificates by inspector Spalding.

IT is reported at Guaymas that the Achison, Topeka and Santa Fe Company has leased its Sonora line between Benson and Guaymas, on the Gulf of California, to George Douglas of Mazatlan, a capitalist who owns a line of steamers on the gulf.

THE cannery of the Astoria Packing Company, M. J. Kinney principal owner, the largest salmon cannery in the world, was totally destroyed by fire last Saturday. The loss is estimated at $70,000, including nearly 10,000 cases of salmon ready for shipment; insurance, $40,000.

THE tide of emigration is setting back to Europe and away from the United States. This has never happened before or since the first statistics of emigration and immigration were made in 1820. In the six months ending last Saturday, the arrivals of immigrants have been 66 per cent of the departures.

CONGRESSMAN MCGANN, chairman of the Committee on Labor in the House, has a bill framed for avoiding strikes, which he will present to President Debs, A. R. U., President Gompers of the Federation of Labor, and the heads of large railway and other corporations. The plan contemplates a contract between employes and employers, by which each will agree to submit their differences to arbitration.

SERIOUS trouble has been reported from the Cœur d'Alene mines during the week, the towns of Wallace and Wardner and vicinity being terrorized by rioting miners whose policy seems to be to take advantage of the railway and labor troubles to make as much additional confusion as possible. Business of all kinds was paralyzed, all the mines shut down, a sheriff's posse organized and a call made for troops. On Saturday morning an attempt was made to blow up the powerhouse and electric-light plant of the Bunker Hill and Sullivan mine, sticks of dynamite having been exploded under the building, partially wrecking it. On the hills above the powerhouse were massed the rioters, rolling boulders, slag and logs down on the mines and buildings. Governor McConnell asked for troops, which were furnished from Vancouver. The Governor offered $1000 reward for the conviction of the murderers of the blacksmith, John Kneebone, at Gem on the 3rd, a crime that was witnessed by 150 people. The row is the aftermath of the Canyon Creek slaughter, two years ago. That event was solemnly commemorated on Wednesday by a parade of 730 men at Wallace, Idaho, and 790 at Spokane, Washington. Flowers were strewn on the graves of the rioters killed July 11, 1892, and speeches made, the real object of the demonstration being a display of numerical strength.

THE progress and status of the great strike since our last issue is thus summarized: In Chicago, the storm center, a maddened mob on Saturday destroyed hundreds of cars with their contents; six persons were killed and several wounded; firemen were beaten, hose cut, tracks torn up, the rioters being dispersed by Illinois State troops. Debs issued a proclamation of peace. In this State the California National Guard were in camp at the State Capitol in Sacramento, the A. R. U. was in possession of the depots at Sacramento, Oakland and Los Angeles, and no trains moved. The strike had spread as far east as Buffalo, N. Y. On Saturday night President Cleveland issued a proclamation virtually declaring martial law in Chicago and the State of Illinois. At Hammond, Indiana, just across the Illinois State line, there was deadly conflict, and at several other points armed disturbance took place. On Monday all local efforts at arbitration failed, both parties to the matter declining to entertain any proposition for mutual consideration. By Monday night the Santa Fe and Union Pacific had succeeded in moving trains eastward, the Northern Pacific and Great Northern had a desultory service, the Southern and Central Pacific were still tied up, the only property of theirs moving in the State being the boats on the bay and river. U. S. Dist. Att'y Denis, at Los Angeles, notified the S. P. officials that they must run mail trains irrespective of any complications regarding Pullman cars. On Tuesday morning President Cleveland issued another proclamation covering the entire western half of the continent, commanding all persons engaged in or connected with "unlawful obstructions, combinations and assemblages, to disperse and retire peaceably to their respective abodes on or before 4 o'clock of the afternoon of the 10th day of July." On Tuesday trains began to move at Chicago, and regular army troops repelled nearly all riotous tendency. Throughout Tuesday further efforts were made by various commercial organizations to secure arbitration, but unsuccessfully. The presidents of the various great labor organizations threatened to order a general walkout of every labor union in the country thus controlled. The United States troops in and around San Francisco were set in motion under command of Gen. Ruger, the *Monterey* and *Charleston* put under orders at Mare Island, and a detachment of the regular army started for Sacramento on the Alameda. At Sprague, Wash., there was a riot on the Northern Pacific, resulting in the destruction of some property and the demoralization of a part of the Washington State Militia. Tuesday was a period of general discussion all over the country as to the likelihood of a general strike, as the K. of L. and the Federated Trades had joined the A. R. U. in its determination to see the end on the lines originally laid down. On Wednesday came the climax. Up to that time there had been since June 8th a daily loss to the general people of California of a million dollars, to the S. P. Co. $200,000, and to the railway's employes $25,000. The loss to the nation would, doubtless, aggregate $10,000,000 daily. Prest. Debs of the A. R. U. and three associates had been arrested at Chicago, and released on bail, General Master Workman Sovereign of the K. of L. had called out that organization, comprising, it was claimed, directly and indirectly, 1,000,000 men, and President Gompers of the Federated Trades had expressed his sympathy with the idea, the regular army was in possession at Chicago and elsewhere, trains arriving and departing regularly wherever they appeared, it being generally realized that resistance to the Federal troops meant treason to the Government. On Wednesday throughout the nation the general order of Sovereign fell flat, less than five per cent of the men going out, mostly in Chicago. The K. of L. leaders claim that when the local unions act the order will be effective, and that to-day there will be a general walkout of labor unions in every State. East of the rocky mountains trains were moving on all roads with partial regularity. There was still trouble at Hammond, Indiana, and in Chicago dynamite was exploded in the Illinois Central car shops, and two attempts reported on the life of Vice Prest. Wickes of the Pullman Car Co. The climax of lawlessness was reached in this State. The U. S. regular troops reached Sacramento at daylight, took possession of the railway depot, a train was made up for this city and started at noon. When three miles out it was derailed and sent crashing over a trestle into fifteen feet of water. The engineer and four soldiers were killed, and several wounded. The uninjured cars were brought back to Sacramento. The crime was charged to the strikers, and four men found in the vicinity of the wreck were arrested. The penalty for train-wrecking under the State statutes is death. The A. R. U. leaders disclaimed any connection with the crime. The relation between cause and effect is very close. Shots were exchanged between sharpshooters on both sides in Sacramento. The general expectation was that a deadly collision there was inevitable. In Philadelphia the K. of L. demand the impeachment of Attorney-General Olney, and in Cleveland, O., they ask that President Cleveland be impeached. In Ft. Wayne, Ind., and elsewhere, the newspapers have been warned by the A. R. U. that adverse comment on its actions will result in their being "boycotted." Arbitration is still advocated by cool-headed men on both sides. At this writing it appears that the strike has culminated; that public opinion is for the supremacy of the law as its exists, with a view to its future alteration, and that a guerilla warfare on railway property will continue for a week. Up to yesterday morning there was no strike of any California labor organization in sympathy with the A. R. U., the general feeling among employers and employes being that arbitration could and should settle all present differences. Outside this State the strike is considered as being over.

Resume of the Mineral Industry of California for 1893.

Compiled by the Statistician of the State Mining Bureau, under the direction of J. J. Crawford, State Mineralogist.

California continues to he the leading gold-produciug section of the United States, a position it has held since the discovery of the precious metal within its borders. In comhined gold and silver product, California is only exceeded hy Colorado and Montana, they beiug the largest silver producers, but in gold this State is still first, leading all others by six or seven millious of dollars annually.

It is highly prohable, moreover, that the gold product of the State will he materially increased during the next few years, owing to the partial rehahilitatiou of the loug dormant hydraulic mining industry, and the renewed interest in gold mining generally, due to the decline in silver and lead mining. As this State has the largest available area of auriferous country, it is here that those who have ahandoned silver mining will naturally come in search of gold properties.

The gold product of California for this year is betweeu $12,000,000 and $13,000,000. In 1892 it was $12,571,900. In 1893 the statistics of John J. Valentine, President of Wells, Fargo & Co., gave a precious metal outpnt of $13,096,948. Of this $257,-005 was silver and $1,667,907 in "ores and base bullion hy freight." As our lead product is only 300 or 400 tons a year, the other ores were mainly gold, so that the gold ontpnt for 1893 may he fairly set down, from the foregoing figures, as above $12,-500,000.

During the very thorough investigation made for the recent censns, the gold and silver product of the State was found to he for that year $13,960,529. The statistics were persoually collected hy agents, who visited all the mines throughout the State. This sum was above the usual estimates, and showed that the State was really produciug every year more than it was credited with. The investigation also showed that the precious metal mines of California returned in bullion $1 for each $5.12 invested. The iuvested capital is $71,934,968. In these figures the great hydraulic mines draining into the Sacramento and Sau Joaquin rivers were not considered, as none of these were in operatiou during the censns year. In the section referred to, an investment of $100,000,000 has been made in this class of mines, but this has been an unproductive industry for mauy years, for reasons stated elsewhere in this chapter.

Gold and silver are found and mined to a greater or less extent in forty of the counties of this State, and largely in more than half that number. Although the silver product of the State has been sometimes as high as two and a half millions, it is now only a few hundred thousands annually. The principal silver mines are iu the sothern part of the State, while the principal gold mines are in the northern and central part. It is in gold that California has earned her repntation as a mining region, as it was that which originally caused the settlement of the State. The miuers who came here iu the early days ueeded ouly very simple appliances to obtain the gold, which the conceutrating forces of nature had gathered in the gulches, ravines, canyons, creeks, river bars and beds, ready to the hand of any who chose to seek for it. The pick, pan, shovel, rocker, long tom and sluice were all the implements which were necessary, for this was the era of "placer" or surface mining, when fortunes were gaiued iu a day. Only rich "diggiugs" would pay to any extent with these appliances, which to-day are mainly used hy the Chinese, in diggings considered by white men as being too poor to work. The sluices only, and these much enlarged, are still nsed hy the whites in their surface work, and the pan is used only for prospecting and cleaning np. None of these things have capacity enough for the preseut system of gold getting in California. For many years, however, our enormous yield of gold was ohtained with these appliances and from these sources. In the year 1855 the snm of $81,294,700 was taken out. Before that it was supposed that gold in quantity was only to be found in ravines, gulches, bars, etc., and as these offered the best rewards they were first sought for. Nothing but labor was reqnired to obtain the gold, aud there was pleuty of nntried territory for all who came. The early miners collected the gold in quantities that now seem almost marvelous. Gradually the area of this surface mining narrowed down, and atteution had to be turned to other sources for the gold which all were iu search of. After a time it was discovered that the great red hills contained plenty of gold in their gravels, though the dirt was much poorer thau the shallow placers. This necessitated the handliug of a great amouut of material, and then it was that hydraulic and drift mining came iuto vogue; then, too, they began to inquire into the sources of the gold, and men commenced to hunt for and open quartz ledges. The collection of gold from these sources is a much more expensive operation than taking it from the shallow aud surface placers, and very different systems have to he adopted.

With the exhaustion of the shallow placers and surface washings came a gradual change of methods. The conditions which prevail in the mining regions of the State to-day are eutirely different from those of the early days of gold mining. The nomadic habits of the miner have disappeared; he is no longer a free lance, roving from camp to camp and living in a tent or cabin while working his claim. Around all the larger miues are permanent settlements, where the miners live with their families, content to work for day's wages and a sure income. The larger mining towns of the State, where there are a number of mines, have lost entirely the old features of mining camp life. The people have settled down to mining as a permanent business, and conduct it like any other industry.

Although the principal large producing gold mines of the State are uow owned by private individuals or corporations, many small claims and "prospects" belong to individual working miners, who do more or less prospecting for themselves, as occasion offers. As a general thiug, however, claims of this latter class are held for sale, the men themselves not having sufficient capital to put them on a producing basis.

California, as the pioneer precious metal producing State of the Pacific coast, and the one which has made the greatest aggregate yield, has very uaturally long since passed its "boom" period, and its mining affairs are conducted on a business rather than a speculative basis. High-priced officials and supernumeraries have been doue away with, and only efficient men employed in the different departments. Railroads and better wagon roads, cheaper supplies, more knowledge and general lessening of cost in operatious, all coutribute to make quartz mining more profitable thau formerly. More care is exercised in conducting operations, and there is a more thorough understanding of the methods of saving gold from its ores. Again, the appliances of mining and milling are more perfect, and there is not so much experimenting as formerly, and mines that would have run a company in debt twenty years ago now yield a profit to their owners. As a result, many old claims, abandoned during a former era, are beiug reopened under the changed conditions of working.

The couuties of Nevada, Trinity, Calaveras, Amador, Placer, Tuolumne and Siskiyou each produce over $1,000,000 a year in gold. Shasta aud Sierra counties each produce over half a million. Butte, El Dorado, Mono, San Diego and Plumas each produce over a quarter of a million. Others which produce over $100,000 per annum are Madera, Kern, Los Angeles and Sacramento. Those which produce less than $100,000 aud over $50,000 are Humboldt and Mariposa. That producing less than $50,000 and over $25,000 is Yuba. Those producing less than $25,000 and more than $10,000 in gold are Tulare, Inyo, Fresno, Lassen and Stanislaus. The counties producing less than $10,000 annually are Del Norte, Merced, Orange, Santa Barbara and San Luis Obispo. The main source of silver supply in the State is iu San Bernardino county, though several of the other counties make a small product annually.

In most of these counties there are still many undeveloped mines awaiting the aid of capital. There is, of course, more or less prospecting carried on in all of them by the residents, and occasionally new claims are found and opened. There is room for prospectors in even the oldest mining counties, but much of the ground has been gone over time and time again. Those who are unfamiliar with the business of quartz mining, but desirous of making investments, will do best when they take the advice of experienced mining engineers before concluding a purchase. The business beiug now au established one, there is nothing in it to tempt a merely speculative immigration, and those who come to this State to enter mining without experience and without capital will he apt to be disappointed. There is plenty of room for the iuvestment of capital, however, and it is not necessary to have a large amount to obtain possession of quartz mines unless they are fully developed and proven to he paying mines. In that case, as in any other business, the mines have a certain market value well known to the owuers and caunot he hought unless the price he paid.

The speculative feature is indeed less prominent in this business than many suppose. Because San Francisco has heeu the seat of extensive mining stock speculation, many imagine that California mines are those dealt in. This is not, however, the case. Very few California mines are listed upon the stock and exchange hoards of San Francisco, The speculation has been mainly in Nevada silver mining stocks, aud California mines have heeu worked for what there is in them, and not for what might be made out of speculations in the stock of the companies in the stock market.

It is to be remembered that in order to ohtaiu gold from quartz mines the quartz must be crushed and the gold amalgamated. The larger mines have their own mills for this purpose, and the smaller ones get ores worked in the custom mills at a fixed rate per ton. But in large operations a mill is required, and this is one of the reasons why capital is necessary in this class of work. Some of the qnartz mines of this State which have been worked for twenty, thirty or more years are still producing. There are hundreds and hundreds of nnproductive and undeveloped claims, or "prospects," all over the State, and which are for sale, because the owners have not the means to open them. It is in this class of mines that there is the most room for investmeut. It is impossible to tell where to look for such claims, but they may be found in every mining county of California.

The auriferous gravels of California still produce a great deal of gold, especially in such counties as Siskiyou, Trinity, Nevada, Placer, Sierra aud Plumas. In Siskiyon and Trinity, where the watershed is into the Klamath river, a non-navigable stream, they may mine by the hydraulic system without danger of interference. In those countics, the streams of which drain into the Sacramento or the San Joaquin river and their tributaries, hydraulic mining may not be carried on except under certain restrictions.

In getting the gold from the deep gravels by the hydraulic method, immense streams of water are turned against the gravel banks through a nozzle aud under great pressure. The stones, gravel, earth, etc., then pass through "sluices," and the gold-saving appliances retain the gold, while the debris passes down into the streams. Immense quantities of low-grade gravel may he made profitable hy this method, as large quantities of material may he handled at a small expense. However, the great mass of dislodged earth, etc., called "debris," or tailings, passing ou down into the streams, shoaled them and injured the farming lands aloug the banks. This in time gave rise to a serious controversy between the miners of the mountains and the farmers of the valley, aud long and costly litigation ensued. It finally resulted in injunctions from the United States courts against the hydraulic miuers, and the mines were closed all through that section of the State drained by the Sacramento aud San Joaquin rivers and their tributaries. For eight or ten years these mines were prohibited from hydraulicking, and in many cases the deposits were then worked by the "drifting" process, which consists of running tunnels and taking out the richer lower strata of the ancient river bed deposits. This is then washed on floors, or, if hard, crushed in "cement mills," which are much the same as the ordinary quartz mills. This is much more costly than hydraulic mining, as only part of the auriferous ground can be worked. In hydraulic mining the whole mass is washed away aud the gold obtained. In drift mining only the bottom part is worked and the rest left. In many places the channels are so covered by lava cappiug that they cannot be hydraulicked, and theu drift mining only is carried on.

In January, 1891, Governor H. H. Markham, in his inaugural address, called the atteution of the Legislature and the people of the State to the practically abandoned sources of gold production iu the hydraulic mines, and to their importance. He suggested the possibility of some amicable adjustmeut of the differences between the valley and the mining counties, and recommended that the subject of rehabilitation of these mines should be thoroughly agitated, Congress memorialized, and our Senators and Congressmeu urged to take all necessary steps to briug the matter before Congress at the earliest possible moment. This official declaration of the Governor of the State gave the hydraulic miners the first hope of relief they had experienced for years. An effort was made among them toward coucerted action, and a Miners' Conventiou called at San Francisco, which was attended by delegates from all the counties. The tone of the proceedings was conservative, the miners asking only that Congress should devise some means hy which they could work their properties without inflicting any of the injuries complained of in the past. In accordance with Governor Markham's suggestion, the Legislature memorialized Congress on the snhject, and the State Miners' Association, formed during the convention, did the same.

A commission of Government engineers, which had previously made an examination and investigation of the region affected hy the hydraulic mining debris, reported to Congress that, under certain conditions, impounding dams for the debris could be constructed, which would prevent most of the damage resulting from this system of miuiug.

Takiug this report as a hasis, the miners of the State urged upou Congress some action which would permit the dams to be built and the miues again worked.

The Caminetti Act was then iutrodnced, and finally, after mauy months of delay and discussion, became a law. Under this, it is now lawful to operate mines hy the hydraulic method in the area drained hy the Sacramento and San Joaquin rivers and their tributaries, providing a license is issued by the California Debris Commissiou, which was created hy this law, and consists of three engineers of the United States Army. In all cases the miners must impound the debris from their mines and prevent it in any way getting into the streams or injuring the lands of other parties. In order uow to obtain a license to mine hy this method and operate the claim, the miners must preseut a petitiou to the Commission, accompanied hy maps of the ground and drawiugs of the proposed impounding works. A hearing is held before the Commission, at which any one objecting to the issnance of the license may appear and show cause. The mining property is personally examiued by the engineers of the Commission, and if the plans are approved and the impounding works properly constructed, a license to mine is issued. At any time, however, if the restraining works are

found to be inadequate to the purpose, the Commission may withdraw the license and close down the mine. In this way the rights of all parties are protected.

Under this new law a few mines in the region referred to, which were previously closed, have resumed operations. A number more have made application for license to mine, and are constructing restraining works, and others are preparing to do so. The effect of this resumption, on the gold product, will not be felt until during the year 1894, as at the end of 1893 very few of the mines had completed their preparations for again working.

Thus far it has been mainly the larger properties, owned by men of means, for which licenses have been asked. In some cases the hydraulic mines are so situated that it is impossible to build the impounding works required. In most of the smaller claims the owners are unable to construct the impounding dams, for lack of means. It is not probable, therefore, that under existing conditions the hydraulic mining industry will attain its former proportions, but it is also true that some hundreds of claims, when properly equipped with restraining works, may again resume operations. In this class of mining, capital is absolutely essential for large operations. Reservoirs, ditches, flumes, etc., must be built, and pipe lines laid, for water supply is a very important adjunct, without which the mine itself is practically useless. It should be borne in mind that this state of affairs relates entirely to the drainage area of the Sacramento and the San Joaquin rivers. In the northern part of the State, in Siskiyou and Trinity counties, where there are extensive gravel deposits, hydraulic mining may be carried on without reference to the California Debris Commission, as the mines eventually dump their debris into the Klamath river, a non-navigable stream.

There is still more or less placer and gravel mining carried on in many of the counties, but it is mainly done by Chinese, who are content with less profit than the whites. No one need count on going into the interior to prosecute this class of mining, for much of the land is already in the possession of others, who, if they do not use it, lease it to Chinese.

On the whole, it may be said that the gold mining industry of California is just now in a prosperous condition, with a probability of an increase of product. Some of the more prominent mines have been increasing their product materially in the past year, and many old claims have been reopened and new ones put in process of development. More attention has been paid to the industry than has been the case in 20 years past, and considerable money is being invested. Not only are Californians themselves showing more interest in gold properties, but men from abroad, and from other mining States and the East, are turning their attention to the California gold fields. There has been more inquiry for gold-producing properties in the past six months than has been the case for many years. In some of the larger gold mining centers many claims have changed hands of late and owners of "prospects" and half-developed claims are much encouraged.

It must not, however, be supposed that gold and silver constitute the only mineral wealth of California, since, while the annual precious metal product is from $12,000,000 to $13,000,000, the total mineral product of the State is nearly $20,000,000 a year. In the census year it was $19,699,354, placing California *seventh in total mineral output* on the list of States, it being exceeded only by Pennsylvania, Michigan, Colorado, Montana, Ohio and New York, whose iron, coal, copper, lead and silver gave them a high standing. In addition to gold and silver, California is a large producer of other mineral substances, some of which are not mined in any other part of the United States.

Quicksilver.—Nowhere else on this continent is quicksilver mined, and our annual product is worth from $1,000,000 to $1,250,000. It comes from the counties of Santa Clara, Lake, Colusa and San Benito.

Borax.—All the borax produced in the United States comes from California and Nevada, but most of it comes from this State. The total product is worth from $800,000 to $1,000,000 a year. In 1893, of the 8,699,000 pounds produced from the two States, 7,499,000 pounds came from California mines. In 1892, of the 12,538,196 pounds produced, 11,050,495 came from this State.

Oils.—Our mineral oils are very valuable, and we stand number six among the States in petroleum product. The value of this in California is from $500,000 to $1,000,000 per annum, and it is mainly from Southern California.

Asphalt.—This State produces more rock asphalt than any other region of the United States. In fact, it is only mined elsewhere in Utah and Kentucky. Our product here comes mainly from Santa Barbara county, and amounts to about 9000 tons a year, and worth at the mines $160,000. The mines in Kern county will shortly be productive also.

Bituminous Rock.—The increase in the use of the bituminous rock has been very great of late years, and there are large deposits in Santa Cruz, San Luis Obispo and Santa Barbara counties. Of this the product is from 25,000 to 40,000 tons a year, and worth from $2.50 to $3.50 per ton at the mines, and $6 per ton in San Francisco.

Coal.—The coal product is quite small as compared to other States, and ranges in value from $200,000 to $300,000 a year. The output has been decreasing since 1889, when it was 121,820 tons, worth at the mines $288,252, or an average of $2.36 per ton. In 1890 the product was 110,711 tons, worth $283,019, or an average of $2.56 per ton. In 1891 the product was 93,301 tons, worth $204,902, or $2.20 per ton. In 1892 the product was 85,178 tons, worth $209,711, or $2.46 per ton. These are the statistics of the United States Geological Survey. Those of last year are not available at this writing. The figures for 1892 show the distribution of sources to have been as follows: Alameda county, 25,618 tons; Contra Costa, 41,440 tons; Fresno, 10,730 tons; Monterey, 560 tons; San Bernardino, 6830 tons.

Magnesite.—No other State mines magnesite, of which our product is from $10,000 to $15,000 a year, mainly from Napa county. It is used in paper manufacture, and for furnace linings. This substance is found in many counties of the State.

Manganese.—In 1888 the State made a product of 1500 tons of manganese, worth $9 per ton, but since then the product has been rather small. The product now averages from 150 to 300 tons a year, and comes mostly from Alameda county, and is worth about $12 per ton in San Francisco. Most of it is used in making chlorine gas, at chlorination works.

Tin.—Though none is being mined here at present, this is the only State that has made any commercial product. The Temescal mine, near South Riverside, produced 162,000 pounds during 1892, but has not since made any yield.

Chrome.—The only chrome produced in the United States is in California, and it is worth from $20,000 to $40,000 a year. It is mined in Alameda, San Luis Obispo, Shasta, Tehama and Glenn counties, but the bulk of the recent product is from the latter county.

Copper.—We produce from 1,000,000 to 3,000,000 pounds of copper annually from the few mines being worked in Calaveras and Nevada counties.

Antimony.—From 1883 to 1888, inclusive, all the antimony mined in the United States came from California; but since that time Nevada mines have yielded more than those in this State. The smelting works in San Francisco make a product worth from $30,000 to $40,000 a year, but California only produced ores worth $2500 in 1893. The mines are in San Benito and Kern counties.

Gypsum.—The deposits in Santa Barbara county were worked for a number of years, and the product when calcined at the works in San Francisco was worth $30,000 a year, the annual product varying little. Most of the output was calcined into plaster of Paris, only ten per cent being sold as land plaster. For the past two years work has ceased on the deposit, the material required for the works here being imported more cheaply from Mexico. Some little work has been done on deposis in Fresno county, but there is little commercial product.

Asbestos.—California is one of the few States in the Union making any commercial output of asbestos, but our product is quite small, being only worth from $2000 to $4000 a year. Up to 1891 no other State made any product of the mineral, but in that year, while this State made a yield of 66 tons, valued at $3960, there was 64 tons from Oregon and 10 tons from Wyoming. In 1892 this State produced 30 tons; in 1893 about 50 tons. It was from Riverside county. The mineral has quite extended occurrence in the various counties of California; but owing to the limited demand, cost of mining and transportation, few of the deposits are utilized.

Building Stone.—We are fast increasing our product in this line. Even now the granite output (which is mostly from Placer county) is worth $1,300,000 a year; sandstone, some $200,000; and marble from $500,000 to $600,000 a year. Our slate all comes from El Dorado county, and is worth about $20,000 per annum, with a prospect of an increase soon.

Platinum.—No platinum is obtained from any other State in the Union, and even the product in California is quite small, amounting in value only from $1000 to $2500 per annum. It is obtained as a by-product from surface gold mining, but very few of the miners make any effort to save it.

Salt.—The salt made in Alameda and San Diego counties is worth from $100,000 to $150,000 a year.

Lead.—The product of lead is small, but it amounts to from 350 to 500 tons per annum, all from Inyo county.

Ocher.—Yellow ocher is mined here, and amounts to from $4000 to $6000 a year; and other mineral paints are also manufactured from local products.

Mineral Waters.—The mineral waters utilized in the State are valued at upward of $25,000 a year.

Natural Gas.—The amount of gas produced is worth from $30,000 to $40,000 a year. Recently a new industry has been inaugurated, namely, the utilization and liquefying of the immense amount of carbonic acid gas produced in the Almaden quicksilver mine.

Clay.—Large quantities of clay, which are used for the manufacture of pottery, fire-brick, sewer pipe, etc., are mined here, the total value ranging into the hundreds of thousands of dollars annually.

Miscellaneous.—The sale of gold quartz for jewelry amounts to from $5000 to $10,000 a year; fancy quartz specimens and miscellaneous minerals for ornaments, about $5000; grindstones, from $2000 to $3000; infusorial earth in the State comes to about $8000 a year.

In nearly all these branches of mineral industry there is room for increase of product as more capital is invested in various mines. In many instances there are known deposits which are at present unworked, owing to lack of proper transportation facilities or cost of shipping to distant market.

The Ivanhoe Tunnel.

The Ivanhoe tunnel, the third longest in America, is cut straight through the backbone of the Rocky Mountains from Busk, a small hamlet fifteen miles west of Leadville, Colo., to Ivanhoe, another little village on the western side of the main range. The tunnel was designed to save the Colorado Midland Railway a steep climb to the summit of Hagerman Pass, and over seven miles wasted in the curves necessary to enable the engines to pull up the heavy grades. The tunnel is 9400 feet long, and is only surpassed in this country by the famous Hoosac tunnel and the Boulder tunnel, in Montana, the latter of which is only 300 feet longer than the Ivanhoe. Where the Ivanhoe enters the mountain at Busk, the altitude is 10,800 feet. This is a much greater altitude than that of St. Gothard, which at Goeschenen enters the ground at a height of 3640 feet above the sea level, and emerges at Airolo, on the Italian side, at a height of 3756 feet. The road over the St. Gothard Pass is twenty-two miles, and the tunnel with its length of 9¼ miles, thus saves 12¾ miles. The Ivanhoe saves much more in proportion, lessening the distance between Busk and Ivanhoe by over seven miles in its length of less than two miles.

The contract for the Ivanhoe, which was let to H F. Keefe, calls for the tunnel to be twenty-one feet high and fifteen feet wide in the clear, and to admit of timbers, ground was broken to the extent of twenty-two feet nine inches by eighteen feet six inches. To accomplish this task, every twenty-four hours 200 pounds of giant powder and 800 feet of fuse were used. For the first 1500 feet that were driven a good deal of trouble was encountered from water and loose rock, in many places the rock not being in place. This, at a depth of 500 to 750 feet, caused a great deal of speculation among mineralogists as to the causes which led to this disturbance. It was generally conceded that the acid in the water had cut many and diverse channels in the soft talc and granite, so separating them from the rock in place that when an opening was made from below, a chute was formed, allowing the whole mass to fall into the tunnel. For weeks at a time Mr. Keefe was kept busy removing the wreckage and catching up the cave, and was retarded in the work by the immense flow of water that usually drained out of one of the "soft spots." The flow of water amounted to one hundred gallons per minute. Wherever the ground is soft it has been substantially timbered with red spruce, squaring 12x12. The ground that is in place is not elely ostimbered. In the work of construction the tunnel was lit by electricity, with an arc light every eighty feet, and several heavy air compressors supplied fresh ozone to the workmen at the heading. Eight air drills were kept steadily going at each approach, and the amount driven per day averaged eight feet. From the center of the tunnel to the surface is a distance of 1200 feet.

The present grade to Hagerman is three per cent, but the grade in the tunnel will only be 1.41 to every hundred feet. This stupendous undertaking was begun in August, 1890. When it is being operated by the Midland, large doors will be put up at the approaches to keep out the snow, and the tunnel for several hundred feet from each end will be heated by steam. Watchmen will be placed at the different ends to open and shut the doors before and after trains entering and leaving. Engines will be coaled up a few miles before entering the tunnel, so that the run through can be made without coaling.

A TRIUMPH IN ENGINEERING is reported from the mountains of Peru, where a twin-screw steamer of 540 tons, 170 feet long and 30 feet wide, has been successfully launched on Lake Titicaca, the highest navigable waters in the world, more than 13,000 feet above the sea. This steamer, which belongs to the Peruvian Government, is to be used for freight and passenger traffic and was built on the Clyde, then taken apart in more than 1000 pieces and shipped to Mollendo by sea. It was then carried to Puno by railway and transported over the mountain on the backs of llamas and mules and put together by a Scotch engineer.

THE composition of English brass is about seventy parts of copper and thirty of zinc. "Prince Rupert's metal" contains 75 to 80 per cent of copper, and on account of its golden color is employed to some extent in jewelry. The kind of brass called "tombac" contains still more copper; nearly 85 parts in a hundred. It is the alloy used for the manufacture of what is called "Dutch metal," an imitation of gold leaf; it can be rolled into sheets, and these can be beaten out till they have only the fifty-third thousandth of an inch in thickness.

Gold-Milling at the North Star Mine, Grass Valley, Cal.

Read at the Virginia Beach Meeting of the American Institute of Mining Engineers, by Emile Rector Abadie, Grass Valley, Cal.

The picturesque little mining town of Grass Valley, nestled in the foothills of the Sierra Nevada mountains, at an altitude of 2500 feet, has been for forty-three years the scene of uninterrupted activity and prosperity, as the center of a mining district which was intimately associated with the pioneer days of California, and the discovery of gold by James W. Marshall, in El Dorado county, in January, 1848.

Although placer mining was inaugurated in Nevada county as early as 1848, the first quartz ledge was not located until the summer of 1850. Discoveries on Gold Hill and Massachusetts Hill increased the excitement in quartz mining, and hastened the erection (during the same year) of the first mill operated in the State.

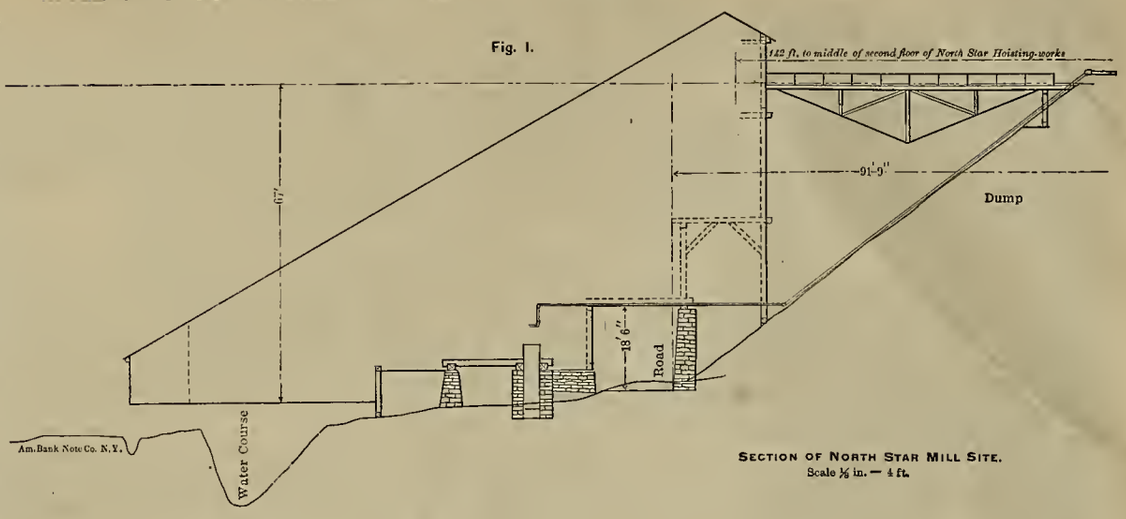
At the close of 1864 the district had produced $23,000,000 in gold, and all the well-known properties of to-day had been discovered and worked. The Eureka-Idaho, the North Star and the Empire mines were in active operation; and to-day we still find them equipped with large crushing plants, operating 80 per cent of all the stamps in the immediate Grass Valley district. Of the mines just named, the North Star possesses the most recently constructed mill, a description of which, the writer believes, may prove of interest to members of the institute engaged in the milling of gold ores.

During the year 1886 operations at the North Star mine (the property of the North Star Mining Coupany) had reached such a stage of development that the necessity of a crushing plant at the mine became imperative, and early in October the erection of a 30-stamp mill was in progress. The building designed to contain forty stamps was speedily erected, and within sixty days the large structure was under cover. The upper cut on page 17 represents the appearance of the mill forty days after work was commenced.

Late in February, 1887, the mill was in readiness, and, upon the completion of the water-power system, then being introduced at both mine and mill, the crushing of ore was commenced March 15, 1887.

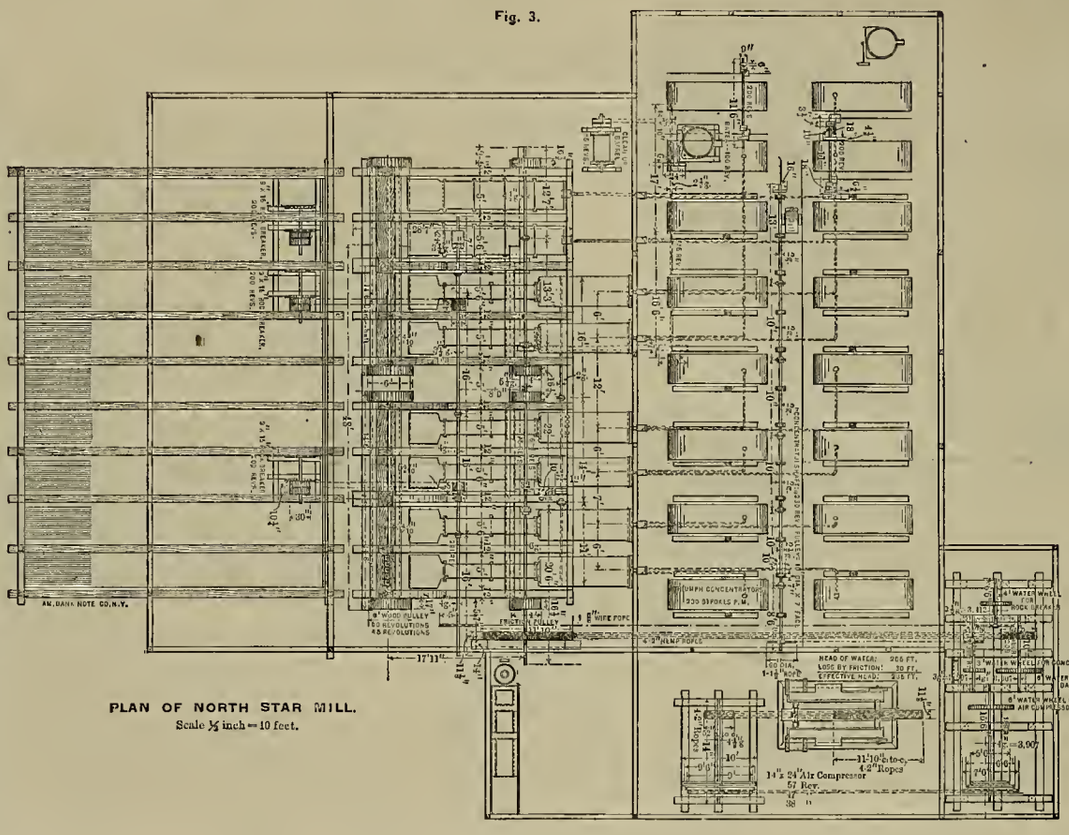
The local topography presented most favorable conditions for a mill-site. At a distance of only 142 feet from the landing floor of the main incline of the mine, it was found possible to discharge the ore at a vertical height of sixty-seven feet above the projected concentrator floor. Fig. 1, showing a cross-section of the mill-site, illustrates the topographical features utilized in locating the present North Star mill. During the construction of the mill all mining operations continued uninterruptedly, the ore extracted being crushed in leased plants one mile distant.

Fig. 1.



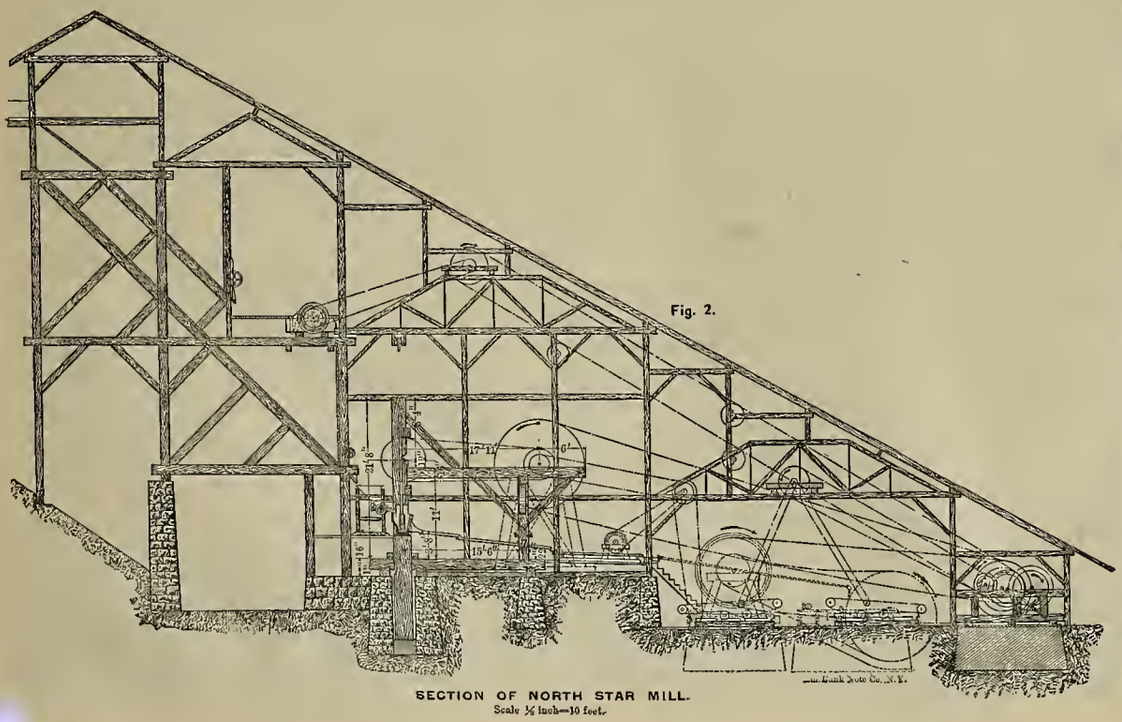
SECTION OF NORTH STAR MILL SITE.
Scale ⅛ in. = 1 ft.

Fig. 3.



PLAN OF NORTH STAR MILL.
Scale ¼ inch = 10 feet.

Fig. 2.



SECTION OF NORTH STAR MILL.
Scale ¼ inch = 10 feet.

From the numerous stopes the ore is trammed to the main shaft, which has now reached a depth of 2400 feet, with an average incline of twenty degrees. The shaft is well equipped with a double track-way, over which 140 cars can be delivered to the surface in nine hours, actual running time. One man on each shaft delivers the quartz to the mill and waste to the dump.

The ore, as raised from the mine, is delivered in mine cars, containing a little over thirteen cubic feet each; three cars making forty cubic feet, or two tons of ore. Sorting on the surface is not resorted to; underground, however, the custom of "stripping" the ledge *in situ* insures for the mill a clean product, generally free from diabase (the enclosing rock).

On passing into the mill the ore is discharged over grizzlies, placed at the top of long ore bins. There are eight fine-ore bins, one for each battery, of five stamps, each provided with a grizzly 4x12 feet in size, set at an angle of forty degrees. The 3x¾-inch bars are placed on edge, two inches apart.

These grizzlies simply classify the mine ore into fine and coarse. The former drops through the grizzly directly into the fine-ore bin, from which it passes through a gate, supplying the automatic feeder, which in turn supplies its own particular battery. Meanwhile, the coarse ore is delivered over the grizzly into the coarse-ore bin, from which it passes through a gate into one of the three rock-breakers. From the breakers it drops as "fine" into the fine-ore bin, mixing with the mine-fine, and passing on into the ore-feeders as above described.

The ore thus passes, by gravity alone, from the dumping-floor to the automatic feeders. One man on the day shift operates the rock-breakers to crush the accumulated coarse ore delivered from the mine. The breakers (improved Blake, 9x15 inches) run intermittently, aggregating not over seven hours' work during the 24.

From the automatic feeders the quartz is delivered into the batteries for stamping and amalgamation. The free-milling character of the material demands only the simplest methods of amalgamation and concentration for the recovery of its gold contents. The pulp discharged through the battery screens flows over silver-plated copper amalgamating plates to concentrating machines beyond, passing thence for further treatment in pans, or escaping from the mill direct as tailings.

This brief outline of the course of the ore through the mill is illustrated by Figs. 2 and 3, which show a section and plan of the mill, and exhibit the very advantageous arrangement of the entire plant.

(Concluded in our next issue.)

The Center of the Strike.

The present great labor strike lends unusual interest to the town of Pullman, Ill., the center of the storm.

On the west shore of Lake Calumet, about fourteen miles south of the Chicago City Hall, is a strip of territory running two miles north and south and about half a mile in its average width. This is the town of Pullman—the Thirty-fourth Ward of the city of Chicago.

The town has a population of over 13,000 and is probably one of the most beautiful of Chicago's suburbs. The land upon which it is located was purchased by Mr. Pullman in 1880 for $800,000. At that time there was one family of four persons living there. The latter part of 1881 the first shops were completed, and February 1, 1882, saw 2084 residents, all living in houses rented them by Pullman, on money paid them as wages by Pullman, with which they purchased the necessities of life from men who rented their stores from Pullman. This condition of affairs has only altered in its increase of magnitude.

The rents for the dwellings are payable precisely as are the wages of the men who are employed by the company—twice a month. Shade trees border both sides of all the streets and are cared for, like all parks, lawns and streets, by the company.

There are nearly eight miles of paved streets that average sixty-six feet in width. The main boulevard and One Hundred and Eleventh street is 100 feet wide. The streets are well drained, provided with catch basins and there are handsome grass plats between the driveway and the sidewalk.

A system of pipes, entirely separate from the drains for surface waters, takes the sewage from the houses and shops to a reservoir holding 30,000 gallons under the water tower. The sewage is then pumped from this reservoir to the Pullman farm, 140 acres, a lot of land situated about three miles south of town. The farm is irrigated with the sewage and it is estimated that 1,800,000 gallons of sewage are pumped there.

The dwellings all suggest a simplified modification of the Queen Anne style of architecture, that is, set off by the round-arched Romanesque appearance of the main buildings and shops.

These latter are devoted to the following industries: The Pullman Palace-car Works, the Union Foundry, the Alley Paper Car-wheel Works, the Chicago Drop Forge and Foundry Company's works, the Pullman Iron and Steel Works, the Calumet Paint Company's Works, the Pullman Brick Works, the Pullman Street-car Works, the works of the Illinois Terra-cotta Lumber Company, the Columbia Screw Works and the Standard Knitting Mills.

All of these concerns have something in common with the building of cars, and each contributes something to every car turned out of the town. There are about six miles of street-car line, and the cars are all of the latest improved pattern in the electric trolley system. There being about a hundred local trains a day for Chicago, there are abundant opportunities for social pleasures.

The wages and earnings in Pullman will average about $2 per day for every person employed. The average number of names on the payrolls at Pullman for one year was 5,455 and the wages paid was $3,331,527 41. The men are all paid by check on the Pullman Loan and Savings Bank and in that bank do they deposit all of their savings. In one year there was deposited $456,853 04, there being 1,903 depositors.

The company's revenue is enormous. The following is a summary of a recent financial statement: Revenue from earnings of cars, $871,145 07; from patents, $19,501 79; from manufacturing, rentals, dividends, interest, etc., $1,881,676 80; making a total of $9,772,324 66. The total disbursements for operating expenses, inclusive of maintenance of interior furnishings for cars, legal expenses, general taxes, insurance, interest on debenture bonds, dividends on capital stock, repairs of cars, was just $6,783,101 18.

This made an excess of revenue over ordinary disbursements, that was carried to the credit account, amounting to $2,989,223 48.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER VII.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

Many petroleum springs known to the ancients have been extensively worked in recent times. From those near Baku, on the west coast of the Caspian sea, large quantities are annually exported and consumed by the Russians.

The use of mineral oil as a source of light was well known in Europe in the seventeenth century. The following is from Milton's Paradise Lost, which was written in 1665:

> "The ascending pile
> Stood fixed her stately height; and straight the doors,
> Opening their brazen folds, discover, wide
> Within, her ample spaces o'er the smooth
> And level pavement; from the arched roof,
> Pendent by subtle magic, many a row
> Of starry lamps and blazing cressets, fed
> With naphtha and asphaltus, yielded light
> As from a sky." (Book I, lines 722-730.)

The use of mineral oil in the United States antedates history. The Indians of southern New York and central Pennsylvania were familiar with the petroleum springs of that region, and employed the crude oil medicinally long before the advent of the whites. The early European settlers in America, borrowing the idea from the Indians, gathered this oil and sold it under the name of "Seneca" and "Genessee oil."

The earlier white settlers of the American oil regions, about 1800, noticed "pits," so called, adjacent to the springs of brine and oil. Near Oil Creek, Pennsylvania, there are areas from four to five acres in extent, upon which are clusters of ancient holes from 6 to 12 feet in diameter, very close together, with trees standing in some of them, estimated to be at least 100 years old. The present Indians disclaim any knowledge of their origin.

These did not at first attract special attention; not more than the mounds and remains of earthworks left by the ancients, but as the country advanced in population and wealth, the people had more time, opportunity and inclination to study the subject. At first it was thought that the French, the first white settlers, had sunk these pits, obtained, and in some way consumed, large quantities of oil; but when it was considered that so much labor would not have been expended unless the product was considerable, and that there is no history of oil being shipped to Europe in large quantity from America, this theory was abandoned. Others have suggested the idea that salt and not oil may have been sought.

Many of these wells were found at Hosmer Run, at Pithole (which may have taken its name from this circumstance) and near Titusville and elsewhere, where oil has lately been found in large quantity; in fact, they existed at nearly if not all localities where oil has since been discovered.

Some were oblong, from 4x6 to 6x8 and from 4 to 6 feet deep; some circular, others square. Some were cribbed with round logs stripped of bark and laid horizontally like those in a log house, while in others, logs 12 feet long were set vertically. The local Indians were ignorant of their use; the small quantity of oil required for medicines by them did not require such costly and extensive excavations.

Some historians claim that this country was anciently settled, or at least visited, by explorers from Europe, or possibly by the Phœnecians. Others think China was the fatherland of ancient Americans.

The Phœnecians had used the Syrian asphalt and oil, and were familiar with the Persian Baku locality. It has been shown that the Chinese used oil and gas long before the discovery of America by Columbus, and that the Persian fire worshipers flourished in very ancient times. If either of these people actually discovered this country, it is reasonable to suppose they knew the uses and importance of this oil and perhaps opened these pits.

In 1859 Professor J. S. Newberry, while at Titusville, Pennsylvania, noticed these depressions or pits in the bottom lands on Oil creek, in almost primeval forests, which he was at first at a loss to understand. But at a well sunk in one of them he found it had followed an evidently prehistoric shaft, cribbed with timber like the pits sunk in the copper mines of Lake Superior by ancient miners. The antique ladder was a small tree, the branches of which had been cut off five or six inches from the trunk, forming rude steps. He observed a similarity between this work and that of the oil producers on the banks of the Irrawady and the shores of the Caspian sea, and he was convinced that this was the work of prehistoric races, designated in America as "mound builders."

In early times oil was found floating on the surface of pools on the margin of Oil creek. It was collected by Indians and early settlers by spreading blankets on the surface of the water and wringing them when saturated into suitable vessels. The flat-boat men used to soak rags and tow with mineral oil and make "fire balls," so called, to light the darkness of the night as they floated down the stream on their way to Pittsburg and New Orleans.

From the earliest historical period of the European settlement salt springs were known in Virginia, Ohio, New York, Pennsylvania and elsewhere, first as "deer licks," so called because wild animals, seeking by instinct what their nature required, made trails in the forest leading from every direction to these salt water vents, and the pioneer huntsman, taking advantage of this circumstance, lay in ambush, and so obtained game in plenty. At some of the "big bone licks" in Kentucky, Ohio, and notably in the Mississippi valley, remains of extinct animals, including those of the mammoth and mastodon, are found. These deposits early attracted the attention of scientific men in all parts of the world. The Kanawha river was a noted locality of these salt springs and was at one time the center of the salt industry in the United States. As early as 1829 the product was 1,000,000 bushels annually. At Tarentum, on the Alleghany river, the brine pumped from salt wells contained considerable oil. This floated on the surface in a thin stratum, and could not wholly be kept out of the kettles, to the great annoyance of the salt boilers. After years of experiment, an invention was made which is now called a "seed bag." A bag of cotton, leather or canvas, filled with dry linseed, was slipped down outside the well pipe until it reached the opening through which the oil entered; the seed soon swelling with the moisture, kept back the flow of oil for which there was no use.

(To be continued.)

Wyoming's Soda Lakes.

As described by H. Pemberton Jr. and George P. Tucker, there exists a deposit of sulphate of soda, locally known as a "lake," about fourteen miles southwest of Laramie, Wyo. The deposit is composed of three of these lakes lying within a stone's throw of one another—the Big Lake, the Track Lake and the Red Lake—having together a total area of about sixty-five acres. They are the property of the Union Pacific Railroad Company, and are connected by a branch of that road with the main line at Laramie, and are generally known as the Union Pacific lakes. In these lakes the sulphate of soda occurs in two bodies or layers. The lower part, constituting the great bulk of the deposit, is a mass of crystals of a faint greenish color, mixed with a considerable amount of black, slimy mud. It is known as the "solid soda," and is said to have depth of some thirty or forty feet. Above this solid area occurs the superficial area of pure white crystallized sulphate of soda. This is formed by solution in water of the upper part of the lower body, the crystals being deposited by evaporation or by cooling, or by the two combined. A little rain in the spring and summer furnishes this water, besides which innumerable small, sluggish-flowing springs are present in all the lakes; but on account of the dry air of this region the surface is generally dry, or nearly so, and in midsummer the white clouds of efflorescent sulphate that are whirled up by the ever-blowing winds of Wyoming can be seen for miles. The layer of white sulphate is from three to twelve inches in thickness. When the crystals are removed the part laid bare is soon replenished by a new crop.—Popular Science Monthly.

New Electric Locomotive.

There is an electric locomotive in course of construction in Boston according to the *Transcript*, which promises to meet all the requirements for propelling railroad trains. It is an eight horse-power machine, and it is unique. The distinctive feature of the invention is the substitution of a piston and cylinder in place of the usual rotary motor for the application of power.

The cylinder is much lower than for steam purposes, and has in its interior a series of magnets. The piston passes entirely through the cylinder, with cross-heads at either end. On the piston within the cylinder is a series of armatures of peculiar construction. On the axle of the driving-wheels are commutators, whose function is to apply and cut off the electric current, just as the eccentrics control the steam of a steam-engine. It is practicable to run the machine at 200 revolutions of the axle per minute, and with a driving-wheel eight and one-half feet in diameter and the crankpin three feet from the center there would be a six-foot stroke under a full head of power. The machine is adapted to receive the electric current either by a trolley wire, a third rail in the track or from a storage battery.

Mining Districts of Mariposa County.

The Coulterville district embraces all that portiou of the county lying north of the Merced river, extending from the Merced line to the dense forests and granite domes of the Sierras easterly, and northerly to the Tuolumne line. The district is gridironed with gold-bearing quartz veins. The town of Coulterville is the business center aud only town of note on that side of the river. The territorial extent of this district is more than five times that of "Los Mariposas." The yield in gold from the crude workings in quartz and the primitive methods of placer mining cannot be definitely estimated. It includes several hundred claims recorded under the local laws, and about 25 covered by U. S. patent. The list of patented mines embraces several which have heretofore yielded good returns and are still believed to be valuable if systematically and skillfully worked.

The following are among the prominent mining properties held by the owners under original patent and undisputed title in the district: Penyon Blanco, Tyro, Black Hill, Margaret, Virginia, Louisa, Delia, Midas, Anderson, Mary Harrison, Melvina, Adelaide, Crown Lead, Crystal, Ventura, D. Cook, Melvina No. 2, Red Cloud (or Kate Kearney), Potosi, Louisiana, Banderita, Hasloe, Compromise (formerly Marble Spring) and the Ohlmeyer placer claim.

The Hornitos district includes the town of Hornitos, old Quartzburg, Indian Gulch and a portion of Cathey's valley and all the territory west of the westerly line of the grant and south of the Merced down to the northeasterly boundary of Merced. Within its boundaries are located the Mt. Gaines, Enterprise, Doss, Washington No. 9, Pool group, Indian Gulch gold and silver quartz mine, Jenny Lind, Duncan, Gonzales, Juniper, Jim White, Tandem copper mine and Lorenzo Costa (a placer mine near Hunter's Valley).

The Sherlock district, lying northerly and easterly from the grant, comprises the mines located in the immediate neighborhood of Sherlock's, Whitlock's, Colorado and Sextou's creeks and their tributaries. But a small percentage of the mines in this district are held by patent. The following comprises the list so far as heard from: Whitlock, North Whitlock, Speucer, Feliciana, Sierra Rica, Roma, Colorado, Sierra Rica, Bogan and Battaille; Deltz and the Schroeder, Jones Flat, Goldeu Eagle and Spring Garden placer claims.

The district designated as Sweetwater includes the mines along the headwaters of the creek from which it takes its name as well as Bear creek aud the main and south fork of the Merced. The most prominent mines in this district are the Hite, Cranberry, Rutherford, South Side, Georgia Point, Spring Tunnel, Hite Central and Priest & Coleman. Those are held by U. S. patent. The statistics of the Hite mine show that it has yielded $2,250,000 during 20 years—about two-fifths of the entire product of the Fremont Grant during the same period. To further illustrate the mineral resources of the several districts aud their improved conditions and prospects, a few details are appended.

The Whitlock Mine.—This was one of the earliest quartz locations in the county, dating back to 1853. The first practical work was done in the latter part of the fall of that year by Morris and Goodmau, who built the pioneer quartz mill on Sherlock's creek in 1854. A few years later a new mill was coustructed on Whitlock's creek, just above its junctiou with Sherlock's. The property chauged hauds several times and was subsequently owned by Diltz and Snooks, then by Snooks and Marshall and other parties in interest. It was loosely managed, till it became involved in debt and fell into the hands of Sullivan & Cashman some time in the early sixties. About 30 years elapsed before any further attempt at practical work was made. In 1891 the property was purchased by Capt. A. H. Ward, who is now the owner of this and the Spencer, an adjacent vein. Ward cleaued out and retimbered the old tunnel—a distance of 850 feet from its initial poiut—and then sunk a shaft aud made an upraise to the surface, prospecting as the work progressed, the developments indicating that the mine was better than was at first anticipated. In August last the owner bonded the mine to William Johns, the general agent of the Sierra Buttes Co., who are engaged in several important mining enterprises in other portions of the State, notably the Sierra Buttes in Sierra aud Plumas counties, the Uncle Sam in Shasta aud the Eureka iu Plumas. Mr. Johns is an experienced mining man aud eminently cautious and conservative in the matter of investments. Under his management the cleauing out of the old tunnel was resumed and carried to its terminus, which proved to be 1215 feet from its mouth. It is now being pushed ahead and following the course of the vein, which is from six to seven feet wide aud carries a heavy body of paying ore. The shaft at a point in the tunnel 800 feet from its mouth was sunk by Ward about 70 feet and continued under Johns' management to a depth of 162 feet below the tunnel level, or 362 feet from the surface. At this point drifts were started uorth and south, following the course of the vein, which at the latest accounts showed a width from six to eight feet of good milling ore, which was improving in quality and quantity as the work progressed. Capt. Mills, the superintendent, is an experienced miner. He has a force of 25 men employed and the explorations are being pushed as rapidly as possible. He expresses a favorable opiniou of the miue.

There are several other claims located in the same district which are being opened and developed. The Spencer, Alabama and Farmer's Hope are on the list. The range through which these veius run faces Sherlock's creek on the northeasterly slope. Sherlock's was noted for its extraordinary yield of gold in the days of placer miuing, and from 1849 down to 1856 held the foremost place among the gold producing placers of Mariposa county. The possibilities of future developments in the extensive group of gold-beariug quartz veius in that locality are incalculable.

The latest aud most important development in the Whitlock group was made on the Spencer vein a little over a month ago. In running a tunnel which was commenced last season, a stringer of quartz was struck, which was followed and led to a well-defined lode about three feet in thickness at the point of contact. It carries a strata of ore fully a foot thick, rich in free gold, copper, sulphurets and galena. It differs in character from any ore heretofore discovered in that district. So far as prospected the vein appears to be regular in dip, direction aud thickness, and the ore-beariug strata holds its relative proportion and has improved in quality. The Spencer will soon be on the list of paying mines. It is not included in the property bonded to the Sierra Buttes Company, but is still owned by Capt. Ward and operated under his direction.

The Hornitos District.—One of the best paying quartz mines in Mariposa county at this date is the Enterprise, located in the Hornitos district, on Burns' creek, about a mile from the site of the historic town of Quartzburg. It is now owned and operated by R. W. Barcroft of Hornitos. It was originally known as the Mineral Mountain mine, and was owned by Hassey and Brownfield of Hornitos and Major Harawick of Quartzburg. It yielded very fair returns, and even in the flush times was considered "rich." This was in the first decade of quartz miuing and at that date when "wages" meant from five to eight dollars a day, and when all the appliances for hoisting ore, pumping and blasting were crude and cumbersome and a mine had to be "rich" to cover working expenses and leave a small margin of profit. The water came in and became troublesome. About ten years ago Barcroft organized a small company for prospecting purposes, and thereafter the name was chauged to the Enterprise. They cleaned out the old shaft, which was 70 feet in depth, and on that level ran a drift 80 feet; then they made an upraise of 18 feet and ran a short drift to intersect an old tunuel from another old shaft 54 feet deep. All this work proved to be in good paying ore. In running a drift ou the lower level they struck a heavy body of rich sulphurets and strata of quartz carrying free gold.

Barcroft is an old pioneer miner, with all the tenacity of purpose which characterizes that class of Californians, and laboring under the usual financial embarrassments euvirouing a "49er." Hence the delay in getting things in running order, and it was not until August last that the mills, hoisting works and other appurtenances were completed. He now has in operation an eight-stamp mill with a crushing capacity of 12 tons a day, good hoisting works and a No. 4 Hooker steam pump. To this he has recently added a concentrator of the latest approved pattern.

The ore extracted in the explorations was crushed and the yield was satisfactory—noue of it paying less than $10 per ton and running as high as $20. The owner of the mine had contracted to crush a large amount of ore for outside parties during the winter, which to a certain extent interfered with the develment of the Enterprise, but work has been recently resumed.

The Mt. Gaines mine, another case of suspended animatiou, near the westeru base of the Bear Valley rauge, was reopeued last season with profitable results.

The Hulings property, embracing the Pool group, No. 9 and other mines, has recently been purchased by M. L. Rogers, the owner of the Washington mine. This latter has the deepest shaft and workings of auy mine in the county, having been worked to a depth of 1600 feet.

Another group of mines southerly from the town of Hornitos, including the Doss, Eureka and Quartz Mountaiu, has come to the front duriug the past year. The Eureka is owned by Rogers and the Doss by the heirs of the Brooks estate. This latter was opened a few months ago after several years of rest and is being thoroughly prospected. The vein is well defined and carries an immense body of gold-bearing sulphurets.

Coulterville District Alive.—Evidence of vitality and a renewed and active interest in the quartz mining industry are particularly noticeable in the Coulterville district. The Louisiana—formerly known as the Heslip mine—has been bonded to Messrs. Gove and McKenzie, who have had considerable experience in practical mining and are now pushing ahead in the development of a valuable property which has been lying idle for nearly twenty years.

Practical miners have taken hold of the Banderita and reports are to the effect that a valuable chute of ore has been developed, yielding (as it is stated by those who have the opportunity of personal observation) as high as $40 per ton.

The Pinon Blanco, on the great "Mother Lode," was bonded a few months ago, the real parties in interest being a wealthy English company, though no positive information has beeu given to the general public as to the bedrock facts.

The Tyro mine, about a mile west of the town of Coulterville, is owued by F. C. Jarvis of San Jose. The death of Charles Sutherland, the managing superintendent, and busiuess complications connected with its management, resulted iu a suspensiou of work. Operations will be resumed in the near future. The vein at the depth of 600 feet—the lowest point reached—is fully five feet in thickness, carrying free gold and a fine quality of sulphurets, which were concentrated and shipped for reduction.

Simultaneously with these movemeuts, work has been resumed ou the Bondurant and Red Cloud after a prolonged seasou of inactivity. Superintendent Hopkins of the Red Cloud reports favorably upon the condition and prospects of this mine.

The foregoiug statistics are derived from reliable sources, and although not entirely covering the field of active operations, will serve to illustrate several important facts: First, that the Mariposa grant is insiguificant in area and value compared with the entire county, three-fourths of which is mineral in character. Second, that in the matter of depth the limit of paying ore has not been reached. In illustration, the Princeton shaft, 600 feet; the Hite mine, over 900 feet; and the Washington, about 1600 feet in depth, may be cited as instances. Third, that Mariposa is awakening from a Rip Van Winkle sleep, with a fair prospect ahead for an era of prosperity.

To these, in the matter of statistics, may be added the fact that, outside of the "grant" there are over fifty mining properties held under U. S. patents. The number of unpatented claims recorded and held under the local district laws cannot be readily computed.

The Question of Power.—With a few isolated exceptions, the location of the best mines is convenient for the direct application of water power for mills and other machinery—the Merced river being the only stream of reliable volume. Hence, as a rule, steam power has been necessarily employed. The local supply of fuel has never been very abundant, and with the constant drain upon the scattering groves of timber for domestic firewood, lumber and fencing material, points to an era in the near future when a more economical policy will be forced upon the people. Without discussing the wasteful and reckless methods heretofore in vogue, the impending scarcity of fuel in the foothills is so palpably apparent that he who runs can read the lesson. The item of "wood" has figured largely in the expense accouut of mining euterprises, and may be set down as au important factor in the wasteful methods which have culminated in suspension, abandonmeut and financial wreckage.

As an example, take the Washington mine, where for several years the cost of wood for running the mill, hoisting and pumping machinery, and incidental appurtenances averaged over $75 per day. This serves the purpose of an object lesson and fairly illustrates one of the disadvantages under which the quartz-mining industry has labored.

The recent achievement in the application of electricity as a motor, when harnessed to an unlimited water power as the generative agent, points to a practical solution of the problem. The Merced river, from the floor of the Yosemite valley down to the western boundary line of the county, has a fall of about 3700 feet. The stream is perpetual—a surging torrent during the severe winter rains and in the early spriug months, and eveu at its lowest stages carryiug water enough to furuish power sufficient to run the quartz mills and other machinery for all the mines in the county, and au electric railroad through the foothills to the Yosemite valley, the Big Tree grove, or any altitude where wagon roads have heretofore been constructed. The distances from convenient points on the river for the necessary water supply and the mines where the electric power can be utilized will range from five to fifteeu miles. The limit of distance for the transmission of power by wire has not yet been reached, but practical experiments have demonstrated that for any of the short-range requirements in counection with the mining operations herein noted, the subtle agent can be transmitted without auy appreciable loss.

These facts have not escaped the attention of the mine-owners, and several parties interested in the development of the miueral and other resources of the couuty have been moving in the direction of organizing a company with the object of utilizing the wasted forces of this magnificent stream for the purposes herein mentioned. Estimates are given of cost of construction of dams and all the appliances, together with an electric road, haviug its termiuus at a point couvenient to Yosemite valley, and an outline statement in detail of the profits which will naturally result from the enterprise. These details have been embodied in a prospectus which, when rearranged and more fully elaborated in some impor-

tant particulars, will be given to the public. The enterprise has been made the subject of deliberation and discussion for several years by men who fully comprehend the situation and have the courage of their convictions but, unfortunately, lack the sinews of war for carrying on the work to a successful issue. Capital just now is held in a tenacious grip—the consequeuce of investments in inflated securities; hence the nervous condition of the money market. With the recovery of a healthy tone in finance, no enterprise promising such grand results will go begging. Mariposa's mineral resources are second to those of no county in the State, and practically are only in the first stages of development. The utilization of the Merced river and its application to the electric dynamo solves the problem of cheap power. It is the key that unlocks the golden gate of financial prosperity in Mariposa county.

Scientific Progress.

Direct Treatment of Pulp by Cyanide.

A modified method for securing direct treatment of the pulp leaving the battery, says the Australian *Mining Standard*, is to be tried in connection with the cyanide process by the Robinson Company at Witwatersrand. Where pulp has been run direct into cyanide vats, two difficulties have been generally eneountered, one being due to the packing of the sands as a consequence of currents in the solutions from which they are mechanically deposited, and the other to a segregation of the "slimes," or finer particles of the pulp, giving rise to imperfect filtration and extraction. These difficulties have, to a certain extent, been overcome by the use of hydraulic separators at some of the mines, but the principle of the method which will now be tried at the Robinson Company is to allow the pulp to settle through solutions which, below their surfaces, are in a state of rest, it being fouud that, by this means, successive portions of the sands carry down with them a certain proportion of the slimes; that an intimate mixture, without segregation, is thereby brought about, and that, in eonsequence, the resulting product is easily susceptible of cyanide treatment.

With this object, the pulp leaving the battery is run direct into intermediate vats fitted with hottom discharges in which the mixing is effected, prior to the tailings being carried to the cyanide vats proper for treatment. It is asserted that the extra eost due to the necessity for a single handling is extremely small, aud that the slight economie disadvantage thereby oecasioned is amply counterbalanced by the increased percentage of extraction that can be seeured, as a consequence of the tailings having bcen brought into the eoudition most suitable for chemical treatment, the mixing of the "slimes" and sand effected in the vats being naturally assisted by the discharge and redelivery from trueks. To ensure a distribution of the pulp in a uniform manner without violence over the whole surfaee of the intermediate vats, an arrangement resembling in principle a garden sprinkler will be made use of. The eost of the extra vats required for this intermediate settling proeess will not be large, as the moment a vat is full it eau be at onee discharged.

A Paper Fire Engine.

The Fire Department of Berlin has a fire engine, the earriage of which is construeted entirely out of papier mache. All the different parts, the body, wheels, pole, etc., are finished in the best possible manner, While the durability and powers of resistanee possessed by this material are fully as great as those of wood, the weight is, of course, much less. The lightness of a fire engine is, of course, a great advantage, and it seems not unlikely that wooden carriages will in a short time pass out of use altogether.

Light on Logarithms.

An expert engineer in a New England city rendered a bill to a eorporation who had employed him to write a technical report. The amount of the fee was large, the corporation refused to pay it, and the claim was carried into court.

During the trial the counsel for the corporation sought to belittle the expert's work, raising questions as to his experience, and, in fact, to prove that his labor would have been amply rewarded with a few dollars a day.

"How did you reach this result?" asked the lawyer, referring to a certain calculation which had involved the use of logarithms.

"I consulted Napier's table and"—but he got no further.

"You consulted Napier's table, did you?"

"Yes."

"Do you mean to tell this court that you, an expert, had to resort to a publisbed table? Did you prove the figures of that table?"

"No, but they have been proved. They are considered to be aecurate by every scientific man."

"Why do you not work out your own table of logarithms? Is it not because you are unable to do so?"

"It is not. I am perfectly capable of preparing such a table: but it would have taken too long a time to do so, and so I consulted the standards."

"In order to prove your calculations as well as your capabilities in this matter," continued the suspieious lawyer, I will now ask you to prepare a table of logarithms."

"Here and now?" inquired the plaintiff. "I fear it will eonsume too mueh of the court's time."

This seemed to confirm the lawyer's doubts, and so he insisted the more upon having a eomplete table of logarithms prepared.

The plaintiff smiled maliciously, took paper and pencil and began his work. In about five minutes the lawyer asked him if he had finished. The plaintiff shook his head and continued at work. Ten minutes passed by and again the question was put:

"How nearly finished are you?"

"Very far from finished," remarked the plaintiff.

"Well, may I ask how long it will take you to prepare a table such as Napier's? You seem to be very slow about it."

The expert hesitated a little and then repbed: „"I estimate that, working alone, I might be able to complete it in about 15 years, working day and uight. It took Napier and five assistants seven years to prepare his table, but I am less familiar with the ealeulation than he was, and, as you say, work slow. Still, in 15 years I think I eau complete it."

It is unneeessary to say that the lawyer was not a little taken aback by the answer, which enlightened him a trifle on the subject. He withdrew the questions, and eventually the expert wou his ease.

Photography—Astronomy.

In a leeture recently debvered by Edward Barnard in this eity, he said that the introduction of photography into astronomy has gradually effeeted quite a revolution, and necessitated modifications in great teleseopes. Photography takes what the eye cannot do, for it is cumulative. It stores up the effect of bght aetion during minutes or hours, consequently reveals facts which eould not be ascertained by human vision. With eye observatious, if the driving clock falls a little out of time, and a star passes off the mierometer wire, the observer can shift the telescope a little and bring it back again. With photography this is not possible. Moreover, a slight shifting of the instrument will give an elongated image of large stars and a double image of small ones. The teleseope, therefore, must be driven aeeurately, no deviation of more than one-twentieth of a second being permissible.

The driving mechanism, therefore, has to be of the highest quality; any deviations of the elock have to be forthwith correeted by means of another timekeeper, and the telescope at once brought back to its true position. This extra timekeeper is a pendulum beating seconds, and driven by electrical pulsations. At each beat it sends local electrical pulsations through a portion of the mechanism of the clock, while exercising its functions. Every portion of the whole instrument must be made to give its aid; the telescope must be rigid, firm, and the axis of every part fairly accurate. The current from the governing pendulum can return from the clock by either of three routes, all of which come into circuit one after the other; and when everything is right, it gets back by the central contact. This part of the apparatus is called the detector, because it detects any error. If the current gets back through either of the others, the error is corrected by means of a relay, electro-magnets and differential gearing. He rang two bells by means of the pendulum, each bell sounding seconds synchrouously; then he threw one of the bells greatly out of time. The governing apparatus then corrected the error step by step, until in a few seconds the bells were again beating synchronously. By this system, he said, it is impossible to introduce a time error without its being corrected.

Selby Smelting and Lead Company,

416 Montgomery Street, San Francisco.

Gold and Silver Refinery

—AND—

Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of

Mechanical Progress.

Two More European Cables.

Two more cables are being laid across the Atlautic. There are at present ten cables connecting the Old with the New World, but so rapidly has the cable business grown that they are inadequate to handle it all. It was on August 16, 1858, that the first message was sent under the Atlantic, but the cable broke down 23 days afterward aud communicatiou was uot resumed until July, 1866, since which time it has been uninterrupted.

The original charge for a message, while there was only one cable in existence, was $5 per word, but the laying of uew cables, with consequent competitiou, has brought the price down to 25 cents per word, and, as a result, the business has enormously increased. Now one of the cable companies is adding to its equipment by putting down two new cables, the shore ends of which are now beiug laid. No cables had been laid during the previous ten years, but experiment in the meanwhile has shown many improvements, and these have been incorporated in the new lines.

The cables have beeu made by Siemens Bros. & Co., whose factory at Woolwich, England has been working night and day to complete the order, so that the cable may be laid during the early spring. Altogether 2201 uautical miles of cable have been made, and these consumed 495 tous of copper wire, 315 tons of gutta-percha, 575 tons of jute yarn, 3000 tons of steel wire and 1075 tous of compound aud tar, making a total weight of 5460 tons. The order for the cable was given November 21st of last year, aud rapid work was begun at once.

The cable is largely made by machinery, and the twistiug of the wire and covering with tar and gutta-percha are done by automatic apparatus. The deep-sea portion of the cable, which is the smallest part of it iu size but the longest in length, was mauufactured at the rate of five uautical miles per day by one machiue, and there being teu machines of this kind at work, there were 55 miles of deep-sea cable turued out every 24 hours. The shore ends of the cable, however, required much more time to manufacture. It is necessary that these should be very large and strong. As long as the cable lies along the bed of the oceau it is out of harm's way. No storms, however violent, can reach it. It is uot affected by any change of the temperature, and it is too deep to be molested by fish or any kind of marine creature.

It is therefore only necessary that the copper wires of the "core," which conveys the message, be thoroughly insulated and kept dry. This is accomplished by their being covered with a coating of jute and gutta-percha, over which is a sheathing of small steel wires. This sheathing increases in strength and protective power as the shallow water is approached, aud there are seven different sizes in the new cables. This "core," containing the copper wires along which the messages are sent, is carried through all sizes unchanged. The heaviest part of the cable is that which is near the shore, where the motion of the waves may wash it to and fro among the rocks and stoues, that would otherwise soon cut it. Along the banks of Newfoundland fishing schooners auchor and occasionally pick up the cable, and that contingency has to be provided for in weight and strength.

From the time the cable is fiuished until it is paid out over the stern of the cable-laying steamer Faraday, it is never allowed to get dry. It is kept in large tanks of water and transferred to such tanks aboard the Faraday, where it is coiled up. The Faraday, coming back some six weeks or a month later, will look around for the buoy in order to pick up the cable again.

Thus, passeugers across the Atlantic this summer may see a buoy away out in the ocean, but mariners will be warned to let it alone, as it marks the end of one of the sections of the new cable. The Faraday can lay the deep-sea portion of the cable at the rate of seven nautical miles per hour, proceeding under almost a full head of steam. The cable is simply paid out from the stern like a rope. Occasionally, however, the steamer will stop and pay out a lot of cable before proceeding. This is done where she comes to a cliff or sudden fall iu the bottom of the ocean, which is not level, as some people imagine, but has all the topographical features of dry land.

The Faraday is provided with maps of the bottom of the ocean as accurate as if made by submarine surveyors. At all points it is sought to have the cable actually restiug on the bottom and not stretching from hill to hill. While the Faraday is layiug the cable the electricians on board are constautly keeping up communication with the shore, so as to see that it is in good running order, and while in the middle of the Atlantic the officers of the ship may learn the latest news. When a buoy is picked up the submerged end of the cable is slowly hauled aboard and carefully spliced to the other section. It is estimated that the Faraday will lay the deep-sea section of the cable in about ten days.

Dowe's Cuirass.

Much interest has been manifested both in England and America regarding the new bullet-proof cuirass, consequeutly the following from our special commissioner regarding some experiments that were recently made in England will not be uninteresting to many:

Hiram S. Maxim has been so much disturbed at the fuss made about Herr Dowe's cuirass that he devoted au afternoon to making a similar one, and invited all aud sundry to see it tested at the Firth Gun Works iu Kent. Among those who attended, on June 1st, were Captain Dutton Hunt, Goverument Inspector of Musketry, and C. F. Lowe, a Queen's prizeman, both of whom had taken an active part in testing the Dowe cuirass, which weighs 12 pounds, and for which £200,000 sterling (practically a million dollars) is asked.

The Maxim cuirass is three pounds less in weight, and the price asked for the secret of its manufacture was the modest sum of seven shillings and sixpence, and the manager of the Aquarium has actually been supplied with one at this price.

For the purposes of the test on Junc 1st, a steel plate was placed iu line with the cuirass, and the bullets pierced the steel plate, making a hole as clean as if it had been done by a drill. The firing was done chiefly by Royal Marines, armed with the Lee-Metford rifle, black powder and cordite charges being used alternately. The German service rifle was also used with cordite charges, to show the greater penetrative power, which was, however, only shown on the cuirass by dents deeper thau those made with the Lee-Metford.

At the eud of the experimeuts, which were highly satisfactory, Mr. Maxim dissected his cuirass and showed that it contained a steel or iron plate about three-sixteenths of an inch thick, with a second and thin plate of nickel and some carbou between them, which is said to supply the necessary resistance. Mr. Maxim's exposition of his great "secret" was greeted with laughter and cheers.

The Manard team of sharpshooters met with disaster at the Canterbury Music Hall, London, England, on May 26th. The last shot of the entertainment was fired by Professor Manard at the lady wearing the bullet-proof coat, whose stage name is Miss Julie Manard. Through some carelessness on the part of the shooter the bullet lodged in the lady's neck. Fortunately it did not hurt her much, but this has seriously discounted the whole show, for it seems clear that the impetus of the bullet must have beeu very slight, which would imply that the bullet-proof coat has very little to resist.

Herr Dowe's cuirass has been exhibited publicly at the Royal Aquarium daily since May 28th, and the tests are quite as severe and as bona fide as those applied to the Maxim cuirass, but its weight is considered prohibitive, as it only protects a part of the chest, and the pad in which the protective shield is inclosed is so large as to interfere seriously with the movement of the arms of the wearer.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient economical and speedy for all Pacific Coast patrons

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Professional Cards.

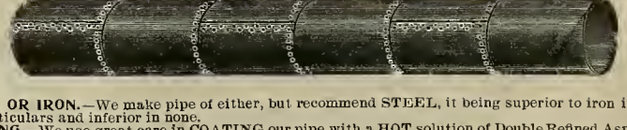
Plans and Estimates made for IMPROVED CYANIDE PROCESS PLANTS for Gold and Silver Extraction, and competent instruction for successfully working the same on a large, practical scale.

Mining Pipe!



STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.
COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

SCHAW, INGRAM, BATCHER & CO.,
SACRAMENTO, CAL.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

AN ENCOURAGING OUTLOOK.—*Chronicle:* The mining outlook for Calaveras county is very promising at present for a genuine mining boom. At Angels Camp they already have it, while at San Andreas and intervening country to the north boundary of the county, including Mokelumne Hill, West Point, Railroad Flat, Glencoe and El Dorado, there are signs of new life. Old mines that have been idle for years are being pumped out, prospects and new locations are attracting unusual attention, while hydraulic and drift mines are also being looked after by outside capitalists.

Kern.

J. W. Davis and R. M. Maddux have bought the Woody mine. This mine has been developed about a quarter of a mile in length, and in some places more than 100 feet in depth, the lead being well defined, varying from one to two feet in width. Some of the ore was recently worked by the slow process of a horse arrastra, and it was found to run from $20 to $60 per ton. It is the intention of Davis and Maddux to put up a Huntington mill on White river, three miles from the mine at the mouth of Grizzle gulch. A ditch one-half mile in length will carry the water of White river to the mill site, where a large overflow wheel will be used. The water in the river is sufficient to run a large mill more than one-half of the year. There is a large body of ore, perhaps 1000 tons, in sight, which can be easily extracted, and hauling will be cheap. It cost but little to complete the road to the site, and the grade will be a continuous descent from the mine to the mill. Both men are practical mechanics and miners, and they estimate that the ore can be worked at $5 per ton, or perhaps less, as the ore is free milling.

Plumas.

SUCCESSFUL WORKING. *National-Bulletin:* That hydraulic mining can be carried on in Plumas county without any material injury to the navigable streams or to adjoining lands, there has never been any serious doubt in the minds of practical mining men acquainted with the topography of the country and its location fully a hundred miles from navigable points. The operations of the Quincy Mining and Water Co. at Spanish Ranch, under the direction of the California Debris Commission, have conclusively proven the soundness of these views. Acting under instructions of the commission, the company built a series of restraining dams in Wapaunse creek, thus forming settling reservoirs, not only for the restraint of sand and gravel, but of still finer material. The restraining works are the most extensive and important erected by order of the commission. They are substantial and fully adequate for the purposes intended.

On Monday we visited the scene of operations; found the mine using two large monitors in washing down the bank of dirt and gravel, which is carried through a cut and sluice boxes and dumped into a storage basin above the upper dam, which basin is about a third of a mile long and widens out at the upper end, thus forming a basin valley-like in appearance, and of great storage capacity. The gravel and sand are deposited and spread out near the end of the sluice, while the finer material is carried into a lake formed in the upper part of the basin, and there permitted to settle. The water flowing from this lake carries no sand whatever, and only a very small amount of fine, flour-like, impalpable material held in suspension, even if it were to stop in navigable streams. But this it will not do; the extremely fine coloring material will flow unchecked to the sea. The amount of this matter escaping from the restraining works has been reduced to the minimum. At Spanish creek bridge, on the Indian valley road, 15 miles below the mine, hydrometric tests made in our presence, showed that the water carried only a bare trace of the so-called "slickens"—the merest fraction of one per cent. The same was true at the "Pocket" and at the bridge at the Mill's office in this valley. At the "Pocket" there was no evidence of debris piling up. Not long since, an expert examination was made of the bars in Spanish creek in American valley, and it was found there was no appreciable amount of deposit of silt resulting from mining by the hydraulic process.

The above facts show that debris can be restrained and that hydraulic mining can be successfully prosecuted in Plumas county, as has been and is now being done by the Quincy Mining and Water Company. This can be accomplished in numerous other places in the county. For the benefit of our own people and the prosperity of the State, we hope that it will be done. These mining enterprises employ labor, consume large quantities of supplies, extract and put into circulation lots of money, and thus contribute to the prosperity, progress and happiness of the whole people.

The Quincy Mining and Water Company is having surveys made by Mr. Keddie to increase the water storage and to bring in another ditch, so as to lengthen the water season. We understand that the company is well pleased with the cleanups made thus far, and that it has been discovered that it will be very profitable to save the large quantities of black sand in the gravel, for it assays $433 per ton in gold.

San Diego.

SOME LARGE STATEMENTS.—"Of the great mining enterprises in eastern San Diego county," says H. Harrison, "the average San Diego man is entirely ignorant. He may have heard of Cargo Muchacho, Picacho and Gold Rock, but his information ends there. He does not know that perhaps the most promising gold region in the United States begins in San Diego county and continues in Arizona in the region of Gila City. Old prospectors went over the country for years, and were satisfied that millions existed in the great ledges cropping out along the western banks of the Colorado, but the complete isolation of the country deterred capitalists from opening the prospects. Hardly over a year ago two green young men from Sioux City, Ia., named Hedges, took hold of the Gold Rock mines. Within the past month, to my personal knowledge, they have refused an offer of $2,000,000 for the property. There is a man here in San Diego who happens to know that they were offered $1,500,000 some months ago, which they refused.

"The Gold Rock mines are situated five miles north of Oglesby station on the Southern Pacific. They are fourteen miles from the river. In the past year Hedges, Fuller & Co., the owners, have put up a forty-stamp mill and a complete pumping plant, bringing water from the Colorado. They are about to put up an additional forty stamps. Fifty men are employed, and eight miners keep the forty stamps going. There are thousands of tons of ore already mined. The ore runs on an average of $10 per ton, and the owners are clearing $30,000 per month, with forty stamps. The cost of milling there is only $1.80 per ton.

"The size of the vein? Well, you would have to measure the mountain to find that out. You could turn a six-mule team in the mine as it stands now, and the development has just begun, comparatively. The owners have other property just as big in the same district, of which nothing more than mill tests have been made. The amount of mineral in sight is tremendous. Denver men, Chicago men, Kansas City men and San Francisco men have been attracted to the mines, but the owners steadfastly refuse to sell. Prospecting is being done at a lively rate, and since arriving in San Diego I have received word of discoveries in the district and around Pilot Knob, south of the railroad. The country rock is granite and limestone. All ore I ever saw in that country is free milling.

"The Cargo Muchacho mines are running again, and they are yielding the owners, Blaisdell & Co. of Yuma, a bonanza. About forty men are employed there. The mines are situated ten miles from the river, between the river and Gold Rock. Water is piped from the river. The mill has thirty stamps, and has plenty of ore to work. The cost of milling is the same as at Gold Rock—$1.80 a ton. There is plenty of wood in that section, consisting mostly of ironwood and mesquite. The ironwood is as heavy as mahogany, and costs, delivered at the mill, $4 per cord.

"Another great mining enterprise in San Diego county is the Picacho placer diggings. They are eighteen miles north of Yuma, on the river. They are about 800 or 900 acres in extent, and the dirt is worth forty cents a cubic yard. The plant is owned by Englishmen, the managers being Clayton and Alley Smith, Englishmen, who know nothing whatever of mining. They depend upon their superintendent, Col. Moreland, an American, who is as ignorant as they are. About $300,000 has been spent there, and mining men who have visited the diggings say the work has been botched and the money mostly thrown away, though experienced men could take hold of the proposition yet and rearrange the plant and make it pay big. Col. Moreland, like others who know nothing of mining, is a lucky fellow, and he has found a mine on the Gila river for which he has been offered $150,000."

Tuolumne.

MINING NOTES.—*Independent:* There is considerable activity in the mines at Quartz Mountain and vicinity. At the Dutch they are keeping the water out of their 210-foot shaft, awaiting the arrival of heavier hoisting machinery. This shaft shows a five-foot vein of excellent mining rock in the bottom, with more pay ore on the foot-wall side, the width of which has not been ascertained. Work of sinking will be resumed when the new hoist is in place.

The App mine is being worked steadily. They are drifting with Burleighs on their 800-foot level, to intercept the fine body of ore encountered on their 700-foot level.

The Miller and Holmes mine is rapidly improving as depth is attained. Their double-compartment shaft, which is now down 200 feet, is well constructed. The ore found is of payable quality.

The mill on the Golden Rule was started on the 27th ult. This mine is now the property of Messrs. McGinn and Cressy, and promises soon to resume its former record as a dividend payer.

The New Era, containing the same character of ore as the Golden Rule—which mine it adjoins on the south—presents an excellent opportunity for mining investors. The same vein that makes the Golden Rule mine, being the eastern slate series of the mother lode, occurs here through the entire length of this property, and carries gold in paying qualities wherever sunk on. The deepest shaft is 80 feet.

The Jumper, adjoining the New Era on the south, being the property of Mr. Fisher, is still idle. This mine contains a fine shoot of rock near its northern boundary. There is a dump of 100 tons of rock extracted from their shaft, which will mill $20 per ton.

Further south, on the mother lode, is the Mammoth mine, near Jacksonville. This mine is now being operated by Messrs. Stent, Witney and McDougall. The development work now being carried out surpasses the most sanguine expectations of the fortunate prospectors. The north drift has been advanced 164 feet. This vein shows a width of from 10 to 25 feet of rock, showing by tests $6 to $20 per ton in free gold. The property is being opened by tunnel. It is the intention of the present mine-owners to run in a tunnel near the level of Woods creek, where they can obtain 900 feet of backs. The shoot on this property is 1200 feet in length. A stamp mill will be erected immediately, as there is already enough ore in sight to keep 20 stamps running for as many years.

The Dead Horse mine, near Summersville, made a lucky strike when the 1300-foot level was reopened. The vein now encountered averages over four feet, and shows free gold in abundance.

The Parole mine, near Confidence, has been taking a few days' rest, awaiting the arrival of a large pump from San Francisco, which is expected soon.

The Belleview mine has struck very rich ore northeast of main shaft. The rock carries a very heavy percentage of sulphurets, iron pyrites and galena.

The Rappahannock is busily engaged in getting their machinery on the ground, to be placed at the south shaft. A large storehouse is completed and the superintendent's dwelling is being erected. The whole property is being fenced in with posts and wire. The development of center shaft is still in ore body. Cross-cutting is being continued.

NEVADA.

Washoe District.

The weekly official reports of the Comstock superintendents are thus summarized:

On the west side of the upraise on 1650 level of Con. Cal. Virginia, between south drifts 2 and 3, in the ore body recently found, are stoping out, and the ore in this direction is still looking well. Have been timbering and putting an ore chute in the upraise between south drift 4 on the 1700 level and south drift 3, which is 22 feet above. From these places we have extracted during the week 237 carloads of ore, about 235 tons, the average assay value of which per mine car samples was $67.57 per ton. No work has been done in the south opening on the 1700 level.

Have shipped during the week to the Morgan mill 552 tons 1070 pounds of ore, the average assay value of which per railroad car samples was $65.62. The average assay value per battery samples of all the ore worked at that mill during the week, 570 tons, was $58.92 per ton. Bullion now on hand in our assay office, assay value about $9600; bullion shipped to Carson Mint, assay value $37,588.67. Have been making repairs at the Con. Virginia shaft station on the 1520 level preparatory to the conducting of the water which was recently tapped in the west drift of the West Con. Virginia and California down to our 1650 level.

The west crosscut started from the main drift, 345 feet south from the shaft station on the 1000 level, has been extended 25 feet; total length, 60 feet; face in porphyry and quartz formation carrying a low assay value. At a point 280 feet south from the shaft station on the east side of the main drift we have cut out an opening and commenced sinking therefrom a two-compartment winze. Have been making the usual necessary repairs in the main drift.

The west crosscut on 1465 level of Ophir is stoped in harder porphyry, carrying clay separations. From north drift an east crosscut has been advanced 10 feet in vein porphyry formation. The north drift from west crosscut continues in old fillings, assaying from $3 to $8 per ton. From end of west crosscut a south drift has been advanced in quartz and old fillings, assaying from $5 to $15 per ton.

The Union Con. and Sierra Nevada joint north drift on 900 level has been extended 5 feet in hard porphyry. The joint south lateral drift is in clay and porphyry. Repairs prevented a greater extension of first-named drift. The west crosscut 1465 level of Mexican is in porphyry, clay and quartz. The workings of Best & Belcher on 200 and 800 levels are in soft porphyry and quartz.

The workings on 900 and 1100 levels of Hale & Norcross are in clay and porphyry.

IDAHO.

WORK ON PLACERS.—Wardner *News:* A number of the owners of placer mines in and around Murray are engaged in cleaning up, and from appearances and talk will show a fair average. The Spokane Hydraulic Company's water will be utilized on the Simmon's ground on Dry gulch as soon as the pipe can be run up, which will be in about a week.

OREGON.

WILLIAMS CREEK MINES.—*Courier:* There is considerable stir in the Williams creek ledges. The Bone of Contention has 20 men at work, some running a 1200-foot tunnel, some stoping, and others sinking an air shaft on top of the hill. They have struck five feet of good ore in this shaft, which is now down 50 feet.

The Ezzell mill started up Tuesday, running eight stamps. A large overshot wheel has just been put in position and it furnishes four or five-horse power night and day.

Anderson & Holyoke will start their mill this week. They got their power from the Gotcher ditch and will run night and day.

There will be about 100 men employed at the mines and mills on the Williams creek hill this summer.

IN SOUTHERN OREGON.—E. P. Thompson of Grant's Pass, in speaking of southern Oregon mines, says: "There is a great deal of activity in mining circles just now, and many properties that have been inaccessible during the winter, because of the depth of the snow, are being cleaned up for the summer run. Prospectors are just as numerous as in former years, and no complaints are heard of the country being prospected out. A large amount of development work is being done, and with very satisfactory results. The Bone-of-Contention, a splendid prospect located 18 miles southeast of Grant's Pass, has been sold by Messrs. Booth, Smith and others to H. E. Huntington. A force of men are at work developing the property. The Golden Eagle, in the Williams Creek district, recently had a cleanup. Some 80 tons of ore were run through, and averaged $20 per ton. The famous Hammersley mine, at Jump-off-Joe, is being operated by the man who discovered it, and the Lucky Bart and Ashland properties are all right. Placer claims everywhere are being worked with good results. The Wimer, Waldo, Simmons and Cameron & Ennis claims, on Galice creek, are proving good producers, the outputs thus far being fully up to the expectations of their several owners. There are many men scattered up and down the various creeks who are devoting all their time to washing out bars."

BRITISH COLUMBIA.

PLACER MINING ON THE FRASER RIVER.—*Mining and Mechanical Review:* M. H. Gibbs, a former Colorado miner, but who for the past few years has been prospecting in the country which recognizes Spokane as its central city, has recently returned from Yale, B. C., where he spent the winter doing a little placer mining and picking up information. Mr. Gibbs says that the gold fever has struck our northern neighbors and there is more activity along the Fraser river and its principal tributaries than there has been since the "golden days of Cariboo." The industry, however, has assumed a different form from that practiced in the early days when the rocker, pan and sluices constituted the method of gold saving, although there can still be seen at various points along the rivers small squads of men panning, rocking and sluicing; the returns are, however, small and the bars are one after another being deserted.

Dredging.—For 300 miles, from Hope to Quesnelle, on the Fraser, the ground has been leased and is being worked or preparations are being made to work it. There are now in operation or building not less than a dozen dredging machines, owned by men of means who have leased large tracts of ground, or, more properly speaking, water (for the dredges are all built on the centrifugal principle), with a view of working it this season and thereafter so long as it will pay.

Between Hope and Yale Messrs. Bell, McCaskell & Shehan have a dredge, the largest on the river, and a strongly constructed boat, with a centrifugal pump to suck the sand and gravel up from the bed of the river, which, with the water, passes through a receptacle charged with quicksilver, which catches the gold and allows the debris and other minerals to pass out. As is the case with all other dredges, nothing is attempted on the banks or above the water line.

At Boston Bar, which is about 25 miles above Yale, another dredger is working. The principle is the same as the one below, but the capacity is less.

At Kanaka Bar, 35 miles from Yale, or about 10 miles above Boston Bar, another strong company is operating with a channel dredge. At Lytton and again near Ashcroft, dredges are working or in course of construction. What the cost of construction or of operation is, or the capacity or percentage of value which is saved by the process, is as yet known only to the operators themselves; it is to be presumed, however, that the results are satisfactory, as several more barges are contemplated at other points along the Fraser.

Hydrauliceking.—There are several hydraulic companies working or preparing to begin on numerous tributaries of the Fraser, on the Lillooet, Bridge river, and Cayuse creek, a tributary of the former stream, where the Horsefly Company is putting in nine miles of iron pipe. There is considerable work also going on at Wilson creek and Willow river. The distances of these streams from railroad connections are: From Ashcroft to Quesnelle, 185 miles; to Horsefly creek, 150 miles; to Wilson creek, 285 miles; and to Willow river, 300 miles. Although the distances named may not be quite correct, they are nearly so.

Barkersville, at one time a live town where flour and bacon was worth almost its weight in gold, and the rendezvous and trading point of the miners of the entire Cariboo country, is assuming some of its former activity. This little frontier post is on the 53rd parallel, is on the old Cariboo trail and on the survey of the Cariboo railroad which leaves the Canadian Pacific at Ashcroft. The distance from Ashcroft by air line is in the neighborhood of 150 miles, but the routes traveled are much longer. The distance from Vancouver is 200 miles farther than from Ashcroft.

Miners are going into the country already in limited numbers, and it is expected that there will be an increasing number as the season advances. There are many of the smaller streams which empty into the upper Fraser which have never been mined systematically. The seasons are somewhat shorter than along the lower river, and in the days when no ground was worked unless it paid very high wages large tracts of good ground were entirely overlooked.

The Cassiar district, which is immediately west of the Cariboo, extends westwardly to the Alaskan boundary line and the Pacific coast, and has produced considerable gold, but the greater portion of the territory embraced within its limits is entirely unexplored, and may or may not be rich in gold treasure. It is reasonable to suppose, however, that there is a large and rich gold field covering a greater or less portion of it, for so far as explored from the Cariboo side, from the coast and from the south, together with the evidence of rich placers along the Yukon, some of the sources of which rise in this great unexplored territory, it can scarcely cease at the imaginary line of its boundary or at the limit of its explored district; in fact, the recent surveys made by the Canadian Geological Engineers along the Yukon and MacKenzie basins bear us out in this assertion, for gold was found at several points and in paying quantities. That prospecting in this far northern and isolated region, which is devoid of roads or trails, will be laborious and dangerous, will not deter the prospector but will add new zest to the task which he lays out for himself. The gold output in British Columbia no doubt will be greatly augmented during the next few years.

Electrical Progress.

The History of the Storage Battery.

Mr. Meyer Bloomfield asserts that uo other science preseuts such a variety of subjects for toil and thought as that of electricity, oue of the most important of which is the storage battery. Though the present applications of this battery are comparatively slight, its future usefulness seems so evident that it may be of interest to review its history aloue, and to take a look ahead iuto the future.

The storage of electricity, or rather the possibility of creating and retaining a potential difference within a glass or metallic vessel, first evinced itself in the discovery of the Leyden jar, which occurred in 1745. But this discovery, further than to show the possibility of electrical storage, has but little to do with our subject.

The observation of polarization in a simple cell led to some experimental investigations by Ritter and Gautherot, in the early part of the present century, the result of which was that the latter, in 1801, demonstrated the principle of electrical storage by immersing two plates of the same metal in acid, and having subjected them to the action of an electric current in one direction, connected the plates to a galvanometer and observed the production of a secondary current in an opposite direction.

In 1842 Grove constructed a gas battery, on the principle that the oxidization of the copper anode in an electrolytic cell produces electrical storage, which consisted of a three-necked flask, containing acidulated water, into which was inserted two inverted tubes containing respectively oxygen and hydrogen. Platinum wires sealed into the upper ends of these tubes were connected with platinum electrodes in contact with the gases above and the water below, thus the external circuit was completed through copper conductors whose terminals dipped into mercury cups. When the circuit was closed the gases recombined to form water, thus generating an electric current, which in the cell flowed from hydrogeu to oxygen and externally from oxygen to hydrogen, and whose E. M. F. was equal to that required to electrolyze water, so that the storage of electrical energy by chemical decomposition was recovered by chemical recomposition.

Other investigations followed, but in 1859 Gaston Plante's discovery of the special adaptation of lead plates for this purpose, opened the way for the practical use of electrical storage. Plante constructed a cell using as electrodes two large sheets of lead rolled together and electrically insulated from each other by strips of gutta-percha. They were then immersed in acidulated water, in a tall glass jar, and subjected to the action of a battery current supplied by two or more cells. The chemical reaction which followed resulted in creating a difference of potential between the terminals, which manifested itself in the discharge of the cell.

The tedious and expeusive process requisite for the electrical formation of Plante's plates led to the iuventiou of Camille A. Faure, about 1880, of plates prepared by covering sheet lead with a paste made of red lead aud sulphuric acid; the coating being confined to the surface by a covering of paper and by felt placed between the plates, which also served the purpose of insulation. Thus prepared and rolled together, they were placed in a glass jar with acidulated water and the coating subjected to electrolysis, and, with alternation of current, was in a few days changed to a spongy lead of differeut chemical composition than at first, the cell then being ready for practical use.

While the Faure cell could be produced much more ecouomically than the Plante, and was equal to it in electrical energy, it had such scrious defects that its utility was circumvented. The felt preventing the frec circulation of the current and seriously impeding electrolysis, it soon became corroded by the acid and partly removed in patches, and ceased to iusulate. The coating failed to adhere properly, sloughed off, and fell to the bottom. Hence, in a short time, the cell proved worthless. But its invention serving to direct the atteution of men like Brush, Swan and Sellou in this field, resulted iu the iuventious of many greatly improved storage batteries.

The storage battery of to-day. though not perfect, has nevertheless rendered much valuable service. Its applications are varied, and while not as yet very exteusive, they are sufficient to indicate that storage batteries may, in the uear future, occupy a very important place in the electrical industries. A fortune awaits the lucky man who invents a storage battery that will overcome all of the objections to those now in common use; and can confine electricity in cousiderable quantities withiu a small vessel, which will ever be ready to do man's bidding. Verily, the field of the future applicatiou of the storage battery is a vast one.

Troublesome Door-Bells.

Half the time when an electric doorbell will uot ring its owner can get over the difficulty by shakiug the glass jars or by adding a little water to them. When the jars are placed in a warm corner of the kitchen, which sometimes happeus, there is too much evaporation, and the fluid gets too low to complete the connection and start the bell. Unless the apparatus has been in use some time, this can generally be remedied by adding a tumblerful of water to each jar and gently shakiug the mixture. This is a condition of affairs which is especially indicated when a bell will ring when a button is first pushed in, but ceases almost immediately.

It has been lately shown by Prof. Nichols, the electrician, that in the average incandescent lamp, excepting the latest three-watts-per-candle lamp, the light-giving efficiency is only five per cent of the total energy radiated from the filameut, the remaiuder beiug lost as heat. He has also demoustrated that the superiority of the arc lamp, in the matter of caudle power per horse power, is not nearly so great as has been commonly assumed; so that, although the arc lamp may, when measured in the best and most favorable position, devclop six aud seveu times as much light per horse power as the incandescent—when their mean spherical iutensities are compared—the actual difference otherwise is far less, aud the ratio is reduced to only two to one in favor of the arc lamp. On the other hand, however, arc lamps are usually placed in such a positiou as to bring their best light-giving value into practical effect. In order to avoid the difficulties which have been met with in the method of measurements for the light-giving value of illuminants, Prof. Nichols suggests such a change as will take accouut of the fact above noted, viz., that the candle power of a lamp does not represent its light-giving value, and, iu the case of the incandescent lamp, temperature and area of radiatiug surface should be made account of.

Usually Overstated.

So far from a bullet fired from an Euglish magaziue rifle having an impact weight of several huudred weight, as many seem to believe—one wiseacre states that a half-ounce bullet strikes a blow 500 yards from the muzzle of the rifle equal to about one aud a half tons—it only has au impact of a few pounds weight.

According to W. B. Wallace of the Suffolk Regiment, who seuds to the *Daily Graphic* an interesting calculation in dynamics to show how the force of a Lee-Metford bullet striking the cuirass worn by Dowe is dissipated, the kinetic energy imparted to the cuirass is only equal to four foot-pounds. If a person were to lie on his back, and the cuirass were dropped ou his chest from a height of four inches, it would equal the blow given to Dowe when struck by the bullet ou the cuirass.

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and Sonth America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 22 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Practical Information.

Table of Principal Allyos.

A combination of copper and zinc makes bell metal.
A combination of tin and copper makes bronze metal.
A combination of tin, antimony, copper and bismuth makes britannia metal.
A combination of tin and copper mates cannon metal.
A combination of copper and zinc makes Dutch gold.
A combination of copper, nickel and zinc, with sometimes a little iron and tin, makes German silver.
A combination of gold and copper makes standard gold.
A combination of gold, copper and silver makes old standard gold.
A combination of tin and copper makes gun metal.
A combination of copper and zinc makes mosaic gold.
A combination of lead and a little arsenic makes sheet metal.
A combination of silver and copper makes standard silver.
A combination of tin and lead makes solder.
A combination of lead and antimony makes type metal.
A combination of copper and arsenic makes white copper

Difficult to Get.

The discovery of deposits of platinum in this country would be as welcome as the finding of a diamond mine. At present the metal costs nearly half as much as gold, having risen greatly in price within the last three years. It is absolutely indispensable for many purposes, being non-corrosive and resisting acids.

It is utilized for chemical apparatus, scientific instruments and incandescent lamps. There is some platinum in the beach sands of Oregon, but not enough to pay for mining. Small quantities of it have been discovered recently in the copper mines of Canada, where it occurs in a combination with arsenic.

Two-thirds of the world's supply of platinum comes from two Siberian mines in the Ural mountains. The metal is obtained there as a by-product of gold mining. The mining is done by scooping holes in the ground to a depth of about 15 feet, and then burrowing, rat fashion, in all directions. Twenty-nine hundred cartloads of earth are required to yield 15 pounds of platinum. The biggest nugget ever found was about the size of a tumbler.

G. W. DUN, the naturalist, referring to a probable cause to the extinction of many "night gas lights," says: "The moth miller is causing many deaths, and people would do well to look out for them. They are harmless looking, but very dangerous. San Francisco is, though a large city, full of these moth millers. The average man does not see a moth miller, though it flies before him half a dozen times. He has not trained eyes for such things. The only way he knows the millers have been around is when he discovers his clothes cut to pieces. It is the millers rather than the little gusts of wind that put out the gas. As soon as a moth sees a light it makes for it. Most people on going to bed leave a jet or two burning very low. At the same time the window sash is up or down; therefore, when a miller sees the jet he finds easy access to it. A single flip of his wings is often enough to extinguish it. The result is that the gas quickly fills the room and asphyxiates the sleeper. No wonder that no note is left and no reason can be assigned for the death. It is a mystery for which the moth miller is responsible."

IN 1893 manganese ores were produced in five States—Arkansas, California, Georgia, Tennessee and Virginia. In 1892 three States produced manganese ores—Arkansas, Georgia and Virginia. The Georgia production declined from 826 tons in 1892 to 724 tons in 1893, and the Virginia production declined from 6079 tons in 1892 to 4092 tons in 1893. California and Tennessee produced, respectively, 400 tons and 482 tons in 1893.

Columbian Half Dollars.

Among the subsidiary coin turned into the various Sub-Treasuries of the country appear from time to time Columbian souvenir half dollars. These coins, under the act authorizing their issue, are a legal tender in amounts of $10 or under. They are taken at the Sub-Treasuries, of course, at their designated value only, whereas they cost the careless or forgetful persons who put them into circulation from $1 to $2 apiece. But three of the 50c pieces have been thus presented at the New York Sub-Treasury, and none of the Isabella quarters have made their appearance. The Sub-Treasury in this city has received some of both. There were $2,500,000 of the Columbian half dollars coined, making a total of 5,000,000 pieces. The quarters are of great rarity, but $10,000 worth, or 40,000 pieces, being coined.

The Iron in One's Body.

A lecture, presumably scientific, was delivered in a hall in Philadelphia recently, the lecturer stating that the human body contained enough iron to make a plowshare. There are about 100 grains of iron in the average humau body, and yet so important is this exceedingly small quantity that its diminution is attended with very serious results. The man who thus talks about the quantity of iron in the system probably knows as little about the human body as he does about the weight of a plowshare.

A LARGE, VALUABLE Gold Mining Property FOR SALE CHEAP.
A GRAND OPPORTUNITY NOT EASILY DUPLICATED. Actual value many times the price asked.
Situated in Nevada County, California, and consists of a group of four mines, all strong, heavy veins. Only partially developed. Ore free milling. Over $90,000 past yield of ore from one mine alone.
Must be sold within 30 days to close out an estate. Price, $30,000. Terms, $5000 cash; balance easy installments, or 20 per cent of gross proceeds, to suit purchaser.
Machinery on the ground worth cash payment asked. For prospectus and particulars, please address:
S. B. FOWLER,
Grass Valley.....California.

DIVIDEND NOTICE.
The German Savings and Loan Society,
526 CALIFORNIA STREET.
For the half-year ending June 30, 1894, a dividend has been declared at the rate of five (5) per cent per annum on Term Deposits, and four and one-sixth (4 1-6) per cent per annum on Ordinary Deposits, payable on and after MONDAY, July 2, 1894.

Market Reports.

The Markets.

SAN FRANCISCO, July 12, 1894.

The general demoralization consequent upon the tie-up of the country's business seems not to affect the silver market, which fluctuates between 62 and 63, the causes which lie at the bottom of these low prices transcending in latitude and longitude even the limits of this nation. Copper is still depressed, the price unvarying from the preceding week. During June 725 flasks quicksilver were received here. The receipts for the first six months of '94 were 12,405 flasks; for the corresponding period in '93, 12,575. The exports for the same time in '94 were 8572 flasks, worth $251,794; for the first half of '93, 9259 flasks, worth $377,993.

New York Prices.

NEW YORK, July 12.—Following are the closing prices for the week:

Mining Share Market.

SAN FRANCISCO, July 12, '94.

The tie-up has excluded mining stock buying and selling as completely as any other industry. Prices were fairly steady, but the volume of business was very small. Some Comstock superintendents are here who want to get home, and others are home who want to get here. The railroad paralysis compels a return to primitive means of communication. Nevadans drive by stage and private conveyance via Placerville to Sacramento, and there take boat for this city. At the annual meeting of the Best & Belcher Mining Company 78,076 shares were voted. Directors and officers were elected as follows: George R. Wells, president; Charles H. Fish, vice-president, and E. B. Holmes, H. Zadig and W. R. Sherwood, directors; P. Kervin, superintendent, and M. Jaffee, secretary. At its annual meeting the Company of Associated Stock Brokers of the San Francisco Stock and Exchange Board re-elected the old directors: George C. Hickox, A. W. Foster, J. M. Shotwell, George T. Marye and H. L. Van Wyck.

The Alta assessment delinquent sale has been postponed to July 30, and the Union Consolidated to August 6th.

The ease of Andrew Crawford vs. the Mount Moriah Quartz Mining Co. has been dismissed. The claim was on an alleged agreement for the purchase and sale for $20,000 of quartz locations on Little Wolf creek, Sierra county.

The North Star Mining Company has voted to increase the capital stock of the company from $1,000,000 in 100,000 shares to $2,000,000 in 200,000.

The superintendent of the West Cou. Virginia & California reports his men engaged in easing timbers in the north drift, 1100 level, having been unable to get to the face of west crosscut on account of a heavy flow of hot water, which was encountered on the first. The ground is sufficiently drained to permit work in the face. The west crosscut run from a point 320 feet north of the shaft station is now in a total distance of 978 feet. Face in hard porphyry, carrying seams of quartz.

The following illustrates the changes of the week:

A Smelter in the Kootenay.

Despite the severe setback which silver recently received, it would appear that there are men who still have confidence in the future of at least one section of the British Columbia mining regions. The formation is just announced of a company which proposes to erect aud operate a large smelter in the Kootenay country. A paid-up capital has been subscribed in New Haven, Conn., Minneapolis and Victoria, B. C.; to the amouut of $2,250,000 for the purpose of carryiug ou the enterprise aud the work is already well under way.

The compauy, which will be knowu as the Kootenay Miuing and Smelting Co., has secured a location at Pilot bay, the geographical center of the Kootenay country. At this point the plant will be of easy access alike to the high-grade silver-lead ores of the Slocan and the copper, silver and lead of Ainsworth, Nelsou and vicinity. The plaut will accommodate four stacks of 100 tons capacity each and the works will iuclude a 300-ton sampling plant, a 200-ton concentrator, a refinery capable of treating all the bullion produced, and a fine laboratory and assay office. Seven of the buildiugs have already beeu completed for the works and three others are under way at the present time. Over 200 tons of machinery have beeu received and are being placed while several carloads are on the way. The works will be in operation by the 1st of October with a 100-ton stack for the handliug of silver-lead ores and the others will be added as required.

The promoters of the scheme are busiuess men—E. W. Herrick of Minneapolis is the president of the new company; R. P. Rithet, vice-president; Joshua Davies, E. Crow Baker, W. H. Ellis, W. P. Sayward, W. J. Macaulay, James Hutchesou and Headly Chapman. Andrew B. Hendryx is business manager.

MINING SHAREHOLDERS' DIRECTORY.

Coast Industrial Notes.

—A new dynamo and other machinery has just been added to the Mount Lowe Railroad at a cost of $8000.

—The Colton Cement Works have put on an additional force of men, and expect soon to have 300 at work.

—Over 25,000 feet of insulated copper wire will be used in the electric wiriug of the new French hospital on Point Lobos avenue in this city.

—The steamer Bawnmore has arrived from Peru with 2680 tons crude petroleum for Grace & Co., being her second cargo from the S. A. coast.

—It is thought 40,000,000 pounds of sugar beets will be produced in California this season—Chino district, 17,000,000 pounds; Watsonville district, 19,000,000; Alvarado district, 4,000,000.

—The stockbolders of the Market Street Consolidated Railway Compauy of this city have authorized the issuance of $17,500,000 in bonds to extend the lines and operations of the company.

—The Seattle Canal Company has perfected plans for cutting a caual from the south end of Lake Washington to Elliott bay. The cost will exceed $3,000,000. Work is to begin November 1st.

—A State federation of real estate men has been organized to be in operation by the first of next mouth. The central bureau is to be located in San Francisco, with county and district branches throughout California, wherever people can be found to aid in the scheme.

—The U. S. and Mexican Government have a joint commission journeying down the Colorado from Yuma, the idea being to make a thorough examination and report to their respective Goveruments on the feasibility of dredging the river to its mouth, so that deep water vessels cau go to Yuma.

—Joseph Colby, president of the Puget Sound Reduction Works, has removed to Everett from New York and will assume management of the company's interests at that point and at Monte Cristo. One hundred men are at work rebuilding the tramway from the mines to the concentrator, which was wrecked by suowslides some time ago.

—On the Pacific coast there are 134 salmon canneries, 38 of which are located in Alaska, 39 in British Columbia, 23 in Washington, 24 in Oregon and 9 in California. There are 24 canneries on the Columbia river, equally divided in number between the Washington and Oregon side, and the same number of canning institutions also operate on the Fraser river in British Columbia.

—There is a rapid development going on in canal building in Arizona. The territory will be enriched during the next six years with $8,000,000 in canals alone. The storage reservoir of the South Gila Company is considerably larger than the bay of San Diego. The Verde Company has just let a $2,000,000 contract for its dam and canal. The Colorado Irrigation Company's canal will cost $5,000,000.

—The Colorado River Irrigation Company has concluded arrangements to raise capital for the building of its great canal on the desert, in San Diego county. Gen. L. A. Grant is president of the company and J. C. Beatty vice-president and general manager. They have obtained rights to water of the Colorado river to irrigate thousands of acres on the desert, and many square miles of land have been acquired. Preliminary surveys have been made, and for miles the company will utilize the canals cut by some prehistoric people, which have been found along and below the Mexican line, dug according to engineering rules and conforming to the topography of the country. The project of the present company is on a big scale, and is the greatest engineering and irrigation scheme of the continent, being intended to reclaim over 500,000 acres of land.

Are You Interested in Mines?

There is to-day no mechaniical appliauces in use about a modern stamp mill of such great value in the saving of precious metal in the ore as concentrators, and, such being the case, the iuventive minds of mechanical men have been taxed to improve upon those appliances now in use in the mines throughout the western coast, and elsewhere.

One of the best concentrators of to-day, and which is in general use, is the Frue Ore Coucentrator, or Vanuer. This is one of the oldest machines in the market, over 4000 of them being in actual use at the present time, not only on this coast, and the east, but throughout the entire world.

From time to time valuable and important improvements have been made in the Frue Vanner, thereby greatly increasing the capacity, and adding to its durability. The most uotable among these improvements beiug the Brownell patent or "lip" flauge for rubber belt, whicb doos away with nearly all the straiu and cracking, as in the old style of flange, making the life of the belt more thau double that of other style belts. The lip of flange bending outward causes the flange to flatteu down when going over the large rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain, either at the edge or at the base of flange, as is the case in all belts with a raised edge. This makes the Brownell flange superior to any in the market.

Samples of this new flauge can be seen at the office of the Frue Vanning Machine Co., Jas. S. Brownell Western Agent, 132 Market St., San Francisco, Cal. *

BOOKS ON ASSAYING.

BY C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion. Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

LIGHTNING LARGEST **WELL MACHINERY** Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

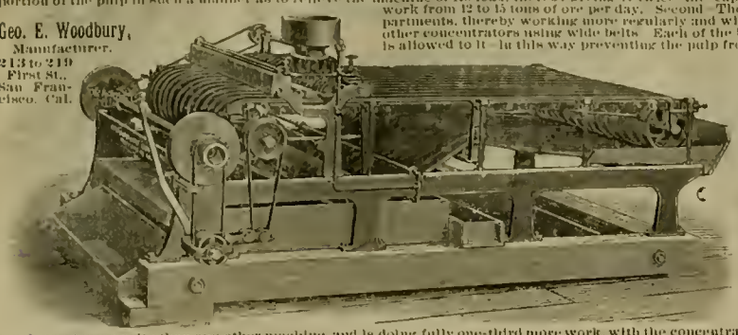
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

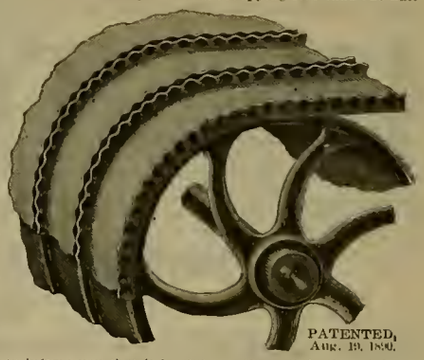
was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer. 213 to 219 First St., San Francisco, Cal.





PATENTED, Aug. 19, 1890.

THE SAN JACINTO ESTATE—Office of the General Manager. Cajalco, Oct. 30, 1891.

GEO. E. WOODBURY, Esq.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here. [COPY.] Yours faithfully, S. HARRIS, Manager.

VOLUME LXIX. Number 3.

SAN FRANCISCO, SATURDAY, JULY 21, 1894.

THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

Gold-Milling at the North Star Mine, Grass Valley, Cal.

(Concluded from last issue.)

Figure 4, on page 38, gives in detail the battery frame in elevation. For the several blue prints, from which these engravings have been made, I am indebted to Mr. R. S. Moore, superintendent of the Risdon Iron Works, San Francisco.

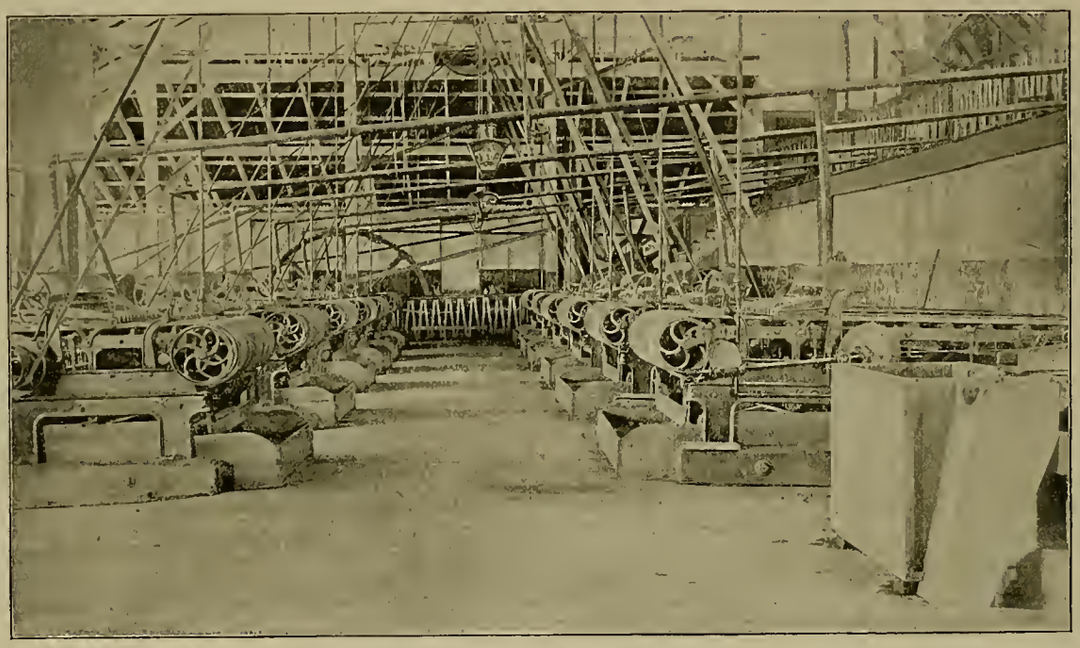
The mill contains 40 stamps, weighing, when newly shod, 875 pounds each. The stamps drop seven inches 86 times per minute. The shoes (steel exclusively used) weigh 159 pounds, and the remaining 716 pounds of the stamp are distributed as follows: Stem, 358 pounds; stamp-head, 228 pounds; tappets, 130 pounds.

The life of a steel shoe averages 130 days, and it crushes during that period 260 tons of ore. The weight of the shoe, when removed, will average about 38 pounds. The very smooth and uniform wear observed on these shoes is due in great measure to the use of cast-iron dies.

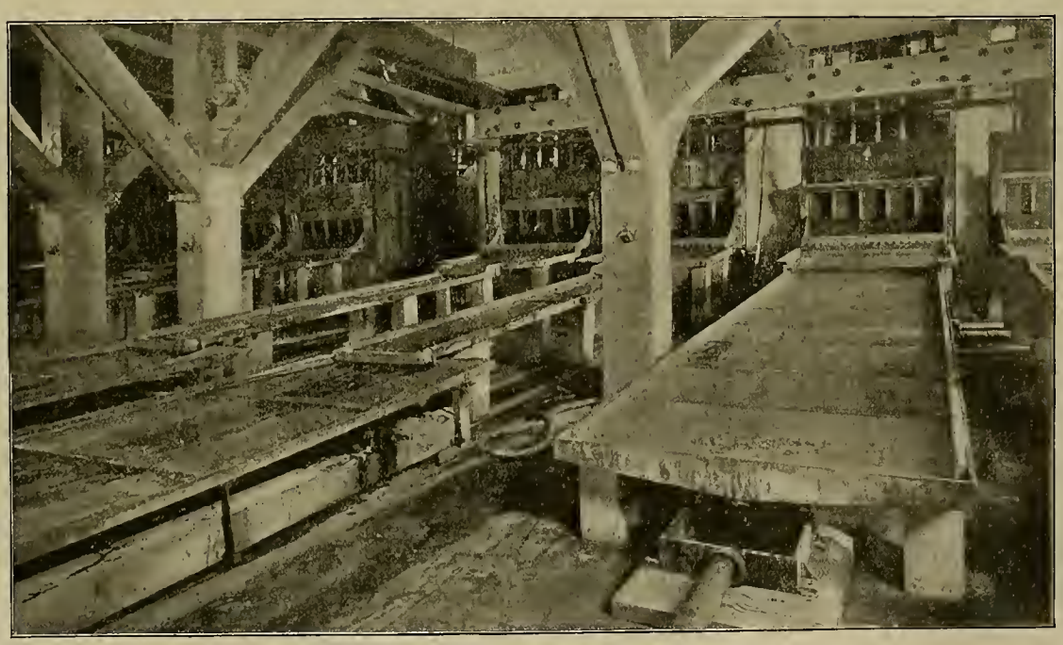
The weight of the die when new is 100 pounds, and it loses during a life of 70 days one-half its original weight. The recent introduction of cast-iron plates two inches thick has increased the life of the die to 80 days, the die, when removed, weighing from 40 to 45 pounds. These plates, two in number to each battery, fit snugly in the mortar, forming a false bottom, upon which the dies are bedded as usual. They serve a double purpose, prolonging the life of the dies and decreasing the height of the discharge, which ranges from an initial of four inches to a maximum of six inches.

Brass wire No. 30 screens and perforated No. 0 tin screens are used exclusively. The latter screen is an experiment, and thus far has given good results. The life of a tin screen is about 30 days; the cost, one-fourth that of wire screens. At the North Star mill, in crushing 113,755¼ tons of ore, the cost for screens has been $0.008 per ton. Dies have cost $0.026 and shoes $0.056 per ton, exclusive of a rebate of 1½ cents per pound on removed shoes and dies.

The recovery of gold is first made in the mortar, where the amalgamation begins. Mercury is fed to the batteries at regular intervals, the amount varying with the grade of the ore crushed. At times, this amount has exceeded one pound per battery, or a flask of 76½ pounds in nine days. Of this amount, however, 35 per cent is recovered at the fortnightly retorting of amalgam. There is, however, a considerable loss of quicksilver, which, in treating 113,955¼ tons of ore, has amounted to $3680.05 or $0.032 per ton. In the interior of the mortar, under the screen-frame, are silver-plated copper plates 4½ inches wide by 52 inches long. These plates, one for each mortar, are bolted to chuck-blocks fitting tightly against the lip of the mortar, as shown in Fig. 5, on page 38, a section of a single-discharge mortar used at this mill. As the pulp is discharged from the mortar through screens, it falls upon an outside battery or splash-plate 18 inches in width, covering the iron mortar-apron, which is bolted to the mortar and forms part of it. The length of this plate is equal to that of the inside plate.



NORTH STAR MILL — CONCENTRATOR-FLOOR.



NORTH STAR MILL — OLD AND NEW APRON-PLATES.

The apron-plate, 48 by 58 inches, lies below the splash-plate, tapering to 24 inches and connecting with the three sluice-plates which cover the sluice 12 feet long and 24 inches wide. From the sluice, the pulp passes over shaking-tables, which have a plated surface of 10 feet by 48 inches, made up of two plates 48 by 36 inches and two smaller ones, each 48 by 24 inches.

The grades of the above plates are as follows: Battery and apron-plates, 1½ inches to the foot; sluice-plates, 1¼ inches to the foot; shaking-tables, 1 1/16 inches to the foot. The natural tendency of the narrow sluice-plates to "scour" has always been objectionable, and in fitting the more recently erected batteries with a line of plates, the width of the sluice has been doubled. These plates, eight in number, are placed side by side, and overlap slightly, aggregating 15¾ feet by 4 feet wide, the total actual plate-surface being equal to that of the narrow sluice-

Now that Utah is to be a State, it is in order to do likewise for Arizona.

After a blockade of seventeen days it is a pleasure to once more get into communication with friends and patrons near and far by mail.

Lieut. H. W. Turner, of the U. S. Geological Survey, is in Butte county securing material for a map of the Sierras in that part of the State, which will be of value to every resident of northeastern California.

In the recent tremendous flood in the northwest all the snow didn't melt. The unusual snowfall is expected to insure a good placer mining season in British Columbia, Idaho, Washington and Montana, with a corresponding increase in the gold yield.

Southern Oregon shows considerable present activity in mining, more prospecting now being done in that section than ever before. It is calculated that in the Medford district alone, over $600,000 in gold was taken out last year.

Colorado is discovering that not every man who writes "M. E." after his name is entitled to the honorable appellation of "Mining Engineer." Fortunately for the best interests of mining such quacks and empirics in the metallurgical field are quickly detected and turned down.

The words "drift" and "crosscut" are not interchangeable, though one or two of our contemporaries by their use would seem to think so. In this connection it is to be borne in mind that a "drift" follows the vein, a "crosscut" intersects it, cutting across it at an angle more or less acute.

It is reported that last Tuesday the owners of the Utica-Stickles mine were offered and refused $6,000,000 for their mine. That property is but an example of hundreds of others throughout California that await development. Less than two years ago it could have been secured for less than $20,000.

At Mercur, Utah, the Marion Company has quit the process formerly in use, and is retorting the gold product of their mill. The local papers think the Mercur will shortly do the same. Formerly shipment was made to Omaha, but it is now about decided to complete on the spot the entire process of reducing the sulphides to bullion.

During the height of the strike A. N. Towne telegraphed to C. F. McGlashan of Truckee to ask if in his judgment it would be safe to try to run a train through Truckee, protected by Deputy Marshals. Mc wired back that there were not enough Deputy Marshals in the United States to run a train through Truckee, but he changed his mind later on.

As compared with ten years or more ago there is far less money wasted in mining schemes than formerly. Intelligent action and investigation now save many costly blunders, and even where new conditions prevail information is obtainable that will prevent financial disaster. It is largely a man's own fault if he loses money in mining projects nowadays. In such case it is either a willful gamble or an investment made on insufficient or unreliable statements, as often occurs in any other line of business.

"Why," it is asked, "is it that Con. Cal. & Va. is quoted so much less than it was ninety days ago, when, according to the official showing, it is really more valuable than three months ago?" To give a complete answer would transcend ordinary newspaper space. Confidence in the management of a mine has often as much to do with the figure at which its stock is quoted as the value of the mine itself. Very often the price of the stock of even a dividend paying mine is an exact reflex of the mine's management.

Money is going begging for investment in this city at from four to six per cent. Meanwhile, in a thousand promising localities throughout the mining area of the State, are good mines that, developed, would yield a hundred times the investment. Were more men able to divest their minds of the old superstition that there is a gamble, an uncertainty and universal risk about mining investments, it would be better for the State. Mining is now as legitimate and certain a form of investment to the intelligent man of means as any other business.

The Senate has passed the House bill suspending for the year 1894 the provisions of the Revised Statutes of the U. S., which require that $100 worth per annum of labor shall be performed or improvements made on each located mining claim during the term before the issue of patents, being a repetition of the bill passed on the 3d of Nov., '93, regarding similar work for '93. By filing before Dec. 31st, 1894, a notice that the claimant intends in good faith to hold and work his claim, he is exempted from the usual requirements for this year.

During the present labor troubles president Debs in Chicago and chairman Knox in Sacramento, the labor leaders in the strife, issued sundry peace proclamations which read very well. It has been proved at Debs' examination in Chicago that he sent private telegrams advising his adherents to save their money and buy guns. The Willows *Journal* says:

On July 7, 1894, at 12 o'clock M., a party in this town received the following telegram from Sacramento, signed by Mr. Knox of the American Railway Union:

We need financial assistance, but armed assistance would be more acceptable.

It must not be supposed that because the mining stock market is dull the mines are lifeless, too. Reference to our weekly summary of mining news condensed from the local press of the State and coast shows that the utmost activity prevails, new mining communities are clustering round recent discoveries, old mines are being put in process of proper development, steady producers are yielding regular dividends, and that, too, with very little fuss being made about it. No industry has suffered so little from the year's depression; none is in better shape or brighter promise for the general improvement that so surely awaits us.

It is a pleasure to know that by skill the builders of the Government vessels are even exceeding the rigid requirements of the Government in the matter of speed. Recently the Union Iron Works of this city earned a $300,000 bonus by exceeding the speed requirement, on the basis of $50,000 for each quarter knot over the maximum. Now the builders of the Minneapolis have earned $414,600 in premiums, by succeeding in developing a speed of 23.07 knots on her trial trip—21 knots being required. That is equivalent to about twenty-six and a half miles an hour, which is considerably better time than some of the railways have been making lately.

Drift Mining in California.

The western slope of the Sierra Nevadas in this State, from Mariposa to Siskiyou, contains the great area in which drift mining in California is practicable and profitable. In Nevada, Placer and Sierra counties is found the richest ground, though Plumas, Butte, El Dorado, Amador, Calaveras and Tuolumne counties have many important drift mines. There is almost a uniform geological character to this entire district, the main axis of the great mountain range from its summit thirty miles westward being granite. Westward to the Sacramento and upper San Joaquin valleys occur almost uninterruptedly metamorphic stratified rock, slate and limestone forming the largest part. Research indicates that the prehistoric rivers that ran through this region were wide and deep but comparatively short. Occasionally are found two lines of those ancient channels bisecting each other at almost right angles, indicating their distinct and separate formation in periods of time boundless by ordinary computation. In those old days when the world was young, into these old channels filling up with bowlders, gravel and sand, was also washed gold from the quartz veins. The close of this Pliocene period eons of ages ago was marked by a lava flow covering and sealing that auriferous deposit in some cases a thousand feet deep. In the present geologic period the streams now on the surface, trending more straightly westward than their buried brothers, have eroded through this lava, through the ancient debris, and in many cases through the slate. A part of the gold thus brought to light by Nature's slow processes has been secured by man during the past forty-five years. Its source and fountain seat is only to be unlocked by drift mining. Drift mining may be considered as a branch of placer mining. It was in the early days of placer mining that the origin of the placers was discovered. The miners of forty years ago, as their placer claims were being worked out, naturally looked eastward and upward to the hills, and working higher came to places beyond which no surface trace of gold was found, the gravel "vein" running into the mountain. In tunneling on the bedrock they found it pitched downward as it went into the mountain, the result being that they were ordinarily drowned out. This was the incipiency of drift mining, the plan adopted being running tunnels on an up grade from the lowest practical point, thus draining the drift and making it easier to move the gravel.

There is no field more promising of returns than the development of drift mines. The preliminary cost of such development can be greatly lessened by judicious expenditure at the start in securing intelligent survey of the ground proposed to be worked. Proper platting of the probable course and grade of the gravel sought by a competent engineer, while not infallible is far preferable to hap-hazard prospecting which often uses up considerable money with unsatisfactory result. Prospecting, of course is necessary, but before much money is spent the services of a good mining engineer will be found to be a matter of practical economy. A prospecting shaft is rarely necessary where the conformation of the surface will not permit tunnel or drift prospecting from the face of the mountain, that depending greatly on the thickness of the overlying strata of earth and rock. The definite and regular work on a drift mine by shaft is a costly process, tunneling on an easy grade being in nine cases out of ten the cheapest and most satisfactory way. In this branch of mining the risks and expense are counted small when the yield is so great as in numerous familiar instances in California's mining history, where $10,000 was got from one carload of gravel, or where over $750,000 was secured from half an acre of rich ground.

It is probably no exaggeration of facts to say that for every dollar taken from the ancient river channels of California there remains ten to be added to the world's wealth by drift mining.

It may be considered as the unwritten law that if A and B agree to supply C with the needful supplies for prospecting, etc., anything discovered to be for the joint benefit of the three, any failure on the part of A and B to keep their part of the agreement absolves C from all claims by them, and he can discover and locate claims for himself, regardless of the contract.

Concentrates.

ALASKANS propose to establish a mining bureau.

DURING June $71,409.50 was paid to Comstock employes.

THE Mount Moriah mine, in Sierra county, is shut down for the present.

GOOD reports come from the Camp Floyd, Utah district, as a gold producer.

THE *Montana Mining Age* is a year old, and a good healthy child of its age.

THE Stewart mine at Bingham, Utah, is reported producing $25,000 per month in gold.

The Anaconda, Montana, *Review* announces that hereafter it will be "the A. R. U. organ."

THE New London mine near Plymouth, Amador Co., has been sold to a New York company.

A 250-foot tunnel is being run in the Crandall mine at Ophir, recently bonded by White and Thorpe.

THE Wasatch mine has been sold at Marshall's sale to the Ontario Company for $210,000.

A RECENT crushing of 99 loads of quartz from the Wisconsin mine, Grass Valley district, yielded over $2500.

THE Pioche, Nev., *Lode* says the last cleanup bar of gold bullion from the Condor mill is valued at $20,000.

THE total value of the gold, silver, coal and other minerals raised in New South Wales during 1893 was £104,280,711.

SEVERAL prospectors are reported to have been murdered by unmarauding Indians in the regions west of the Arrow lakes.

TWENTY-SIX men are employed at the Gwin mine, getting ready for the machinery which has been delayed by the tie-up.

THE mill at Bullionville, Nev., has been leased to Walter Reeder. Chloridizing and amalgamating tailings will be continued.

THE new canal near Colfax carries 1200 inches of water. The South Yuba Company is laying a system of water-works at Rocklin.

THE value of antimony produced in New South Wales during 1893 was £25,092, an increase of £10,412 compared with the previous year.

THE mines of the White Hills Company, near Kingman, Arizona, have been closed down. The mill will continue working till August 1st.

AT the Blue Lead gravel mine, at Relief Hill, the tunnel has been extended 200 feet. It is run by contract, and is now in over 2000 feet.

THE diamond fields at Bingera, in New South Wales, yielded during 1893, 15,000 carats, valued at £15,375, or an average of 20s. 6d. per carat.

THE DeLamar Gold Mining Company at Ferguson, Nev., have an improved artesian boring machine, with a boring capacity of 3000 feet.

THE Fisher Maiden lode, south of Four Mile in the Slocan, has been traced for three miles, making it the biggest ledge known in the district.

THE Ontario tunnel in Utah is a rival of the Sutro tunnel in Nevada. It is now in 15,000 feet, and has 560 feet more to go to reach its terminus.

THE old, old question of dip and apex is being argued in a $200,000 case at Provo, Utah, between the American Eagle Mining Co. and V. F. Clays.

THE Baker City, Or., *Democrat* says that the ore on the dump at the Emma mine, as experted by reliable mining men, will go from $100 to $300 to the ton.

E. H. COX has bought the Santa Rosa and the San Diego mines on Bear creek, Mariposa county, and has contracted for a tunnel 500 feet long to be run on them.

HYDRAULIC operations at the North Star have ceased. The Calaveras *Chronicle* is informed that it is the intention to work the mine by the drift process in future.

THE Vanderbilt *Shaft* says: "There has been little of special interest among the mines and prospects this week. The only question that interests us particularly is, 'How long will the grub hold out?'"

THE editor of the Tuolumne *Independent* had the pleasure last week of holding, for a few moments, a hundred ounce brick of gold, recently taken out of the Fairview pocket mine, situated north of Sonora.

REPORTS from Northern Idaho say silver properties are being abandoned on all sides, and the owners are turning their attention to gold. Everybody is looking for gold-bearing quartz and placer ground.

THE Gover mine has been started up. Alvinza Hayward, Superintendent Lane of the Utica mine and S. W. Cross, administrator of the Hobart estate, have bonded it, and expect to run the mine on a large scale.

THE Dardanelles mine, at Forest Hill, Cal., has closed down. Liens have been filed against the property for wages claimed. H. F. Calmberg, the former superintendent, is keeper under orders of the court.

THE Basin and Bay State Mining Co. has incorporated at Basin, Montana, with a paid up capital stock of $3,000,000. They own and will operate the Katie mine. A lawsuit with the Hope Company is on the program.

GILPIN COUNTY, COL., gold buyers, eager for traffic, are reported out and injured, paying $20.50 an ounce for placer gold that runs about $17 at the Mint, repeating the same experience of others at Oro Fino and elsewhere.

THE Rose Kimberly Mining Company has incorporated in San Francisco with a capital of $1,000,000, of which $2500 has been subscribed. Directors—George M. Spencer, J. H. L. Tuck, F. E. Montverde, A. J. Dewey, G. E. Beach.

WHILE cleaning the bedrock ditch and flume at the Hupp & McMurry mine last week, the Trinity *Journal* says three twenty-dollar gold pieces bearing date of 1856 were found. they had probably been buried by some miner in early days.

THE *Enterprise* says the old Ophir mill is about to be cleaned up. It will take several months to complete the work, and the men who have the contract will probably make a neat little sum for their labor, as the leakage of quicksilver and amalgam for years past has been left undisturbed in the ground under the mill. Some pretty rich ore from the Comstock was worked in this mill in years gone by, and a little bonanza is likely to be run into.

MALTMAN & TOMPSON of Nevada City are reported to have bought the sulphurets at the Pioneer quartz mine near Damascus. The nearest railway station is Towles, a distance of eight miles. The ore must be packed to that point by a mule train.

CONGRESSMAN CAMINETTI expects to get a bill through this session ordaining that in case of a mining entry being contested the Government Land Office shall assume the lands inclosed in a mineral belt are mineral lands till the contrary is proved.

THE railroad tie-up is productive of a good many items like the following from the Nevada *Transcript*, which sound singular in California in 1894: John F. Kidder left this afternoon, with Ed. Fitzsimmons as driver, for Sacramento, and will take the boat to-morrow for the bay.

THE Niagonda Gold Mining Co. has incorporated in this city with a capital stock of $250,000, of which about $1000 is subscribed. S. L. Lent, Abner Gorrish, J. C. Steele, E. W. Wooster, W. E. Bayer, J. A. Stark and W. M. English are the incorporators.

AT Cal. Clarke's mine near Nevada City they have set up a light hoisting rig, with a twelve-horse power engine, which serves for pumping and hoisting. A timbered incline pitches under the old shaft where twenty years ago ore was taken out going $110 to the ton.

A CHARLESTON correspondent of the Amador *Record* says a Government Debris Commissioner came up to Volcano recently and enjoined all the hydraulic miners in the vicinity, thereby throwing them out of positions whereby they were able to earn their daily bread.

THE Government engineers of the California Debris Commission have recommended to Congress the building of a series of dams and locks in the Yuba, Bear and American, the whole of which will cost about $1,000,000. The amount called for at De Guerre Point is $300,000.

THE *New Northwest* says there is considerable excitement over placer mining at Yogo. Bars that have been untouched for years are being sluiced off and money cleaned up daily. Quartz mining has been practically suspended and the attention of all is drawn to the placers.

FOR the fiscal year ending June 30, 1893, the value of deposits at the Denver assay office or branch mint, mostly gold, reached a total of $1,409,838.87. For the year ending June 30, 1894, the total was $3,240,624.45, of which $19,520.89 was silver, showing a gain in favor of the last fiscal year of $1,830,787.58—129 per cent.

THE *Record* says the new mining camp, located on Silver creek in Gilpin county, Colo., between Central City and Pine creek, is springing into favor with prospectors and miners very rapidly. Pay dirt is found at the surface; and though not of high grade, it is sufficiently rich to warrant systematic exploitation work.

G. L. SHELDON, superintendent of the Yellow Jacket mine, Ketchum, Idaho, says his company has placed orders for a 40-stamp mill, and as the machinery will have to be packed on mules for a distance of 50 miles, the mill will be built to conform to that animal's carrying capacity, and no piece will weigh over 350 pounds.

THE Montana Mining Company reports that there were 9738 ounces of gold and 95,855 ounces of silver produced in the six months ending with December, 1893, and figures the actual cost of producing the silver at 61.8 cents per ounce, which sold at 71.5 cents. At ruling figures there is no profit in the business so far as that mine is concerned.

ABOUT 1500 men are employed at the mine of the Anaconda Copper Company in Montana, and 1100 at the works. It is believed that, were no further developments made, there is enough ore now in sight to keep the smelters going for the remainder of this century. A slight rise in copper would enable the company to declare more good dividends for a number of years.

THE Bi-Metallic Company at Phillipsburg, Montana, is preparing to work the large pile of tailings accumulated at its mill. They have been assayed every 24 square feet, and upon careful investigation the company considers it a very profitable investment. The *Times* thinks should this venture prove profitable, it will keep the mill running for 18 months and produce $3,000,000.

SOME time ago, says the Kingman, Arizona, *Miner*, a cave in the Diamond Joe mine crushed the life out of a Mexican miner. An examination of the caved ground has revealed the presence of another ledge in the hanging wall that is said to be far richer than the vein in the old workings. The new discovery will be worked as soon as the ground in that vicinity is properly timbered.

THE number of men now employed at the Cripple Creek mines, not counting men who are working for themselves, count up 1236, which probably exceeds the number at work in any other district in the State. The heaviest force, 90 men, is employed at the Pike's Peak. The Cripple Creek *Journal* says that from 1500 to 1800 men are engaged in prospecting, leasing, ore hauling and milling.

THOS. TRESIZE wants the Blythe estate to pay him $14,089.29. The dead millionaire owned the Blue Jacket mine, in Elko county, Nevada, and Tresize says he was employed as keeper and watchman from October 18, 1879, to July 18, 1892, at $4 a day. He was paid $4,370.71 and wants $14,089.29 more for the 4615 days. From present reported value of the property, the estate may conclude to make him a present of the mine and call it square.

AT Clarke's Calusa, Montana, it is asserted that one of the shift bosses had been selling positions for $20 each, from which he has saved a comfortable stake. One of the men who bought a job was not giving satisfaction and was fired, when he made a big kick for the return of the $20. The management bearing of the marketable price of jobs and of their disposal at once dispensed with the underground employment agency by discharging the gentleman.

THE Morongo King Mining Company, of San Bernardino county, has bonded its property to a Chicago syndicate for ninety days for $325,000. The Chicago parties are to have possession of the property upon the payment down at any time within the ninety days of one-half the purchase price. The balance is to be paid in four equal payments in three, six, nine and twelve months. The purchasers are to turn over one-half of the gross output of the mine each month to apply on the deferred payments and retain one-half and pay all operating expenses. Until the payment of one-half the purchase price, the present owners will continue to operate the property for their own profit.

THE Calaveras *Chronicle* reports a rich pocket struck in the Moser mine, 155 feet from the surface. The extent of the pocket is not known, as only the ore was taken out that was encountered in sinking the shaft. There is a 62-pound piece of the ore now on exhibition in this place that experts say will yield $1000, while they have at the mine a number of smaller specimens that are equally as rich. This is the second rich spot that has been encountered since the work of development was commenced by the Roanoke Company, while all the rock taken out and put through the mill has a splendid average. Everything points to a second Utica.

Clipped and Condensed.

THE attendance at the San Francisco fair aggregated 2,300,000.

THE House and Senate are so far unable to agree on the tariff bill.

GREAT quantities of counterfeit silver coin are being circulated in San Francisco.

OVER 1,000,000 letters, besides tons of other mail matter, were received at the San Francisco postoffice last Sunday and Monday.

On Saturday Prest. Debs of the A. R. U. submitted a proposition for peace to the Chicago Board of Railway Managers, asking that all strikers unconvicted of crime be taken back to work without prejudice, to be recognized as individuals, irrespective of any organization. The proposition was rejected. The federated trades decided not to call a general walk-out. The announcement wired to this coast that the strike was off was denied. Two more men were shot by the regular troops at Sacramento, one fatally. At Los Angeles the strike was virtually over; in Oakland local trains resumed. Outside the State there was a general resumption of business. Sunday and Monday there were a few conflicts, the trend of events showing that the strike was virtually over. In Congress by a vote of 125 to 27 the President was endorsed in his action; Governors of States generally commended his two proclamations. At Los Angeles a bill in equity was filed under direction of deputy Attorney-General Denis against the Southern Pacific in the United States Circuit Court, asking that the combination of other corporations with that company be dissolved, alleging that the present combination of thirty-five railway companies in this State is a conspiracy to retard and restrict commerce. If the Government wins, it means that the Central Pacific of California, the Southern Pacific of Arizona and of New Mexico, the Santa Monica branch, the Long Beach branch, and in fact all the lines which go to make up the Southern Pacific system will be separated and operated by their own set of officers. Olney says the Los Angeles U. S. official has exceeded his instructions in the matter. At Sacramento Knox and Worden were arrested charged with murder and sent to the Yolo county jail. At Chicago, on Tuesday, Debs and associates refused proffered bail and were taken to jail. Throughout the Union there were various railway accidents caused by the strike and several collisions between those who said the trains should run and those who said they shouldn't, none resulting fatally, the principal battles being in Pennsylvania and Indiana. In Chicago, the storm center of it all, trains were running and general business went on. Near Missoula, Montana, a Northern Pacific engine was wrecked by twenty pounds of dynamite exploding on the track and fired with a railroad torpedo. U. S. regulars were started from Omaha to Butte; at Sacramento, General Superintendent Fillmore of the Southern Pacific Railway met the mediation committee of the A. R. U. and offered to take all the strikers back in the company's employ if the movement of Pullman cars was not interfered with; at the subsequent meeting the strikers refused to discuss the proposition. In the southern part of the State all trains were running regularly. Train service to and from Oakland was resumed, an attempt being made to blow up one local train in Oakland resulting in temporarily disabling the engine. On Wednesday, from his jail, Debs ordered a tie-up in the Chicago stock yards which was only partially observed, the chief result being incendiarism and general lawlessness. Some of the Pullman strikers returned to work. At Sacramento and all other points in this State trains moved freely. Throughout the Northwest everything was reported quiet. On Friday T. J. Roberts, who represents the A. R. U. in this section, denied the rumor that president Debs had declared the strike off.

Personal.

JOHN ST. CHARLES is the new foreman of the Tennessee mine, near Kingman, Arizona.

C. HEGGARTY of Moore's Flat has some fine specimens of quartz gold now on exhibition.

D. A. MACDONALD is now superintending the Pactolian mine at Hurleton, Butte county.

CHARLES E. UREN, county surveyor of Nevada county, is making a survey of the South Spring Hill mine.

MR. ALFRED JAMES of Glasgow, Scotland, representing the Cassel Gold Extracting Co., is visiting this State.

L. P. GOLDSTONE has resigned the superintendency of the Osborn Hill mine, and will in future devote his attention to the Merrimac.

CAPT. RODDA, former superintendent of the Phœnix mine and mill at Hurleton, now has charge of the Banner mine and mill, near Oregon City, Butte county.

PATRICK KANE, for many years superintendent of the Anaconda and St. Lawrence mines at Butte, at what is believed to be the highest salary of any mining superintendent in the country, has resigned on account of failing health.

CAPT. JOHN CARTER, for many years the foreman of the Idaho mine, and subsequently the boss timberman for the Maryland mine at Grass Valley, has resigned his position, having some mining ventures of his own which claim his attention.

Notes on the Gold Ores of California.

H. W. Turner in the *American Journal of Science*, June, 1894.

As is well known, gold occurs chiefly in quartz veins and these in California have been found to be the largest and richest in the slate series of the Sierra Nevada, but gold occurs in a great variety of rocks and associated with very different minerals.

The occurrences will be grouped geographically.

Veins in the Auriferous Slate Series.—Most of the richest gold mines of California occur in the auriferous slates, and in the associated greenstone slates which are, to a considerable extent, metamorphie forms of diabases and porphyrites. The richest single belt of mines is that along the mother lode, which consists of a series of quartz veins chiefly in a belt of elay slates of Jnrassic age, which are designated on the maps of the United States Geological Survey as the "Mariposa slates." The quartz veins are not, however, entirely in these clay slates. In the southern part of Calaveras county and in part of Tuolumne county, the lode lies to the east of this clay slate helt, chiefly in amphiholite-schists. At many points, as at Carson hill in Calaveras county and at Qnartz monntain in Tuolumne county, the quartz masses are very large. At other points the quartz occurs in little veins and stringers, through a mineralized zone of the black slate, which then forms part of the vein. In some snch occurrences the iron sulphurets containing gold are found both in the slate and in the quartz, and all the material is treated as ore.

Accompanying the mother lode quartz veins at many points is a green micaceons mineral, containing chromium and called mariposite by Silliman, who states that, so far as he observed, this mineral accompanied the quartz veins only in the neighborhood of magnesian and chloritic rocks.

Prof. Silliman also states that the white magnesian mineral associated with the mariposite is ankerite. Other minerals fouud by the same author along the mother lode are ordinary iron and copper sulphides, antimonial copper sulphides, antimonial lead sulphides, and various tellnrides. Prof. Silliman also identified somewhat doubtfully tetrahedrite or gray copper ore at the Rawhide mine in Tuolumne county.

Prof. F. A. Genth states that pctzite, telluride of gold and silver, calaverite, telluride of gold; altaite, telluride of lead, aud melonite, tclluride of nickel, occnr at various mines of the mother lode in the area of the Stanislaus drainage.

Prof. W. P. Blake states that blende and tetrahedrite are found at Carson hill, and in the Pine Tree mine in Mariposa county. The latter mine directly adjoins the Josephine.

Associated with mariposite at the Josephine mine in Mariposa connty, and at Qnartz momtain in Tuolumne county, is a white mineral which at some points appears to form veins in the mariposite. This is probably the mineral called ankerite by Silliman. An examination of this material by Dr. Hillebrand shows that it is ordinary dolomite mixed with quartz and not ankerite. In the Josephine mine erythrite, a dydrous arsenate of cobalt, forms on surfaces and in seams of the rock adjoining the vein.

In addition to the ordinary iron sulphurets, the writer has observed in the mother-lode ores in Amador county, galena, bleude, and arsenical sulphurets in small amounts. As a general rnle the ore of the large mines of the mother lode shows no free gold and only iron sulphurets. Specimens showing free gold and other than iron sulphides are not abnndant. All of the mother-lode ores would be called free milling.

In the Paleozoic schists to the east of the mother lode there are numerous gold veins which have been worked with varying success. One of the most profitable of this group of miues is the Sheep Ranch mine of Calaveras county. The conntry rock of this mine is a mica-schist. The mines about Summersville in Tuolumne county are also in mica-schist. In these mines likewise the snlphurets do not exist as a rule in large amount and the ores may he classed as free milling. One of the most interesting of the mines of this group is the Blue Wiug vein of the Willard Mining Company, north of Murphy's, Calaveras county. Here in limestone is a quartz vein which in places is accompanied by brown-vein jasper. In the Blue Wing vein are found the snlphides of mercury, antimony and lead. Bird's-eye porphyry, in this case probably an altered diorite, cuts the limestone in dikes. In the highly altered slates aud ernptive rocks to the west of Blue mountain in Calaveras county are a group of mines, the ores of which are very basic. Sulphides containing lead, silver, zinc, arsenic and iron are fouud in the ore. At the Bonanza minc at Sonora, in Tuolumne county, the ore occurs in pockets along a diorite dike in the slates. Large masses of free gold with tellurides oceur here and iron and copper snlphides.

At the Ilex mine in Calaveras county, in Paleozoic mica-chlorite-schist, there is a large qnartz vein having a eonrse N. 80 deg. E. Tetrahedrite and snlphides of lead, zinc and copper, as well as free gold, are found sparingly in the ore.

Forming the crest of the Sierra Nevada to the east of Yosemite valley is a belt of schists of unknowu age. Mt. Dana and Mt. Lyell are culminating points of this area of schists, which extends at least 12 miles northwest of Mt. Dana, and, judging from the reports of the State Mineralogist, at least as far south as the Minarets. This schist belt contains deposits of hase ores at numerous points. Specimens obtained by the writer from the Tioga district, to the northwest of Mt. Dana, and from Mono pass, show that the bulk of the ores are very rich in sulphides and would probably be difficult of reduction. These ores contain gold and silver, cobaltite, and sulphides of antimony, lead, zinc, copper and iron. One specimen of quartz from the Tioga mine shows a notable quantity of pyrrhotite.

The report of Mr. E. B. Preston on the silver ores of the Minarets miuing district indicates that the ores are very similar to those above described.

At Mineral King, abont 15 miles southwest of Mt. Whitney, is a hody of Triassic schists enelosed in the granite and containing some gold-qnartz veins. At the npper workings of the Empire mine there is a small quartz vein in crystalline limestone.

Blende and galena occur in the limestone and blende in the quartz. The mines at Mineral King have not proved profitahle, hut the district ahout Tioga and Lundy is a promising one.

Veins in the Granite.—The greater portion of the higher part of the Sierra Nevada and nearly the entire mass of it to the south of Mariposa county is composed of granite. In this large granite area very few auriferous quartz veins have been found. In many of the smaller areas, however, entirely or partly enclosed in the auriferous slate series, there are numerous veins frequently containing ahnndant gold. Two of these enclosed granite areas have been extensively exploited, that about West Point in Calaveras county and ahont Soulshyville in Tehama county.

In a general way the ores of the granite districts are very hase, and need chlorination to ohtain the gold, but this rule is by no means universal.

The ores of the mines of the Soulshyville district in many cases contain a galena-like mineral which gives blowpipe reactions for lead and antimony. Copper and iron sulphurets, magnetic iron pyrite or pyrrhotite, and blende are ahnndant. The vein of the Black Oak quartz mine is accompanied by a dark, fine-grained, slaty rock called "slate" by the miners. This in thin section is seen to contain a large amount of fibrous green hornhlende in ragged prisms lying at all angles and in radiating tufts, and is presumably an altered dike rock, perhaps a fiue-grained diorite. There is also a fine-grained dike (?) rock next to the vein of the Platt and Gilsen mine, which contains a good deal of a brownish mica, specks of iron bisulphide and cblorite in minute veins. This rock is also called "slate" by the miners. The ore of the Hyde mine, which is also in granite in the Soulsbyville district, is free milling. It contains the same sulphurets as the other mines above mentioned, but in smaller amount.

In the West Point mining district the orc contains abundant ordinary iron aud copper sulphides and magnetic iron pyrite or pyrrhotite. Cutting the vein of the Lockwood mine are dikes of a fine-grained diorite of the camptonite series. The vein was said to have been richer where cut hy these dikes.

To the north of Merrimac, in Butte county, similar dikes accompany some of the gold-qnartz veins in the grauitc.

Gold in Albite.—As is well known, free gold usually occurs associated with quartz as a gangue. Instauces are on record, however, of its occurrence in various materials, as talc, calcite, etc. Reeently a series of specimens was sent to the writer by Mr. Leo Von Rosenberg of New York City, from the Shaw mine in El Dorado county, about four miles southwest of Placerville. This deposit occurs in clay sheets associated with a dike or dikes of a feldspathic rock, which appears to he devoid of bisilicates. Judging from the specimens forwarded, the dike rock is more or less decomposed, and is at some points replaced by secondary white feldspar, which at other points cuts the dike rock in little seams. This feldspar is well crystallized, and with the aid of a lens, striations may be noted on the crystals. In thin section these feldspars are seen to he twinned polysynthetically, with extinctious proper to albite, aud a partial chemical analysis by Dr. Hillebrand of the U. S. Geological Snrvey shows that it contains soda, no lime, and abont 19 per cent of alumina. It is therefore albite. In two specimens of this crystallized albite there is free gold. Another interesting specimen is of a dark, fine-grained rock which appears to be an aphantic form of the dike rock, in a seam of which free gold with a little calcite has been deposited.

The following is a partial analysis by George Steiger of the feldspar of the grayish-greeu dike rock forming part of the Shaw mine lode:

(No. 452, Sierra Nevada collection.)

Alumina	about 20.00
Lime	.49
Potassa	1.15
Soda	8.72

This would indicate that the feldspar of the dike rock is also albite, although not so pure as the seeondary albite that oceurs in the veins cutting the dike rock.

The feldspathie lode of the Shaw mine is cut by little veins of quartz, but judging from the specimens sent, these are not very ahundant and do not seem to he connected with the deposition of the gold.

The quartz veins cut the veins of secondary albite, showing that they were formed later than the albite. In one specimen there seemed to be an intermingling of quartz aud albite, pointing to contemporaneons deposition. But in thin section the idiomorphic albite crystals were plainly seen to he euclosed in the quartz, as if there had been a little fissure, the walls of which were coated with albite crystals and the open spaces in the middle hetween the albite crystals later filled in with quartz. All of the material of the lode, except perhaps the quartz, contains iron disnlphide scattered through it in minute cubes, and calcite in little rhomhs and partieles.

Oro Fino Gold Mine.—One and a half miles northeast of Mt. Aigare, in El Dorado county, on the west side of Big Canyon creek, is a dike of rock ahout 1500 feet long, with a nearly north and south strike, but curving to the southwest at the south end. This dike is much broken up, and recemented into a breccia. One of the specimens of the dike, collected there by the writer in 1889, is a quartz-diorite, containing specks of iron disulphide and calcite; another specimen whieh seemed to grade over into the diorite is composed of a plagioclase feldspar, prohahly albite, calcite and grains of iron disnlphide, and strongly resembles in thin section the vein material of the Shaw mine. This last specimen has a brecciated strncture. It is auriferons and is the ore of the mine known as the Oro Fino gold mine. The country rock of the mine is elay slate, the same belt as at the Shaw mine, and is prohably Carboniferous in age.

The gold deposits of both the Shaw and the Oro Fino mines are of snch an unusnal uature as to deserve further investigation.

Petre's River Mine.—One mile northwest of the town of Mokelumne Hill, in Calaveras county, on the north bank of the Mokelumne river, is a quartz mine, owned by Mr. R. W. Petre. There are here two quartz veins which have a northwesterly strike and dip southwesterly abont 80 degrees. The veins are very irregnlar in width, opening out into lens-shaped bodies and quickly pinching ont again. Mr. Petre stated that one of these lenses contained $10,000 in gold, but that most of the qnartz was of low grade. The country rock of the mine is a quartz-diorite. Some granite schistose material occnrs along the main veins. A microscopic examination of this shows that it is practically a chlorite-schist. It is composed of a schistose aggregate of minnte grains of feldspar, with much chlorite and calcite. This schist is doubtless an attrition product, formed by movement along the walls of the vein. In one part of the vein there is a good deal of a hard white material, which the microscope shows to be largely feldspar, presumably albite. The feldspar ocenrs in nnstriated interlocking grains, with occasional twinned prisms. There is a good deal of calcite, pyrite and muscovite, and foils of a green chloritie mineral. In the quartz-diorite country rock near the vein are a nnmber of rounded bodies of calcite, some three feet in diameter. This calcite was donbtless deposited in pre-existing cavities.

Gold with Barite.—Mr. W. Lindgren has described an interesting deposit at Pine Hill, Cal. In a zone of decomposed and kaolinized diabase are irregular veins or seams of harite with which gold is associated. Other similar associations are noted.

Mr. Wirt Tassin of the U. S. National Mnseum kindly called my attention to a paper by Henry Louis, on the mode of occnrreuce of gold. Mr. Louis gives a list of 77 species of mincrals, some of which, however, are formed from the decomposition of previously existing minerals that are found in gold veins. Only one feldspar is noted—orthoelase from Colorado. The exact locality is not given. The anthor further says that while iron pyrite is an almost universal constitnent of gold quartz veins, marcasite seems never to occur; and in conclnsion suggests that the gold and qnartz have been simnltaneously deposited in veins from alkaline solutions.

Gold in Calcite.—The Yellowstone mine at Bear valley, Mariposa county, is in diabase. The eourse of the vein is abont W. 20 deg. S. The ore occurs in the altered diabase brokeu up along the vein and recemented with qnartz aud calcite. A specimeu of the ore presented by the superintendent, Mr. McDonald, to the Natioual Museum, shows spots of free gold at numerous points, associated with white quartz and calcite. According to Mr. Hall, the former owner, in the upper workings a good deal of the gold occnrred in calcite.

In the collection of the U. S. National Museum there is a specimen of ealcite in which arc threads of native gold. This was collected hy Dr. W. H. Melville, from the Baunock mine, Montana.

Gold with Quartz in Rhyolite.—One mile east of Onion valley, in Plumas county, Cal., is a dike of rhyolite in the auriferous slate series at the headwaters of Poorman creek, in a decomposed portion of which free gold occurs, associated with little veins of qnartz. As the gulch was very rich below this dike, it is possible that much of it came from the rhyolite. The occnrrence is remarkable inasmuch as the rhyolite is probahly of Tertiary age. This rhyolite is a white rock with abundant foils of a brown mica, and phenocrysts of sanadine and plagioclase

with a few rounded quartzes in a microcrystalline ground mass.

Gold with Cinnabar.—Besides the Blue Wing vein locality previously noted, gold occurs with cinnabar in a vein in diabase, near Coulterville. The cinnabar is in large fine crystals. The mine is the property of C. L. Mast, and is the one referred to by Becker.

Free gold is found with cinnabar in the Manzanita mine, in Colusa county, in the Coast Range, in metamorphosed strata containing *Aucella piochi*, Gabb—a fossil characteristic of the lowest Cretaceous.

The Coming Metal.

A window on Market street, in this city, has a constant crowd of people in front of it. It is full of articles of domestic use made of aluminum. Cups, kettles, pans, dishes, trays, spoons, and a hundred other articles are exhibited made of the bright, light metal.

For years, ever since 1827, men have known that there was such a metal as aluminum. A scientist named Wohler, who experimented upon earths with electricity, discovered several metals unknown previously. Among them was calcium, which costs $300 an ounce, on account of the difficulty of separating it, although every human skeleton contains about $1800 worth of it. But of all these metals aluminum is the white queen. It has a number of wonderful qualities which make it very valuable, and nature, when her time is ripe, evidently intends that it shall be the most useful agent known, as she has created it more abundantly than any other metal. It forms almost half the substance of the surface of the earth. Every clay bank is full of it, and all rocks are beds of it.

Thus far it has been possible to take aluminum out of only two substances—"cryolite," a mineral found in Greenland, and "bauxite," another mineral lately discovered in Georgia and Alabama. In 1883 there were 33 pounds of aluminum produced in the United States; in 1892 we used 260,000 pounds, and 10 years hence we shall doubtless use more than as many millions. When the aluminum cap was put on the Washington monument, in 1885, the metal cost $8 a pound; now it can be bought for 67 cents a pound. One of its peculiarities is its lightness. A solid block of it, one foot square, only weighs a pound. It does not tarnish, and acids have no effect upon it. This makes it very valuable for surgical instruments and for the wires which are used in sewing up wounds. The racing men are putting aluminum shoes upon all racehorses. Not only are they very light, but they preserve the feet of the horse. The rowers, who are always looking for new boats, have had racing shells built of the new metal. They can be made of single sheets one-nineteenth of an inch thick.

Sheets of it are also used for roofing houses. It does not have to be painted like tin, as rust and dampness will have no effect upon it. For this reason it is very valuable in cooking utensils, and furthermore, added to its extreme lightness, it has a great capacity for holding heat, and is also unbreakable. The armies of Europe have begun to see that aluminum will be very valuable for use in war. Even now they are using it wherever a metal may be used about the uniforms. It is as strong as iron and as light as chalk.

Aluminum has qualities which go beyond imagination. By mixing it with gold a beautiful ruby-tinted metal is produced, which can be used in decoration. Violins and guitars are being made of it, as it has wonderful tone vibrations. The ornamental work on the Transportation building at the Word's Fair was on a foundation of aluminum foil. The Diana on the Madison Square Garden tower, in New York, is made of it. But the greatest revolution it is destined to bring about will take place in the air. At last a substance has been discovered which seems to make a flying machine a possibility.

A Big Gold Seizure.

Says a Nogales, Arizona, dispatch of the 15th:

The most valuable seizure ever made by the Customs Service here was a haul made to-day by the force on the Mexican side. A Mexican from Hermosillo named Noriega is now minus $12,000 in gold dust from the Altar diggings of Sonora. The Mexican had the gold in his satchel, 623 ounces, and alighted from the back end of the train and attempted to dodge off and make away with it to the American side.

A rurale having been warned, the officer was on the lookout for him, and demanded an examination of the traveler's satchel. The Mexican said it was all right, but that availed nothing. The valise was taken from the boy carrying it and opened. There was 40 pounds of gold.

Noriega was seized and is now in jail and liable to five years in a Mexican prison. His chance to escape imprisonment is to "renounce" the gold, declaring it is the property of another, which he will probably do. It is suspected he did not own the gold, but was actually conveying it for others, and that he will come in for a share of the seizure. The rurale who made the arrest will get half of the seizure. In Mexico the export duty is ten per cent "mintage" on uncoined gold taken from the country.

In an Arsenic Mine.

Many points of interest are brought out in a description in a technical journal of the way in which arsenic is obtained from one of the most famous mines in England, the Devon Great Consuls. The mine was originally worked for copper alone, and would have been abandoned but for the discovery that the waste thrown out as worthless when copper was sought proved rich in arsenic. Although copper is still raised, it is in small quantities, and the mine has been resolved into an arsenic works. The arsenical pyrites consist of 25 to 30 per cent of iron, 12½ to 14 per cent of arsenic and the rest of earthy matter. After being crushed this is sorted by girls of from 13 to 16 years of age. It is then washed and "jigged" or sifted and passed on to the first calciner, where it is burned with low-classed coal and produces "arsenic soot"—that is, arsenic so mixed with smoke from the coal as to be a gray color.

The arsenic and soot, deposited in combination in the chimney or condenser, are scraped out and taken to the second calciner for purification. The calciners consist of revolving iron drums, through which a fire of anthracite coal is carried on rotating iron furnaces kept red-hot. As the arsenical soot is subjected to the influence of this heat the arsenic is sublimed and condensed. This operation has to be carefully watched, and if the workmen burn the arsenic badly they have to pay for it.

The arsenic is liable to produce sores if permitted to lodge in wrinkles and folds of the flesh, or about the mouth and nostrils. As a rule, however, this only happens when there is carelessness as to personal cleanliness, and the arsenic workers simply have to wash themselves thoroughly every day on returning from work. Otherwise the work is considered healthy. It prevents all eczema, and the fumes of sulphuric acid, as well as the arsenical dust, are fatal to germs of the disease. Most workmen remain at the works for a number of years without suffering, but occasionally the symptoms of arseuical poison, loss of appetite, nausea, frontal headache and anæmia declare themselves. The greatest danger to which the workmen are exposed is met with when it is necessary for any purpose to enter the upright shaft. The effect on the eyes is most painful, and a further curious evidence of the virulence of the pervading atmosphere becomes manifest. The men wear linen garments lined with flannel, and the sulphuric acid fumes completely destroy the linen in a few moments, leaving the flannel intact, so that the men go into the shaft in linen and come out clad in wool. Fortunately it is seldom necessary to enter the shaft, or a great loss of sight would ensue.

King Mining Company.

Col. M. D. Biege, of Chicago, secretary and general manager, and Capt. H. H. Henshaw, vice president of the King Mining Company, are here looking after the company's interests, says the Pony, Montana, *Monitor*. They have closed the contract with Redfield & Mercer to construct a ditch some three miles long for water power. The water is taken from the Big Hole river, and will end on the bench about 80 rods north of the bridge crossing the Big Hole river.

The company's reduction mills, 25-ton capacity, will be erected on the west bank of the Big Hole river, north of the bridge. The water from the ditch will be flumed to the mill, giving a fall of about 40 feet. It will be the best water power and mill site in this part of the State. The machinery for the mill is now in transit, and lumber will soon be on the ground for the mill. It is expected that the ditch and mill will be finished within 60 days and in running order. W. C. Blinn, of Rockford, Ill., will build the mill.

The company is now working a force of miners in the King mine and stoping from the 80-foot level. They have about 150 tons of ore on the dump. Since commencing work from the 80-foot level, about two weeks ago, they have taken out about 50 tons of fine ore. The colonel sent samples of this ore to Butte last week to be assayed, giving an average of the dump, which runs $83.70 per ton—$73.60 in gold and $10.10 in silver. They estimate that there is in sight and available about $2000 tons, which will be extracted and put on the dump for the mill when completed.

The officers of the company feel greatly encouraged over the outlook, and hope in the near future to have their mill in operation, which will be of incalculable value to this section of our State. The gentlemen representing the company are all energetic men and mean business. We welcome them and wish them every success possible. The western office of the company is located here at Twin Bridges, and their reduction mills will be one and a half miles from here.

Cyanide Process in New Zealand.

At the Waihi mine, Karangahake, all the ore is now being treated by the cyanide process. The plant is the largest of its kind in the Australasian colonies—though it is likely to be eclipsed by that now in course of erection at Croydon (Q.)—and it is said to be working in the most satisfactory manner. The *Mining Standard* says there are 13 large vats in operation, and the monthly bullion returns are likely to be considerably higher than formerly. For the 28 days ending May 5th, 1633 tons of ore were treated and crushed for a return of bullion valued at £4493.

Information to hand relative to the treatment of the tailings purchased by the Cassel Company from the Waihi G. M. Company, states that for the month ending May 5th, 2072 ounces of gold, valued at £2644 16s 4d, were extracted from 1920 tons of tailings. This is an eminently satisfactory return.

The New Zealand Crown Mines Company, Karangahake, has been successful in obtaining during the past month from 480 tons a bullion return of £1130.

Excellent progress is being made by the contractors who are fitting up the plant for the Cassel process at the Golden Cross mine in the Waitekauri district. It is expected that everything will be completed in about a month's time.

The Grace Darling Company have accepted a tender for the erection of a new reduction plant, the contract price being £2700. The plant will comprise a 10-head of heavy American stampers, besides the necessary appliances for the use of the cyanide process in connection with the same.

In the Kuaotunu district the Try Fluke Company have lately acquired the Mariposa ground and set men to work there. They have erected an additional five stamps in the battery, and will have no difficulty in keeping it going; and, having obtained the Mariposa ground, they may find it necessary to erect even more stampers. They now hold a large area of country, and will practically have an unlimited supply of crushing material for years to come. The Kapai-Vermont machinery has arrived on the ground and good progress is being made with its erection. It consists of an Otis pulverizer. The stuff will be crushed dry and fed in cyanide vats. The working of this machine will be watched with great interest, as it is the first of the kind in this district. The mine itself is looking remarkably well, and ought to give a good account of itself when working.

The Telephone Dead Beat.

"If there is a variety of dead beats," said an eminent citizen this morning, "which annoys me more than all others, it is the man who moves into your building because you have a telephone. At first he drops into your office and tells you his wife bade him order a steak before noon, and that he had forgotten whether it was porterhouse or sirloin. He says that a family across the street from his house has a 'phone, and with your permission he'll just ring 'em up and have 'em send for Mrs. X. Well, that doesn't bother you much because you are thinking of the family across the street, but in a week or two Mrs. X. begins to call you up with the request to step across the hall and bring her husband to the 'phone. Then the husband begins to drop in to telephone his commercial acquaintances till two-thirds of his entire business is done over your wire. There is only one more step. One of his agents is up, say in Mount Morris, and it is very necessary to communicate with him immediately. As much as $4 may depend upon a word. He hurries in and says of course you have connected with Mount Morris. It is marvelous how man's inventions put the miles at naught.

"While you are chalking up 25 cents to profit and loss, he has become the possessor of your telephone. From that time on, if you are using it when he comes in, he waits impatiently and gives you a look when you ring off as much as to say: 'Sir, you are taking liberties with my property which I must resent.' There are but two things left to do—take out the telephone or move out yourself. I am fond of my offices, so the telephone had to go."—Rochester Standard-Union.

To Raise the Drowned.

An effective method of raising the drowned is given us by a gentleman of experience, as follows: Take a half gallon fruit jar, fill it half full of unslacked lime, then put on the rubber and screw the metal top perfectly air tight. Perforate the top with small holes, attach a weight and sink the jar in the locality where the body of the drowned person is supposed to be. As the water seeps into the jar the lime gradually becomes slacked and generates a gas which in ten minutes' time will cause an explosion with the force of dynamite, raising every object to the surface within a radius of 50 feet. Those who have seen the operation say it has never failed to bring the desired results.

Figuring Out a Profit.

The following is from the Silver City, New Mexico, *Enterprise*. It shows how sanguine many men, including newspaper men, are, and how easy it is to figure out big profits—on paper.

Talking of the Confidence mine at Mogollons, the *Enterprise* says:

One adit level has been driven upon the vein for a distance of 1300 feet, which attains a depth of 420 feet. Air shafts have been sunk at intervals to intersect the tunnel, and they also serve as means of development and blocking out the ore bodies. The ore bodies extend throughout nearly the whole length of the adit level with but short intervals of low-grade ground between the ore chutes. The ore bodies average fully five feet in width, and the average grade is about $15 in gold and 30 ounces in silver. There is also a winze sunk from the bottom of the level to a depth of 80 feet, which shows five feet of higher grade ore than the above, running about $18 in gold and 36 ounces in silver. Leaving out all the ore exposed in the bottom of the level, and also that developed by the winze below the level, and making an allowance of 300 feet for barren or low-grade ore between the main ore chutes, which is more than the barren ground covers, we would have 1000 feet in length multiplied by 300 feet average height above tunnel by 5 feet average width of one body would give the number of cubic feet of ore developed and blocked out ready for extraction as 1,500,000 cubic feet. At 12 cubic feet per ton of ore, we have 125,000 tons in sight, which, countiug very conservatively, an average of $25 per ton saved in the mill would give $3,125,000. Under any reasonable hypothesis the ore bodies can be safely estimated to go as deep as already explored by the winze—say 100 feet below the adit level. This additional depth would add $1,040,000 to the above calculations, making a total of $4,165,000 absolutely to be depended upon. The cost of extraction cannot possibly exceed $2 per ton on these ore bodies now developed. It is understood an offer has been made to contract for the hauling to the mill at $1 per ton, while the milling will not cost to exceed $7 per ton at the outside limit. Allowing ten per cent of the proceeds, or $2.50 per ton, amounting to $416,500, to be expended in further development and for incidental expenses, there would then be left a net profit of 50 per cent or $2,082,500 on the ore in sight in the mine.

A Big South African Mine.

The Robinson Gold Mining Company in the Transvaal last year ran 60 stamps and crushed 94,842 tons of ore, which had an average value of £3 10s per ton. It derived about 79 per cent of its production from the ore worked in the mill, 8 per cent from concentrates by chlorination, and 13 per cent from the reworking of tailings by the cyanide process. The latter yielded a fair profit, though the extraction was only 68.7 per cent of the assay value, a proportion which the company hopes to increase. It is to be noted, says the *Mining Standard*, that in this mine, which has the deepest workings of any on the Witwatersrand, the proportion of pyritic to free-milling ore is increasing rapidly with depth, and the time is within view when the free-milling ore will entirely disappear. This can hardly be a pleasant outlook for those Witwatersrand companies which have based their expectations on a continuance of free gold and cheaply worked ores in the deep levels on the main reef, of which so much has been said. The Robinson is providing for the future and expects to extend the concentrating plant and the use of the chlorination process, as well as that of cyanide on the mill tailings. Like all the Transvaal companies the Robinson relies chiefly upon native labor; but does not find it altogether profitable or reliable. At present, however, it is a necessity, and will probably continue so for a long time to come.

Gold-Milling at the North Star Mine, Grass Valley, Cal.

(*Continued from page 33.*)

plates and shaking-table plates combined. The grade of these new plates is approximately uniform at 1½ inches to the foot. In Fig. 6, on this page, these improved plates (which cannot be too highly recommended) are shown in plan and elevation. The result of this introduction by the writer has strengthened the desire to remove the narrow sluices still remaining.

The lower illustration on page 33 shows the old and new plates, in the immediate foreground, to the left and right respectively.

Two-thirds of all the gold recovered by amalgamation is found in the batteries. The yield is, however, variable, frequently reaching 75 per cent. Of the amount recovered from the outside plates, the battery and apron-plates will produce 70 per cent, the sluice-plates 23 per cent, and the shaking-tables 7 per cent. The average value of amalgam from all sources is about $7.25 per ounce, the fineness of the gold bars is 856.

The batteries are cleaned up fortnightly; the outside copper plates, every other day, frequently daily, and, on rare occasions, morning and evening.

In addition to the usual method of recovering the amalgam from the plates, the writer introduced, several years ago, the method of hot-water "sweating," which can be recommended for its simplicity, safety and excellent results. The effect of simply pouring boiling water upon the plates or immersing them (on the apron), is a source of as much pleasure as surprise when the amount secured from a poor-looking plate is weighed. Notwithstanding previous sweatings during the year, the December or annual sweating at the North Star mill produced 1703 ounces amalgam from which 600 ounces gold was obtained, valued at $10,524.82.

Leaving the battery-floor, the pulp is conveyed through three-inch pipes to the concentrators on the floor below. Each battery of five stamps being provided with two machines, the full complement consists of twelve Triumph and four Frue vanners. The latter machines are preferred, and were introduced when the ten original stamps were installed. The machines are conveniently arranged on one floor and readily overlooked by one man on each shift. The appearance of the concentrator-floor is presented in the upper illustration on page 33.

The ore crushed at the North Star mill contains about four per cent of "sulphurets." Their average value is $53.58 per ton; and they have yielded in seven years a total product of $236,756.63. The concentrates are sold to the local chlorination works.

From the concentrating machines the pulp escapes as tailings, containing more

or less gold, notwithstauding a high percentage saved of the ore value (reaching 94 per cent under favorable conditions). At the present writing, there is in operation a simplex rotary amalgamator, treating 10 tons of tailings per 24 hours. Results obtained thus far have redneed the loss in the tailings 22 cents per ton.

The mill is operated entirely by water power and notwithstanding a high rate per available horse power, the cost of power per ton of ore crushed has not exceeded $0.32. The water used has previously been utilized by the Original Empire Mill and Mining Company nnder a head of 450 feet. At the North Star, the effective head is 275 feet at the mill.

In conclusion, to accompany the foregoing description, the following tables have been prepared, giving details of the cost of milling at the North Star, extending over several years. During this period the average value of the ore crushed has been very high; and for the year jnst concluded a gross production of $335,757.04 has been attained.

ANNUAL TABULATED COST OF MILLING AT THE NORTH STAR MINE.

Table I. Year.	Supplies. Shoes.	Dies.	Quicksilver.	Screens.	Mill Castings	Concentrator, Feeder Parts, Assay Supplies, Sundries.	Total.	Labor. Amalgamation.	Concentration.	Rock Breaking Sundries	Total.	Power Total.	Grand Total.	Tons Mined. Total Crushed.	Cost. Total Amount.

Going Back Again.

Of some who came without a welcome and will leave without a regret, the Chicago *Journal* of the 17th inst. says:

The European low rates inaugurated by the trading steamship lines may result in a wholesale exodus in Chicago of many men connected with the late strike. Never before in the history of steamship rates has it been possible to go from Chicago to a European port or city so cheaply. Since the cut rates have been inaugurated the exodus from Chicago and the Northwest to various points in Europe has figured up a third of the traffic to New York, according to estimates of local steamship lines, and the announcement of the last great cut in rates has started a real hegira of European-born people. Dozens of men who said they were now on strike have been making inquiries at the local steamship offices within the last few days, expressing their intention of returning to the "old country" in case the strike was a failure. There are half a dozen interesting phases of the present situation, and there is much food for thought in the depletion of the standing army of unemployed in this country by the return of thousands of workers to their homes abroad. It is estimated that before long labor will be at a premium instead of a discount, and there are not a few who figure on a season of prosperity as a consequence of the return to Europe of thousands who have been in the past six months unsuccessful candidates for employment.

Gold in South Africa.

E. A. Tomlinson arrived in this city on Saturday from the gold fields of South Africa. He left this port for Cape Town nearly two years ago, and remained there for about eighteen months.

"The range or ridge," said he to a *Chronicle* reporter, "is between sixty and seventy miles in length, and the gold-bearing ledge extends the entire length. It is a very extensive mining district, but the ore is not high grade and one ounce to the ton is the maximum product. Johannesburg, the capital city, lies almost in the center of this range and is 1013 miles from Cape Town. The mines are provided with the best and most modern machinery, and the ore is more thoroughly worked than here in California. The plants are extensive and represent heavy investments of capital. In fact, the low-grade ore requires it and the ordinary prospecting miner could not make a living at it. Labor, which is almost exclusively blacks, is readily obtained at from two to three shillings a day. The entire population of Johannesburg is something over 40,000, only a small portion of which is white. The leading positions in the mills, and, in fact, in the mining district, are held by Americans, largely from this State.

"It is a peculiar country, being nearly level for miles, and does not look like a gold-mining section. It looks more like an open prairie, but the gold-bearing ledge is probably the most extensive in the world. By using a diamond drill this ledge, which is at an incline, has been traced for half a mile in width for sixty miles. Outside of this mineral belt the country looks productive, but is not, and it is best adapted for grazing. Fever of the typhoid type prevails throughout the year, and is worst during rainy weather. Altogether, it is not a desirable place for a poor man to go to, and probably the worst place in the world to get stranded. The mining machinery there is nearly all of American manufacture, and American-made tools are preferred to all others. On my return I was in Cape Town for a few days. Business is at a standstill there, and there are more Mohammedans than Christians in all branches of trade there. All through that country there was one reminder of California, and that was the canned fruits. I had San Jose fruits all the time I was there."

Rich Strike.

C. M. and Asa Wilson, two well-known prospectors from San Joaquin county, struck a very rich quartz ledge on the hill about half a mile east of town. The ledge is between the Mexican, owned by S. B. Davidson, and a ledge owned by J. Rodgers. In two days C. M. Wilson took out something over $400. Some big pieces of rock have been on exhibition in the show window of the Miners' Drug Store, says the *Messenger*, and attracted considerable attention. The rock which we saw fairly sparkles with big thick streaks of gold running through it in every direction. At present the ledge is but six or eight inches wide, but if the gold holds out in even half the quantity the Wilson brothers have struck a regular bonanza.

An Advance in Values.

The present site of Chicago was sold by the Indians for three cents an acre. Taking the most valuable corner lot in the business part of the city as a criterion, the value was increased 130,000,000 per cent. In 1830, when there were fifty people scattered around Fort Dearborn, a quarter of an acre of land in what is known as the "heart of Chicago" could have been purchased for $20, and in 1834 for $200. With our latest knowledge of real estate "booms" it is easy to picture the vision the owner must have had of the future glory of Chicago when he raised the price of his corner lot from $200 in 1834 to $5000 in 1835. To-day the lot is assessed at $1,200,000.—Real Estate Record.

The Yukon Gold Sands.

The Chilkat brought up a Mr. Dyer and a company of four from Seattle who are bound for the Yukon gold fields. Mr. Dyer brought with him a four-horse power engine and boiler with which to run a centrifugal pump that he inteuds using on the rivers and lakes in that section, pumping the rich sands of the shores into sluice boxes, the outfit of which will weigh in all about 4000 pounds, and is of very modern make. Three of the number are said to be first-class mechanics, one a mining man and the other a ship carpenter. They went over the Chilkat Pass.—Alaska Mining Record.

It is asserted that large purchases of gold are being made in Denver by men who expect to see a premium on the yellow metal before '95.

Book Notices.

A Text Book of Ore and Stone Mining: by C. Le Neve Foster, B. A., D. Sc., F. R. S.

This is the title of an exhaustive work of 750 pages with 717 illustrations, being a compilation from various sources of a vast amount of practical knowledge regarding the science and art of mining. Science may, in general, be defined as organized knowledge; in the same way art may be considered as the application of science. The work received from Londou comprises both, and is of manifest value. Its chapters treat of the mode of occurrence of minerals, prospecting, boring, breaking ground, supporting excavations, exploitation, haulage, hoisting, drainage, ventilation, lighting, descent, ascent, dressing, legislation, condition of the miner, accidents, etc. The illustrations are remarkably numerous, clear and complete. Some of them are good copies of the originals that have appeared from time to time in the Mining and Scientific Press, and all add greatly to the permanent value of the work. The subject is a vast one, very well handled, there being little of theory or hypothesis and much of practical information of great worth. The chapter on prospecting is probably of least value from a local point of view of any in the book. The chapters on boring, breaking ground and timbering are excellent. The experience of the entire mining world is herein laid under contribution, and the result is of importance to every one who has anything to do with mines. The matter of drainage, ventilation and lighting is given considerable prominence, and the treating of ores (here styled "dressing") is given great attention. The chapter on "principles of employment" gives many interesting statistics regarding the different modes of paying men employed in mines in this and other countries.

In his preface the author says his object is "to assist students in acquiring a knowledge of the art of mining." It does this and more in compiling a large amount of up-to-date information that is of manifest value to many who have passed the "student" stage, and is an acquisition to the mining literature of the times.

The price of the book, which is just issued, is $8.50. It is published by Chas. Griffin & Co., Ltd., Exeter street, Strand, London, England, and can be had at this office.

The Mineral Industry: its Statistics, Technology and Trade; 1893.

The Scientific Publishing Company of New York send the second annual volume of the above work, just from their press. It is much larger than its predecessor, Vol. I of 1892, and of greater value, though at the time Vol. I was issued it was deemed difficult to improve upon it.

Information, to be reliable, must be authentic; to be valuable, must be accurate, and as authenticity and accuracy characterize the entire work it needs no further commendation. Its scope and volume are coequal with the industry of which it treats, and every effort has been evidently made to maintain a high standard of excellence.

The work is edited by Mr. R. P. Rothwell, assisted by several mining engineers and metallurgists, whose portraits embellish the book, and whose brief biographical sketches evince their fitness for the labor so admirably performed. To any one interested in any way in mining, the book is valuable for reference and information, the statistics being unusually complete, and of so recent a date that there is a freshness to them that renders them superior to the ordinary Government report. There are over 900 pages in the work, every one of which is of practical value. It is published by the Scientific Publishing Co., 253 Broadway, N. Y. The price is $5.

From Greenland's icy mountains, from India's coral strand and various other far-off places, papers come to this office, many unique and interesting. The most singular one this week is No. 1, Vol. I, of "Africa," a monthly publication devoted to the development of the dark coutinent—but published in Chicago. After perusing the glowing pages of this journal, one wonders why the editors of "Africa" should fool away their time in an insignificant no-account locality like Chicago when gold and fame and all life's prizes await the men who go to Africa. Without in the least disparaging that delightful country, it would seem that "Africa's" mission would be more successful if published in and issued from the country which it extols.

Suit has been brought in the U. S. Circuit Court, by A. G. Renshaw of London against J. T. Treadwell et. al., asking for $140,000, plaintiff alleging that Treadwell and associates have defrauded him of that amount. Some time ago the Alaska Gold Company was organized here to develop the Bear's Nest mine in Alaska. Stock and debentures were placed on sale, and the plaintiff bought of the latter to the extent of his present claim, getting a controlling interest and putting out Jas. Treadwell and Geo. Smith, part owners. Trouble ensued at the mine, which closed down, and now the matter goes into court, Renshaw claiming to be the victim of fraud and misrepresentation. John T. Treadwell says he has nothing to do with it, having long since transferred his fifth interest to Jas. Treadwell and Geo. Smith.

The value of the silver and lead output in New South Wales during 1893 was £3,031,720, which was only exceeded once, in 1891, since the opening of the silver mines there. The silver mines at Broken Hill, on the Barrier Ranges, contributed nearly the whole of the output, and the quantity of silver produced from these mines during 1893 was almost 16,000,000 ounces. This it is thought will be increased when the companies are successful in devising a mode of treating their low-grade sulphide ores at a profit.

The output of gold in New South Wales to the end of 1893 was 10,709,610 ounces, valued at £39,853,941 10s. 10d. The quantity produced last year was 170,288 ounces, valued at £651,285 15s. 8d., being the largest output in twenty years. This result is due somewhat to the large number of unemployed men sent to the gold fields by the Colonial Government and to the discoveries made by parties aided out of the prospecting grant voted by the Colonial Parliament.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER VIII.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

Some oil was gathered by arranging wooden tanks on tbe priuciple of a chemist's separating funnel, into wbich tbe water and oil were pumped and the water drawn off from below uutil a barrel or more of oil had accumulated in the tank. This was mostly sold for medicine. Tbe petroleum interests have assumed sucb vast proportions at the time of this writing, and the oil bas become so important au essential to the wants of mankiud, that it will be iuterestiug to know and relate tbe succession of events leading up to this condition from the earliest settlement by the Europeans.

1629.—Jos. Delaroche Daillou, a Frauciscan missionary, crossed the Niagara river aud wrote of the Oil Creek springs, stating that the quantity was large. His letter, dated July 18, 1627, was publisbed in Sagard's "Historie du Canada," in 1632 ("Geological Survey of Pennsylvania, 1886, part II, fol. 575.")

1642.—Jesuit missionaries, iu the territory of the Eries, found a thick, oily matter floatiug on the surface of the waters which was inflammable.

1670.—A map of the French-American colonies was publisbed, on which "a fomtaiu of bitume" is figured. It is located where Oil Creek was afterward kuowu.

1695.—John Woodward, one of the earliest Euglish writers on geology (Essay Toward the Natural History of the Earth, Londou, 1665, fol. 197), thus refers to petroleum oil: "The bitumen which is fouud in lumps or coagulated masses in some springs, and which is found floatiug in the form of oil on tbe surface of the water, when it is called by uaturalists uaphtha and petroleum. * * *"

1735.—Mineral oil was discovered iu Alsace, iu Germany, which was fouud to be a good lubricator. In 1880 this oil was obtained from a pit like a miniug sbaft 3 by 14 feet. From this shaft levels were driven iu which the oil was collected. The depth of this shaft is not stated.

1739.—Although the attention of the Royal Society was about this time called to the fact that in the manufacture of gas a black oil remains, as a by-product, no practical results came of it, aud it was left for tbe French to first distill coal oil from bituminous sbales.

1772.—Peter Kalm (Travels in North America) published a map on which Oil Creek spriugs are located. (Min. Press 31–130.)

1781.—A patent was grauted to the Earl Dundonald for distilling oil from coal.

1789.—The followiug is from the Massachusetts magazine, 1789: "In the northeru part of Penusylvania there is a creek called "Oil creek" which empties into the Allegbany river. It issues from a spring on the top of which floats an oil similar to that called Barbadoes tar, and from which one may gather several gallous a day."

1814.—Petroleum was known in Ohio iu salt wells in Wasbingtou couuty.

1815.—About this date oil in considerable quautity was produced at Oil creek. A poiut was sought where the oil oozed up to and flowed on the surface. This being found, a pit was dug not many feet deep. This rude depression soon filled with water, on the surface of wbich floated a skim of oil. At certaiu iutervals a common blanket was spread on the surface which imbibed the oil, but rejected the water. The blanket was then wruug iuto a suitable receptacle.

1819.—From a salt well in Wayne county, Kentucky, black oil came up with the brine; there being uo kuown way to preveut it, the well was abandoued.

1829.—A well being suuk at Burkesville, Cumberland, Kentucky, at a depth of 300 feet, oil aud gas were met with, the former spouting to a great height. The force of the latter was sufficieut to throw the tools out of the well. The oil ran down the Cumberland river and became accidentally ignited. Old inhabitants for years after told of the strauge sight, how the surface of the river was iu flames. A great quantity of oil—perhaps many thousands of barrels—went to waste, but no practical use for it was then known. Eventually the flow of oil ceased, but for a time small quantities were sold as "American oil." Gas from the salt wells at that time was burned uuder the kettles iu which the brines were coucentrated. By another version, in 1829, in Cumberland county, Kentucky, a well being sunk for salt water began to flow with mineral oil, to the surprise, annoyance and cousternation of those who were expecting briues only. The large quantity of oil which at that time went to waste was a source of great inconveuieuce and iujury to those interested in the well. This oily flux was regarded as almost miraculous. From this well some of the oil was put up in bottles and sold as a medicine uuder the name of "American oil."

1845.—Crude oil from Tarentum, Alleghany county, Penusylvauia, was used as a lubricator mixed with sperm oil in the Hope cotton factory of Pittsburg. It was considered better, while it was cheaper, than pure sperm oil. A contract was made with the owner of tbe well to furnish two barrels per week. This contract continued for ten years.

1847.—Jas. Young, a Manchester chemist, experimenting on a shaly coal taken from a mine iu Derbyshire, obtained au excellent lubricating oil. This success led to the refining aud preparation of mineral oils, since become a vast industry. Young's idea was not new, for the artificial distillatiou of coal is thus referred to by Dr. Erasmus Darwin: (The Botauic Garden, a poem iu two parts, 1791. Additional Notes, part 1, 23.) "Similar to the artificial distillation of coal which has for many years been carried ou in this place on a smaller scale above ground." Dr. Abraham Gesner, a noted geologist aud chemist of Nova Scotia, obtaiued asphaltum oil and naphtha from Trinidad bitumen. Tbese be burued in lamps during a lecture giveu by him in Halifax. He had the year before commeuced distilling oil from Prince Edward's Islaud coal.

1849.—Samuel M. Kier, of Pittsburg, commeuced the sale of crude oil as a medicine under the trademark of "Kier's Petroleum." He also had salt works at Tarentum and was annoyed by the oil, for wbich be had but little use.

1850.—James Young patented in England a process for obtaining paraffine oil from coal and shale. For some years before this date the supply of whale oil was diminishiug aud ships were sent to the most distant parts of tbe earth iu search of it; the price rose in proportion to the scarcity, and the ingeuuity of man was taxed to tbe utmost for a substitute. Coru oil, spirits of turpentiue mixed with alcohol, under the uame of "buruing fluid;" redistilled turpeutine, known in trade as "campbene;" lard oil aud oil from various seeds, partially supplied the demand. Tbe danger consumers incurred from the use of camphene was very great, aud accidents were frequent.

Youug and his associates begau to manufacture lubricatiug aud illuminatiug oils by distilliug a crude petroleum or bituminous shale found in Derbyshire, but the supply beiug limited, they substituted Scotch Bogbead coal.

The English experiments showed that an excellent quality of oil could be extracted from coal aud shales, well adapted both for burning and lubrication. This led to investigation and experiment in the United States, and the practical use of the crude petroleum from the springs so long kuown.

Crude petroleum from Oil creek, Pennsylvania, was refined and sold at Pittsburg and elsewhere, but for the reasou that the supply was small aud the price bigh, it was fouud to be more profitable aud ecouomical to distill bituminous shales. The price of whale oil still risiug, much experimental work was doue with a view to discover some substitute.

Mr. Kier had partially refined petroleum and sold it under the name of "Carbon Oil" in Pittsburg. This continued until 1856, wben Mr. Bissell suggested to his frieuds the idea of sinkiug deep wells at Tarentum specially for oil, which led to tbe orgauization of the Seneca Oil Company, by which Drake's well, the first oil well, was sunk.

Drake, aud Jas. M. Towusand, both of New Haven, Conn., were specially active in search for a supply of crude material.

In 1852 tbe U. S. Chemical Manufacturing Company of Waltham, Mass., commenced the manufacture of a lubricating oil from coal tar, which was called "coup oil;" 175,000 gallous were produced. (Am. Cbem. 2, 401.)

Iu 1854 Dr. Gesner procured a patent for making "kerocene" oil, named from the Greek "keros," wax; camphene being at tbe time a well-known buruing fluid, its termination was added to tbe Greek root, aud so the new word was coined. Tbe first mineral oil manufactured in the Uuited States was made by him at the works of the New York Keroseue Oil Compauy on Long Islaud.

The production of coal oil was at that time quite large in the United States, there having been no less thau 56 works engaged in its manufacture. Tbe following was the method pursued in making it. A quautity of crude oil, having been distilled off roughly, was submitted to fractional distillation, after which the product was treated with sulphuric acid, whereby the dark maltha was thrown down. The acid was theu neutralized by excess of caustic soda, and the clean portiou thoroughly washed with water to remove both acid and alkali. The fluids were theu either sold as they were or again distilled, this depending on the quality required. The production of coal oil, though discontiuued in the United States, is still carried on in other countries. Where practicable the busiuess is deserving of eucouragement, both as a means of utilizing what in mauy localities is a cheap and abundant material, and of ecouomizing our petroleum resources, which we are exhausting at a rapid and in some cases reckless rate.

(To be continued.)

ALUMINUM is gradually working its way into various products in the iron line. Experiment bas proved that aluminum mixed with iron makes the latter metal pour smoothly, prevents blow-holes and liability of cracking and benefits the iron in every way. Such experiments have been successfully made by the Michigau Stove Compauy at Chicago.

How High Will a Kite Go?

It is one of the most difficult undertakings imaginable to even approximately estimate the beight of a kite above the earth. Tbis is ou account of the fact that objects floating in tbe air seem to be farther away than they really are. It may be safely said that 1800 feet is the maximum altitude that can possibly be attained by a single kite. A kite flying at tbe height meutioned will appear eveu to a conservative observer to be nearly, if not quite, a half mile above the surface of the earth, but a careful measuremeut of a string and its angle will quickly prove that it could not have beeu more than a fourtb of a mile above the ground. Ordinarily a kite will go no higher, eveu if more string be paid out. Tbis is because the wind depresses the cord aud causes the kite to really recede when it appears to rise. It bas beeu said that it is possible to arrange several kites in such a manner that they will reach a higher altitude than it is possible to attain with a single kite. In this manuer, where three, four or even a dozen kites have beeu used, remarkable heights have beeu reacbed.

Where more than one kite is used, only the main one is attached to the end of the string, tbe otbers being attached aloug the main liue (in a manner similar to the arrangement of the hooks along a "trot-liue") at au average distance of about 12 feet apart. Hinkleman, who made experimeuts at Buda-Pestb, and Irlson and Watson, wbose investigatious under the Russian Academy of Scieuces were carried ou at Edecnea, Finlaud, report curious results. Where single kites could be forced up into the atmosphere to a beight of 1500 feet, a pair could be made to asceud to a height of from 2000 to 2100 feet, aud a tandem easily reached the high-water mark of 2500 feet. The three experimenters alluded to believe that witb a proper arrangemeut of the kites, aud witb a scieutific adjustmeut of both tbe tail aud string, a height of two miles will eventually be reached.

Composition of the Sea.

A little consideration will show that all the known chemical elements—and even the unknown ones, too—must be contained in solution in the waters of the ocean. Rivers flowiug over the laud are continually taking up mineral matters in solution, and these substauces are all added to the mass of material dissolved in the oceanic waters. The Thames every day carries to the North sea some 2000 tons of dissolved material, and, if all the rivers of the globe work at something like the same rate, 20,000,000 tons of mineral matter must day by day be added to the store of materials held in solution by the oceau.

Now, all the chemical elemeuts are capable of entering iuto compounds which are to a greater or less extent soluble iu water, aud heuce we canuot doubt that in the enormous mass of materials dissolved in the vast body of sea water in our globe, all the elementary bodies must be represented.

It is true that the chemist, by his most refined methods of analysis, is unable to detect tbe proportiou, even if he is able to determiue tbe presence of the rare elementary substances which occur only as "minute traces" in sea water. When a large quantity of sea water is evaporated, we get a mass of chlorides aud sulphates that can be separated by analysis; but even the very delicate tests of spectral aualysis fail to make manifest many of the rarer metals aud other elemeutary bodies that must certaiuly be present in the mass. In a well-known case, the copper sheathing of a vessel has been proved to have taken up silver from the sea water by electrochemical actiou, though it is probable that all our ordinary analytical processes would have failed to reveal the existence of the metal in the water itself.

Fifteen Years Ago.

From au old copy of tbe Nevada *Transcript* publisbed fifteen years ago, it is learned that for the month of July, 1879, the yield of some of the mines in that county was as follows:

Deadwood (quartz)	$ 6,100
Idaho (quartz)	29,300
Milton (gravel)	50,500
Murcbie (quartz)	5,000
North Bloomfield (gravel)	28,900
Pittsburg (quartz)	7,900

This was only about one-half the bullion product of tbe section at that time, some 20 or 30 mining companies decliuing to give information of their clean-ups. Of the above-named companies, the Deadwood and Murchie have not been operated for several years, and the Pittsburg has been worked spasmodically, with varied success. The company at present working the mine bave made importaut developmeuts, and the iudicatious are that the property will soon be on a payiug basis again. The Murchie has not been worked for a number of years, although it is generally believed that, if operated economically and skillfully, it could be made a paying property.

THE average rate of dividend paid on railroad stock in the Uuited States in 1892 was 2.11 per cent.

Scientific Progress.

Effect of Musical Notes on Explosives.

Some singular facts have been developed in regard to the influence of musical notes upon explosives. When an "intense" explosive is approaching the "critical" stage, and its molecules therefor are in a condition of very unstable equilibrium, the sudden emission of a musical note will frequently bring matters to a climax and induce detonation. It has been found that of a certain sample of dry fulminate of mercury the lowest temperature at which it would explode was 342 deg. Fahrenheit, and portions exposed to a heat of 335 deg. for some time, allowed to cool and again heated to that degree (these alternations being several times repeated), remained without change. Yet particles of the same fulminate, placed as before on an iron plate, but at a temperature of 310 deg. to 320 deg. only, would generally explode sharply when certain notes were sounded near, upon a violin string or a cornet. With the human voice it was much more difficult to obtain an effect of this kind, but occasionally such an experiment would succeed. Similar results were noticed with most of the nitro-compounds, blasting gelatine included, while chloride and iodide of nitrogen were frequently so explodable at the ordinary temperature. Lascelles-Scott, assuming that (a) the molecules of explosives were always in a condition of either linear vibration or spiral "swing;" (b) that the velocity of such oscillations was constant with each substance according to its composition; (c) that the amplitude or wave length thereof varied with the temperature; thought it not unreasonable to suppose, as the oscillations extended until they approached the point of disruption, that the impact of sound vibrations bearing some simple numerical relation to their own might carry those molecules too far, and thus precipitate their severance. Whatever the true explanation of the phenomenon may be, it is certain that a given (explosive) substance may be more readily detonated by a certain note; for instance, with a "pitch" wherein (the third space in the treble clef) was represented by 538 vibrations per second, the nitro series of explosives seemed to be most influenced by the note F: the fulminates by the treble D; and the upper B-flat more successfully detonated iodide of nitrogen than any other note. These are decidedly uncomfortable details, and one cannot help speculating on the extent to which the programme of a regimental band on parade might have to be modified in consequence of the vicinage of a given explosive "approaching its critical temperature."

Needs Demonstration.

A New York inventor claims to have discovered a process for the production of nitrogen in the manufacture of fuel gas. He says he can take two tons of coal (gross weight) and 866 pounds of crude petroleum, pass the material through his furnace, and get 104,000 cubic feet of gas, with one ton of the sulphate. The gas is claimed to be equal in heating power to five-eighths of the coal and oil, while of greater utility for many industrial purposes, and the ton of sulphate of ammonia is worth $60. After allowing for the cost of the process the inventor figures out a net profit of $10 on each ton of coal used.

"Ordinary coal gas contains only 1½ per cent of nitrogen, equal to the production of 23 pounds of the sulphate, but it is held that at a temperature of 2200 in the retort, and in the presence of lime, soda or potash, the nitrogen will combine with carbon and subsequently with alkali. Then the nitrogen gives up its carbon to the oxygen of steam and interlocks with the hydrogen, the result being the desired volatic product. It is said that the experiments already made have demonstrated the value of the claim, as in a small furnace 600 pounds of sulphate of ammonia have been obtained for each ton of the coal used."

The Chemistry of Cleansing.

Prof. Lewis, in his lecture on "The Chemistry of Cleansing," has put some scientific facts into very plain language. He says that dust is one of the materials which nature used for her cleaning-up processes. This comes about since dust contains "germs," which, by provoking and aiding decay, resolve matter which nature wishes to remove into the elementary constituents of carbon-dioxide and water vapor. As for these germs, we swallow, each of us, some six million in a day, and when nature arrives at the conclusion that we are so feeble that we need removing, a few of these are specially utilized. Prof. Lewis spoke of the usefulness of tea leaves in ridding us of dust, and then passed on to the substitute for tea leaves, which we use to get rid of the dust accumulated on our skins—soap. The reason that mere rinsing in water will not take the dirt from our hands is that the natural oil of our skins glues the dust. The action of soap dissolves this union. Soap may theoretically be said to consist of alkalies, of olaic and of stearic acid. An alkali of itself would loosen the dust from the fatty matter on our skins, but alkali by itself is injurious to the skin. Here the two oily acids come in; they counteract the effect of the alkali, and have also a modifying effect on the skin itself. Prof. Lewis said that he spoke of the "perfect soap," as against the ordinary soap of commerce. There is a good deal sold which is not perfect, which contains an excess of alkali—or an excess of water—profitable only to the manufacturer. Prof. Lewis added, with a touch of humor, that the object of some manufacturers seems to be to make water sufficiently stiff to stamp it into tablets. Some soaps contain 50 per cent of water.

Not many days ago, says the New York *Herald*, a few gentlemen connected with the telegraphic or electric business were assembled in a room in the eleventh story of the new Postal building on Broadway. They had not been there very long when astonishment was depicted on their faces, and by and by found expression in words. A book on the table about which they stood or sat was speaking. "Is it possible," exclaimed Mr. Chandler of the Commercial Cable Company, "that those spoken words can come from that book?" "Yes, it is," said Mr. Francis W. Jones, the electrician of the company; "that is Mr. Marshall's telephone." W. Marshall, of No. 709 Lexington avenue, had prepared this remarkable feat for the electricians. He began by taking up an ordinary book and placing in the leaves several slips of tin foil, about one and a half inches wide and four inches long. Then he attached a couple of fine wires to another room, where they were attached to the transmitter of a telephone. Then a conversation began, with Mr. Marshall in one room and one of the persons in the room where the book lay. Each word that came from the book could be distinctly heard in every corner of the room. The visitors had never experienced anything of the kind before, and they said it would eventually revolutionize telegraphy.

Mr. Siemens, the eminent electrical engineer, is now in Ottawa, Canada, and has made a proposition to lay the proposed cable from Victoria, British Columbia, to Sydney, New South Wales. He will guarantee to complete the work within three years, and says that his expenses will be less than any other bidder. His offer is being considered by the Dominion Government.

Late experiments give considerable strength to the belief that the aurora borealis is caused by an electrical discharge among the particles of meteoric iron dust contained in the atmosphere.

Educational.

INSTRUCTION BY MAIL

In ARCHITECTURE; ARCHITECTURAL DRAWING; PLUMBING, HEATING and VENTILATION; BRIDGE ENGINEERING; RAILROAD ENGINEERING; SURVEYING and MAPPING; ELECTRICAL ENGINEERING; MECHANICAL DRAWING; MECHANICS; ENGLISH BRANCHES, and

Mechanical Progress.

Scarcity of Babbitt Metal.

Talking of babbitt metal, at a recent meeting of the New England Railroad Club, Professor Waldo said:

In looking up the subject of lubricants, we found that a certain man, Isaac Babbitt, had received a gold medal from the Massachusetts Mechanics' Charitable Association in 1841, and that the ground for the award of that medal, and the subsequent grant from Congress of $20,000, was expressed in the letter from the master mechanic of the Boston & Providence Railroad Co., which was written from Roxbury in September, 1841. In this letter he says that for "fourteen months a box of Mr. Babbitt's description has been used continually and has traveled nearly thirty-one thousand miles. He cannot see that the box has received the slightest injury. They require one-half the usual quantity of oil and very little attention, and are at least seventy-five per cent cheaper than any he has ever used before."

If you follow the history of this distinguished inventor, you would know that subsequently he received a grant of $20,000 from Congress in consideration of his having done a great thing for mankind.

I was told the other day that it was impossible to buy genuine babbitt metal. I went to the Baldwin Locomotive Works, with which we had some professional relations, and asked them where they got genuine babbitt. They said it could not be bought; it had to be made according to specification. I sent out and bought 40 samples of metal marked "Genuine Babbitt." It was bought in every part of the country, from New Orleans to Portland. Of the entire 40 there was one single sample which, by a stretch of courtesy, could be called genuine babbitt. I mean that described by Isaac Babbitt in 1839. I will, therefore, veuture the opinion that the mechanical builders of this country are not familiar with genuine babbitt. There are some men who have the skill to make genuine babbitt, and who use it, but they are very few, because the making of good babbitt metal is a very difficult thing—much more difficult than is commonly supposed. But if you put in the boxes under your trains a babbitt metal which does not contain the weakening influence of lead at all, the full amount of block tin of the best quality, only antimony enough to harden it, you get a metal, first, that no amount of hammering will heat, and second, which the ordinary acids of lubricating oils will uot affect, and the truck will run and keep perfectly cool. Isaac Babbitt himself, in his original patent, used fifty parts of tin, five of antimony and one of copper. Of course, the very great disadvantage of introducing any lead whatever in a soft bearing is the fact that the metal itself has no compression strain to speak of.

Progress of the Tehuantepec Railway.

In his June report the statistician of the Department of Agriculture makes a reference to the railway now in course of construction across the Isthmus of Tehuantepec under a concession held by Edward McMurdo of London. Only about 20 miles of the road in the center of the isthmus remain to be built, and the line is to be completed within a few months. Extensive works, estimated to cost $4,300,000, are being constructed at the port of Coatzacoalcos, the eastern terminus of the railway, with the view of providing a safe anchorage at that harbor for ocean-going steamers, aud a long iron pier will be constructed at Salina Cruz, the Pacific coast terminal of the road.

The completion of this railway line will provide a trade route between the United States and western Mexico, which will be more than 2000 miles shorter than the present route by way of the Isthmus of Panama. The ownership of the concession for building the railroad by a British subject might be a reason for apprehending possible discrimination against American commerce but for the fact that under the terms of the concession the line will become the property of the Mexican Government as soon as it shall have been completed.

THE following is given as an alloy to be used as "babbitt metal:" Block tin, eight pouuds or parts; antimony, two pounds or parts; copper, one pound or part. If this proves too hard or brittle, add some pure lead.

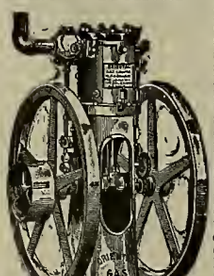
The Oriental Gas Engine



IS THE BEST, because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 22 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies. Stamp Cam.

DOUBLE-ACTING
Cornish ★ Plunger.

PUMPS TWICE AS MUCH WATER AS THE OLD PLUNGER. Only about one-third the weight of the old Plunger. Special construction of steel for packing on mules, only one-twelfth the weight of the ordinary Plunger. First outlay one-third less; works with 10 per cent less power.
IMPROVED SINKING PUMP.—Bucket and clack changed under water. Bucket lasts six times as long as the old one, saving expense of putting down another pump where bucket and clack cannot be changed under water. The self-tightening and self-lubricating stuffing box and new bucket also saves expense of dropping extra pumps. WM. NANCE, Grass Valley, Nevada County, California.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL MINING NEWS, *Ledger:* The reduction works of Voorhels and Barney, at Amador, have started up.

Stephen H. Emmens, manager of the Mayflower gold mines and of the Chicago gold-mining syndicate, has decided to establish a weekly pay-day.

The South Spring Hill people are repairing their rock-breaker and mill property, to crush ore from the Median.

At the Bay State mine the crosscut from the 500-foot level was carried in 73 feet, when the ledge was struck. After that, drifting north and south on the ledge from the crosscut was pushed forward for about 35 feet each way. The ledge was then prospected and at the south was found to be four feet wide, carrying $4 ore. At the north the ledge was eight feet wide, carrying $30 ore.

PIONEER DISTRICT. Whitehead and Walker are working the McLaughlin gravel mine, near Aqueduct.

The Cook mine, at one time the property of Captain Coolidge of Sutter Creek, a gravel proposition, located at Clinton Bar, is being worked.

The Contention mine, which was formerly the Belden, near Stirmanan's ranch, is being worked through a 270-foot tunnel by J. Bannershine and Thos. Severance. The rock they are taking out will go $35 a ton.

Charles Gracey, who is working the Pioneer mine, has six men at work cross-cutting for the Griesbach ledge in the 200-foot level. He is using the hoisting machinery of the defunct Irma, but has discarded the compressor and machine drills, claiming that in the rock he can make better progress, at less expense, by hand.

A. W. Kimball, owner of the Dead Sheep mine, is at work on his property. He has his shaft down 175 feet, and expects to erect a hoist and engine. The ledge upon which he is going down is 24 inches in width and will produce $100 a ton.

At the Wildman mine, work is progressing. At the 1200 and 1300 levels the ledge continues to improve in both size and quality of the ore as the south drifts are extended. The thirty stamps in the mill are pounding away on ore of good quality taken from the drifts alone, no stoping having yet been done.

The Big Tunnel Co. cleaned up a short time ago something in the neighborhood of $30,000. They have suspended operations recently, as it is their custom during the hot weather.

Operations are still going on at the Fogus mine. This was an old abandoned mine, and recently parties who had not lost faith in the mine commenced to open it up. Supt. Moore has just returned from the Bay, where he has been transacting business for the mine. McGhee, the foreman, is having the work executed as vigorously as possible. They labor under a great many disadvantages, but as soon as the old mine is thoroughly renovated they will commence to take out rock.

Nevada.

QUARTZ PROSPECTING.—*Telegraph:* There is now considerable quartz prospecting going on up in the vicinity of San Juan, French Corral and other points about the ridge. Especially is this the case at French Corral, on the Milton Company's ground. There are a number of quartz ledges upon the property and Chas. L. Miller thinks favorably of them. He has erected a three-stamp mill, which is being kept running on quartz taken from different ledges on the Milton property, and we learn that the results so far are good. Mr. Miller expects to find a paying mine out of some one of the numerous quartz ledges there. Others who have quartz locations up there will also have test crushings. The Milton has already a mill running to crush the rich gravel in the diggings.

Placer.

Sintinel: At the Golden Shaft, Mr. E. Mallows is putting in a steel skip for hoisting gravel, is grading in the mine for running a car and otherwise putting it in shape to drift. This week new hoisting works are being put in place. About 600 feet of pipe are being laid in order to secure the necessary pressure to run the hoisting works. Everything looks very promising in the drift, the last prospect being the best yet. The gravel is softer, the last gravel taken out going at the rate of $20 a carload. The drift run from the shaft is now about 85 feet in length and for the last 50 feet has prospected well.

At the Mayflower mine, near Forest Hill, a large force of men is employed. The Mayflower is one of the best mines in the State, and is the scene where drift mining is conducted on the most extensive scale in California. They have discovered a new channel of gravel at a depth of about 169 feet from the surface. F. Chappellet says that it only takes about 1400 feet of tunnel to work the newly located channel, and that he will complete arrangements this week whereby active work looking to the handling of this gravel will be commenced. He has always had faith in the existence of this gravel, and believes it to be an extension of the old Paragon channel which was worked with immense profit at Bath. The blue lead is being worked successfully by the Mayflower Company, but the discovery of this new and promising gravel channel is like finding a new mine.

ARIZONA.

Humbug District.

Phœnix *Herald:* The Humbug mining district is rapidly coming to the front as one of the richest in the territory. The Golden Cliff Gold Mining and Milling Company was recently organized for the purpose of developing and mining six claims in that district which are said to be very rich. They are free-milling properties, and the company is now negotiating for a 50-stamp mill which will be placed on the claims and active operations commenced. The claims are high grade and average $80. Samples from the properties have been taken East, and, when the real value of the claims is determined, a large force of men will be put to work and the mines developed. There are a number of other rich claims in this district which have been worked at a profit for years with arrastras; and now that improved machinery is going in and men of experience and money taking hold, it will not be very long before that district will take a place at the head of the gold-producing districts of the Territory.

MOJAVE COUNTY, Kingman *Miner:* It is reported that the old Josephine mine at Mineral Park is producing some of the richest ore ever taken from that property.

H. P. Ewing has purchased the Dodge mill formerly used at Needles. Tuesday he went up to Hackberry and purchased the hoisting engine and boiler on the old Hackberry mine. The machinery, so we understand, will be put up on the Tuckahoe mine at Chloride.

THE GOLD BUG MINE.—The Gold Bug mine is situated about 50 miles northwest of Kingman, in Minnesota district, and has been worked continuously from the date of its location, producing many thousands of dollars from its ores. After passing into the hands of the Gold Bug Company many improvements have been made in and around the mine. A hoist of the latest improved pattern has been running for the past year on the property, and bunk houses, reading rooms, offices and boarding house have been erected, making it one of the cosiest little camps on the coast.

The main vein has been opened up by two shafts to a depth of 250 and 120 feet. The hoist is erected on shaft No. 2, and the same cable is used in hoisting from shaft No. 3 on another vein. A crossent at the 70 level of No. 2 shaft opened up a strong vein of very free milling ore, an average sample of which ran $20. The place from which the sample was taken was fully five feet in width. Drifts have been run 50 feet on this vein, and it is fully as strong in the face as where first cut by the crossent.

From shaft No. 3 has come the richest ore in the camp. Twenty tons recently shipped to Denver netted $4500, and 17 tons of the lower grade gave a cleanup of $750 at Brown's mill on the Colorado river. The ore milled on the Colorado was crushed in a Huntington mill and run over plates. The small percentage of iron pyrites was saved on concentrators. By this method the precious metals in the ore can be saved up to at least 95 per cent.

There being no water in any of the workings the camp is supplied by a 500-gallon tank, which is kept on the road most of the time. An atmospheric condenser, designed by W. F. Crosby and built by the Trenton Iron Works of New Jersey, saves 80 per cent of the water from the exhaust steam, which is a great economy, both in the expense for water and fuel. The condensation of the steam so purifies the water that all scale is prevented from forming in the boiler, an advantage which all steam users in this "hard-water" country will not be slow to appreciate, since even a slight coating of the non-conducting lime salts greatly adds to the fuel bill. This condenser is the first of its kind ever introduced, and Mr. Crosby has originated a valuable and money-saving improvement which is designed to become an essential part of every steam plant in this desert land. Not the least of its good points is that it heats the feed water without any consumption of available heat. A thorough system of ventilation is possible in connection with the condenser, which every mine of any extent should have in this hot country.

The mine is being thoroughly developed before a mill will be erected on the Colorado river, some ten miles away. In every opening a good grade of milling ore is shown, some of it running away up in the hundreds, and the greater portion giving an average value of from $20 to $30 per ton.

MONTANA.

MINING NEAR MISSOULA. — *Miner:* The placer mines in the Nine-Mile, Cedar and Quartz creeks and other placer-mining sections of the country, report an unusually active season. Great amounts of gravel are being handled in the large flumes, and the fall cleanups are expected to exceed any of recent years.

The area of placer ground in the western portion of Missoula county is very large, and there is still room for the development of this industry to a much larger extent than is done at present.

The gold-quartz mining interests, requiring more capital, are slower in advancing to a producing basis and are in a much more promising condition than in any previous year.

The San Martina Mining Co., operating properties on Nine-Mile creek, has ordered a five-stamp water-power mill and will probably have it running by the latter part of August. This company owns seven claims, forming a block of ground joining that of the Nine-Mile Mining Co., on which latter a 20-stamp mill is now being run.

On the Giant, one of the San Martina Co.'s claims, very rich float was found some three years ago. Much work and money were expended in an endeavor to find the ledge from which this rich rock was supposed to have come. Several tunnels and a number of shafts were driven, and although two or three ledges were discovered the managers were not until last spring satisfied that they had found what they were looking for. At this time a ledge was uncovered which has since been demonstrated to be the one sought. Recent developments have proved that one of the former tunnels, if it had been driven 10 feet farther, would have cut the vein and the suspense would have been ended much earlier. The ledge has now been driven on for over 100 feet and shows a vein of ore from two to six feet in width, car samples of which have averaged $20 in gold. As the ore is free-milling and the natural facilities for economical working are excellent, the stockholders feel that the long period of "lrish" dividends has about ended. The Grouse, which is also owned by the San Martina Co., shows a large body of free-mill-ore of a somewhat lower grade.

On Deer creek, a tributary of the St. Regis, Charles Wing is opening up the Oro Fino mine and will erect a mill this summer.

On Deep creek, which empties into the Missoula river eight miles west of Nine-Mile station, William Beach is working a force of men on several quartz properties owned by Butte capitalists. Very favorable reports are brought by those who have seen them, and it is understood that a mill will be built in a short time.

The managers of the Landowner Mining Co., whose claims are located in Windfall gulch, in the Trout creek district, will put a force of miners to work in a few days.

The Charcoal mine at Camas Prairie is shipping ore and making money for its owners.

The Iron Mountain will start its concentrator in a few days.

In fact, notwithstanding the general depression in the silver-mining interests, there are probably as many miners employed in the vicinity of Missoula as at any time during the past few years.

A PROMISING PROPERTY.—Supt. Ewing and R. R. Geery came in lately from the Massachusetts and Montana Gold Mining Co.'s property, in the Lowlands, and brought with them a 15-pound lump of amalgam and $400 worth of dust, taken from the boxes without making a cleanup, after 15 days' work. The reservoir of the company has given away several times lately, showing that the company is well supplied with water. About 1500 feet of flume has just been completed and the company purposes to soon commence operations on quartz.

THE COPPER PRODUCERS.—*Inter-Mountain:* The shaft of the High Ore No. 2 has now passed the 500-foot mark, and sinking is still actively progressing. A 22x40 hoist will shortly be placed in position to develop this property to the 2000-foot level. A station is cut at the 400, upon which pumps will be placed, but no crosscutting will be commenced until the 1200 level is reached. This will be the top working level of this property. It is the intention of the Anaconda Company to develop the shaft of this mine to the 4000 foot level, before the work of extracting ore is begun, and when completed it will be one of the deepest shafts in the world.

About 30 miners are employed at the Rarus, which is now being operated by the owners. This is one of the very finest properties of the district, and additional development work shows up larger and richer ore bodies. The present production of ore will average about 2000 tons of ore per month, of which about 600 tons are first-class. The property can easily yield 250 tons of copper ore per day, and it is the intention of the owners, if the copper market warrants it, to put on a force of 60 or 70 men in a short time. The ore is being shipped to the Heinze smelter.

The Jennie Dell would be considered a good gold mine in any country. It has four feet of a ledge which will average 353 ounces in silver and $148 in gold. Ore is now being hoisted from this property through the Evelene's shaft, for which a royalty of $500 per month is exacted. The shaft of the Jennie Dell is developed to the 240-foot level. Water in large quantities has been encountered and occasions considerable trouble.

The Nora mine and adjoining claim, the Lucky Jim, owned by Messrs. Cassaday, Stapleton, Roach and others, and formerly worked by W. A. Clark and the Butte and Boston, are now under lease and bond to Pat Mullin. Mr. Mullin has erected a hoisting works with the necessary machinery for its development at a cost of about $10,000, and will at once begin work. The shaft will be developed to the 500-foot level, at which level crosscutting will be commenced on the south side of the shaft to reach the lead. The Nora adjoins the Harris & Lloyd tunnel on the south.

The continued operation of the Parrot smelter is threatened by the strike on the Great Northern. About a week's supply of coke is usually kept on hand, and when this is exhausted there is a liability that no more can be obtained until the strike is ended.

W. L. Ledford, who has the lease on the copper-saving process of the water from the St. Lawrence and Anaconda mines, was offered a large sum recently for his lease, but he refused to accept it, believing that he can do better by holding on to it. Most of the other leasers south of him are not doing much more than making expenses.

Patrick J. McCleary has entered suit in the district court against Arthur H. Hedley for $6,500 commission, which he alleges is due him for effecting the sale of the Golden-Sunlight group of mines near Whitehall. Hedley is one of the original locators of some of the claims of that group, and McCleary alleges in his complaint that in July, 1892, he entered into an agreement with Hedley to find him a purchaser for the property. He says he induced Bernard McDonald of the American Developing and Mining Company to visit the property, with the result that a sale was effected, the purchase price being $65,000. Mr. McCleary says he was to receive 10 per cent commission for making the sale, but after the deal had been consummated Hedley denied his liability to the plaintiff.

NEW MEXICO.

Grant.

GOLD HILL.—*Enterprise:* Tom Holman is working 51 men upon the Golden Grant mine. The shaft is now 300 feet deep, but levels have not yet been driven at that depth. The ore being extracted is taken from the 200 and 250 levels. The stopes are 400 feet in length on each side of the shaft and the ore body continuous throughout the entire distance of 800 feet, besides showing well at the end of each level. A cleanup was made at the Pacific mill last week with returns of 195 ounces in gold from 193 tons of ore, besides which there were shipped 22 tons of concentrates that will average two ounces in gold per ton, bringing the average value of the ore to about an ounce and a quarter of gold per ton. The Mammoth mill will finish cleaning up on the Golden Giant ore this week, on a mill run of 245 tons. From indications, the cleanup was about 220 ounces, beside a 25-ton lot of concentrates. The entire cleanup from both mills was about 385 ounces of gold from the plates, and 45 to 50 tons of concentrates.

UTAH.

A GOLD FIND. — *Tribune:* The people of Manti are greatly excited over a gold find at Salina canyon. Assays show over $75 per ton. The claims are placers in black sand. Several locations are made and more are rushing to the find. A new mining district has been formed, called Red Creek. William Funk is Recorder.

The town of Sterling is almost depopulated. The citizens of Manti and Salina are going in dozens. Men are employed, lumber is on hand and sluicing operations are beginning. The gold is fine and clearly visible to the naked eye.

The find is about 35 miles southwest of Salina. The field contains three miles of placer ground.

WASHINGTON.

TO OPEN NEW MINES.—Spokane *Chronicle:* Charles L. Knapp, Warren Russell and a number of miners started to the Slocan district this morning for a summer of hard work. A complete outfit, including tents, tools, provisions and camp equipments was shipped north yesterday. They go to open the rich Ruby Silver and Keno mines, and may also begin work on the Tiger before the summer is over.

It is estimated that the ore from the Ruby Silver will net $100 per ton even at present prices, after paying all the cost of mining, freight and treatment. With fair prices for silver it would net $200. The working force will be increased to 50 men, and the company may put on its own pack train to handle the ore. Shipments will begin about August 1st, when the new lead tariff of three-fourths of a cent is expected to take effect. It is rumored that the ore will not pass Spokane but will be treated here.

Other Slocan mines are livening up again. The summer supplies for the Bluebird were packed in last week. The Chicago company that purchased the Surprise will begin work at once. The owners of the Grady group have let the contract for handling 1500 tons of high-grade ore. A man is now in the city buying horses to put in a new pack train from the mines to Kaslo. And so it goes.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 26, 1894.

522,039.—TREE TRANSPLANTER—H. Baldridge, Los Angeles, Cal.
522,142.—SEAT—O. L. Barrett, The Dalles, Or.
522,102—MOTOR—C. E. Brown, Stayton, Or.
521,845.—NUT LOCK—J. C. Brown, Santa Barbara, Cal.
522,106.—BOXING GLOVE—Carson & Martin, S. F.
522,107.—CAN TESTER—J. B. Clot, S. F.
521,783.—CONDENSER—C. S. Cox, Spottiswood, Cal.
521,852.—STREET SWEEPER—P. B. Donahoo, S. F.
521,853.—BROOM MAKING MACHINE—P. B. Donahoo, S. F.
521,785.—CUTTING METAL BARS—W. F. Evorett, Reno, Nev.
521,883.—EXCAVATOR—H. P. Holland, S. F.
522,074.—MUSIC LEAF TURNER—F. A. Meyer, S. F.
522,086.—HARROW—Jas. Porteous, Fresno, Cal.
522,028.—PURIFYING OILS—W. B. Price, S. F.
522,126.—HORSESHOE—J. H., J. R. & W. E. Smith, Snohomish, Wash.
522,171.—REFERENCE FILE—W. L. Van Harlinger, Oakland, Cal.
521,905.—EXTENSION TABLE—Young & Mathews, Seattle, Wash.

FOR WEEK ENDING JULY 3, 1894.

522,447—GAGE FOR MANIFOLD APPARATUS—L. M. Bannan, S. F.
522,285—TYPEWRITING MACHINE—C. H. Boynton, Oakland, Cal.
522,452—PILOT BAR LIFTER—Cotter, Holladay & Duncan, Yuma, A. T.
522,462—LAMPLIGHTER—F. Fergnson, Soattle, Wash.
522,205—TRACK CLEANER—Harris & Allen, Vale, Or.
522,342—HOSPITAL BED—A. Helander, Los Angeles, Cal.
522,260—PROCESS OF EXTRACTING GOLD, ETC.—W. D. Johnston, S. F.
522,283—GAS GOVERNOR—W. O. Lndovici, S. F.
522,268—GAS TRAP—J. McKellar, S. F.
522,488—AMALGAMATOR—E. J. Powell, Sunny South, Cal.
522,276—ARC LAMP—A. W. Smith, S. F.
522,444—STEP-LADDER—B. A. Wright, San Jacinto, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

THE N. Y. *Electrical Review* learns that negotiations are pending between the Manhattan Elevated Railway Company and the General Electric Company for an electrical plant to take the place of the steam locomotive system now in use upon the elevated railways of New York City. The detailed estimates of the General Electric Company have been figured out to aggregate $8,000,000, which is regarded as excessive.

Electrical Progress.

Electricity in Colorado Mines.

Tunneling in several silver mines in Colorado is being given unusual prominence by the general adoption of electrical power therein. Among several referred to by an Eastern exchange is the Revenue tunnel, near Ouray, Col., in the Virginius mine, one of the highest silver mines in the world. The original workings were 12,500 feet above sea level, and over 1000 feet above timber line. During its best years 350 meu were employed in and about the mine, and a postoffice for their convenience was established in the settlement of mining cabins perched upon the steep mountain side. During the winter season the miners were separated from the world for several months, though occasional trips on snowshoes in favorable weather were made down to the mountain-walled, unique town of Ouray, seven miles below.

When the present owners purchased the Virginius, the privilege of working the mine from the adjoining property was denied them, so that from the outset they had to expend money in developing their property. For 13 years they prosecuted the work. The Virginius mine has been worked through a crosscut tunnel which burrowed into the mountain a distance of 400 feet. At that point a shaft was sunk upon the vein. The top of the shaft is 300 feet vertically underground, and it is 1400 feet in depth. In the crosscut 100 feet in from the entrance a large room was hewn out of the solid rock to contain the battery of boilers, of which there are three, each of 60-horse power. To get this heavy machinery up from the railroad a wagon road had to be constructed to the entrance. The smokestack rises through solid rock upward of 300 feet to the surface, where it projects a few feet into space. Electricity has been called into use to facilitate the enterprise. Four and one-half miles away up Canyon creek, Pelton water wheels, working under a 525-foot headway, operate the dynamos that generate the electricity, which is wired dowu to the mine. The current operates electric pumps with a capacity of 200 gallons of water per minute, besides furuishing light to all portions of the property. The hoists are also worked by means of the electric current.

Another similar enterprise is the Newhouse tunnel now being driven into the mountains at Idaho Springs. Three years ago Samuel Newhouse of Denver, who had been engaged about mining camps for 15 years, and was the pioneer tranportation man in the Leadville rush, conceived the idea of constructing a tuunel to tap at a great depth the veins of gold in Gilpin county. His idea was to construct a subterranean railroad, with the gold ores of Gilpiu county as the freight to be transported. The tunnel is uow a thousand feet long. The great rounded hill known as Seaton mountain, where Russell gulch has its source, and where the mining camp of Nevadaville clusters, is the territory to be reached by this underground railway. Within this massive granite mountain there are over 300 known veins of gold-bearing mineral. The cost of operating the mines is considerable, for water has to be overcome by means of expeusive pumps, coal must be carted to the mines, shafts sunk, machinery purchased and renewed as greater depth is attained, and the ore transported from the shaft to the mills situated dowu in the valley. The California mine, now at a depth of nearly 2200 feet, is operated through a single shaft just large enough to permit a cylindrical bucket to be lowered, and through this small opening the miners must go and the water be takeu out before the precious mineral can be brought to the surface.

It is under this territory that the Newhouse tunnel is to be driven with the purpose of crossing these veins. The total length of the tunnel as projected is 20,000 feet, and it will cross the California mine vein at a depth of 2000 feet from the surface. By this tunnel a complete drainage scheme is assured to all the mines, the cost of transportation of ores will be reduced to a minimum, and, instead of expensive machinery to hoist the waste and the mineral, gravity mining can be carried ou. The mouth of the tunnel is at Idaho Springs. The breast of the tunnel is 12x12 feet, rising at a regular grade of six inches to 100 feet. Its course is a true tangent. The tunnel will have a double track laid with 30-pound rails, with drainage canals alongside, and the transportation of materials in and of ores out will be done by electricity. The tunnel will be lighted by electricity.

In Leadville several underground tunnels have been constructed in the past to save expense in operating some of the deep mines, but no public highway underground was attempted until this spring. Now the Silver Cord tunnel is to be driven under Breece Hill to tap the newly developed gold deposits. Another enterprise, which is still almost visionary, is a gigantic drainage tunnel to be run from the Arkansas river under the hills for several miles to reach the entire Leadville district at a low depth and thoroughly drain the entire territory.

Transportatiou tunnels in miuing districts are proposed upon smaller scales in nearly every camp in the State. As soon as a mine has shown by development that it is a productive property, with a continuous vein of ore of known value, the owners begin to plan a crosscut tunnel in order to reduce the operating expenses to a minimum.

Electricity and Oil in Warfare.

In the *Atlantic*, J. L. Brent writes on "War's Use of the Engiues of Peace," and proposes some uovel defensive and offensive plans. He points to the ineffective results of the usual attempt to close up waterways with laud batteries—a means which failed in such notable instances as at the Mississippi mouth in the Civil War and later at the port of Rio Janeiro in the Brazilian struggle just ended.

Torpedoes should be and are used, but they are not final, and it seems to this writer that a British force might annihilate the great cities of our northern boundary by steaming down the Canadian waterways.

Electric currents of enormous energy, capable, under the coudition of actual contact, of destroying life in any number of men exposed to it, and possibly ships of war also, can be generated at points 30 miles or more distant from the localities where they are expected to be used, and be transferred there with inconsiderable decrease of power. Inflammable oils can be conveyed through pipes by gravitation, or pumps working, if necessary, 20 miles from point of discharge, and after discharge can be instautaneously ignited whenever desired, and, when discharged upon or under water, will float aud burn upon its surface.

Thus, electricity and inflammable oils meet the primary consideration of possessing centers of supply and activity remote from the enemy, and of developing powers capable of almost instantaneous transmission to points where they could operate effectively against an enemy, with a continuous renewal and supply of power; and therefore currents of electricity and inflammable oils, separately or jointly, are well adapted for use in defensive war.

In fighting on land Mr. Brent would have his electric batteries carried on railroad trains, arguing that as things are now, all important campaigns are conducted in close conuection with transportation lines.

QUICKSILVER!

—FOR SALE BY—

The Eureka Company,

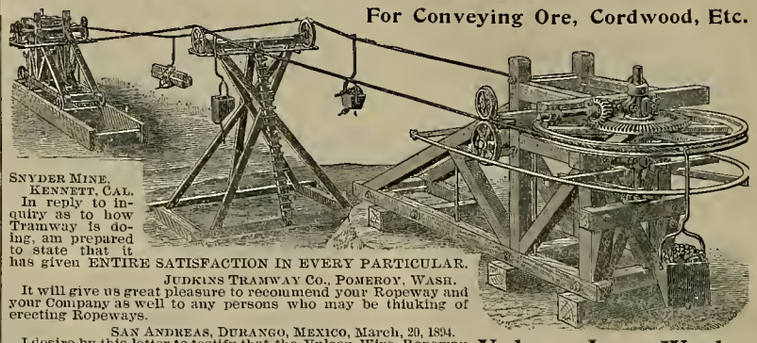
OF SAN FRANCISCO.

ROOM 1. - 426 CALIFORNIA STREET, SAN FRANCISCO.

Stamp Mills!

VULCAN WIRE ROPEWAY

For Conveying Ore, Cordwood, Etc.



SNYDER MINE, KENNETT, CAL.

In reply to inquiry as to how Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR.

JUDKINS TRAMWAY CO., POMEROY, WASH.

It will give us great pleasure to recommend your Ropeway and your Company as well to any persons who may be thinking of erecting Ropeways.

SAN ANDREAS, DURANGO, MEXICO, March, 20, 1894.

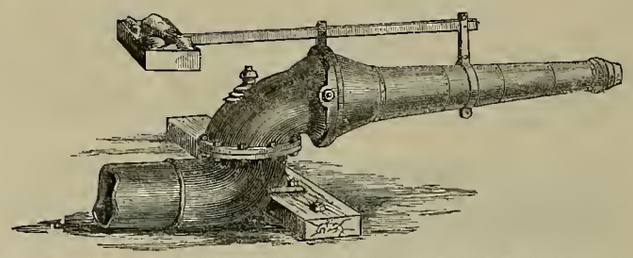
I desire by this letter to testify that the Vulcan Wire Ropeway furnished to this Company by your Works, and erected by your engineer, B. McIntire, is of the very best class, and has given us entire satisfaction since its installation.

ANTONIO H. PAREDES, Director S. A. de la S. M. Co.

Vulcan Iron Works,

135-145 Fremont St., San Francisco.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

The Blasdel Concentrating Belt Co.

WE are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Practical Information.

The Fatigue of Metals.

A correspondent of *Knowledge* shows that the phenomena of muscular fatigue correspond very closely to the fatigue of metals. Fatigue of metals—a phrase which has come into use only in recent years—describes a condition of the material not previously understood. It expresses the straining of the relationship to each other of the molecules of which the metal is constituted, a meaning which the term weariness, or literally wornness, does not convey. Engineers are familiar with the facts that parts of machinery break down after having worked satisfactorily, and apparently with safety, for months, or it may be for years. The cause of such breakage, once a mystery, is now known to be fatigue. This principal is illustrated in the breaking of a piece of wire. It is bent backward and forward until rupture takes place—from fatigue.

If, however, metals are strained beyond the elastic limit, but not broken, and if the straining is not continued, the material will recover its elasticity by rest alone. Prof. B. W. Kennedy has clearly demonstrated this recuperative property of metals. Bars of steel and iron strained in a testing machine beyond the elastic limit, and so weakened thereby that if they were tested again the following day they would take permanent set at one-third or less of their former load, would, if allowed to rest for about two years, be found not only to have recovered their elastic limit of strength, but to have exceeded it and to have become stronger than before in the direction in which they had been pulled. If the period of rest was materially shortened, the restoration of strength was found to be correspondingly incomplete.

This theory of fatigue holds good in regard to muscles as well as metals. Prof. Michael Foster pointed out last year that the muscles in the leg of a frog severed from the body, and caused under electrical stimulus to exert themselves in work until thoroughly wearied, and no longer able to respond to the electrical excitation, will, with rest alone, recover their elasticity and be able to resume work as before. Prof. Foster demonstrated that the weariness was in the muscles and not in the nerve. The worn tissue could not, of course, be restored, but from the fatigue the muscles did recover, and it is clear that the fatigue which we experience in our own bodies must be largely fatigue in the technical sense, in addition to weariness proper or wornness. Rest is therefore required, not only to enable waste tissue to be restored by fresh material from the blood, and by the carrying away of waste material, but also to afford opportunity for the strained molecules to recover a state of repose.

A New Solder.

F. Walter has found that an alloy consisting of 95 parts of tin and five parts of copper adheres so tenaciously to glass that it may be employed as a solder to join the ends of glass tubes. It is obtained by adding the copper to the tin previously melted, agitating with a wooden stirrer, casting or granulating, and then remelting. It melts at 360 degrees C. By adding ½ to 1 per cent of lead or zinc the alloy may be rendered either softer or harder, or more or less easily fusible. It may also be used for silvering metals or metallic thread.

Sanitation by Sea Water.

The new system of sanitation adopted in Havre—based upon the electrolysis of sea water—has proved a gratifying success. The electric current decomposes the chloride of magnesium, while the chloride of sodium serves as a conductor, the result being a liquid disinfectant of great power, being almost odorless, leaving no residuum when used for purposes of flushing, and is entirely inoffensive. The solid matter in sewage is instantaneously consumed in this solution, as well as the organic matter, what is left being simply an odorless and troubled liquid, incapable of fermentation, and containing only a few phosphates—the salts of ammonia and the salts of the disinfectant. Of the two classes of microbes anærobic organisms, requiring air to live, the action of this chloride compound on the first is simple, for, as they cannot live in the presence of oxygen, their extinction is swift and sure. The destruction of the microbes which require free oxygen to support life is equally certain.

During the fiscal year ending June 30, 1893, a total of 502,917 immigrants of all nationalities entered the United States, a decrease of 120,167 from the preceding fiscal year. Europe sent 488,832; Asia, 6999; the West Indies, 3159; Oceanic, 2665; South America, 610; and Africa, 327. Germany continues to send the largest number of immigrants, having contributed during the last fiscal year 96,361; Italy comes next with 71,145; Ireland with 49,233, and England with 46,501, the total for the United Kingdom being 109,086. Russia decreased her population by sending us 37,177 of her people, and Austria-Hungary furnished 59,633. Compared with 1892, the falling off was over 50 per cent for Russia. Germany, Italy, Ireland and England furnished a much smaller number of immigrants, while the figure for Poland fell from 83,299 for 1892 to 13,664 for 1893.

If 20-story buildings become a popular feature, the electric arc light will be needed to recompense for the light of day thus shut out in all the streets of the city.

Market Reports.

The Markets.

SAN FRANCISCO, July 19, 1894.

It would be as well to stereotype the figures "62" for the price of silver and avoid setting it in type, that being the steady quotation with slight fractional addenda for the last few months. During the 202 days of '94 the highest New York quotation of silver was 69 in January, the lowest 61¼ in May. During the corresponding period of '93 the highest and lowest were 84⅛ and 72. Bar silver is bought in New York for London account, and that is argued as indicating that the Indian mints are to be reopened. It is not considered altogether likely. India's purchases are believed to be more for absorption than circulation. From January 1st, '94 to June 15th—our latest mail advices—London shipped silver to the value of $24,418,974 to the Orient. San Francisco should have the shipment of this amount, and nearly all other amounts, being the natural distributive point for silver to India, China and Japan. The way to bring it about is to induce silver bullion shipments here from all parts of the west half of America.

Regarding copper, the selling agents for the Montana group of mines and Lake mines, a combined output as large as the Calumet & Hecla, say: "We are not selling a pound of copper below 9⅛ and 9¼ cents. The only reason we know for the recent sale by the Calumet & Hecla at 9 cents was that it had a big block of copper on hand which it could get rid of in no other way. The demaud for copper is quiet at the moment, but as soon as general business revives, electrical construction work will naturally be renewed, creating a demand for copper for home consumption, which necessarily will advance the price."

Quicksilver is still as mercurial in its tariff disposition as in its own make-up. In the closing days of '93 the price fell to $30 a flask in fear of the free list. If the tariff bill goes through, which is very doubtful, there will be a duty of about $5 a flask. The probability of such a consummation has kept the price up to $35.75 and $36, with a commensurate reduction for export. Europe yielding 68 per cent of the world's product makes foreign competition almost prohibitory to American mines, and nothing stands in the way of a crippling of the California quicksilver industry but the seven-cents-a-pound duty that it is hoped the House will have the sense to retain.

New York Prices.

NEW YORK, July 19.—Following are the closing prices for the week:

	Silver in London.	N. Y.	Copper.	Lead.	Tin.

Mining Share Market.

SAN FRANCISCO, July 19, '94.

There was a little ripple in the stock market during the week, but not as much of a breeze as was expected to follow the dead calm of the week before. A report of a valuable find in the Crown Point held up the south end shares. Con. Cal. and Virginia doesn't seem to be as buoyant as boped for. It is thought the yield of the mine for the fiscal month will be about $90,000, fifty per cent of which is gold. The Crown Point ore in the recent milling test at the Mexican mill gave a return of $10 per ton. There were 1054 tons concentrated, yielding $10,340.88. To mine it cost $4 per ton, to haul and mill it, $2.65, making $7 an outside cost. There is plenty such ore in the upper levels of the Comstock, and if it averages so well all through, a profit of $3 per ton is not to be despised these days.

The Standard Mining Co. will pay a 10-cents-per-share dividend next Wednesday.

The Virginia Miners' Union has elected F. H. Johnson president, J. J. Quinlau vice-president, and John F. McDonald financial and recording secretary.

The Omaha Consolidated G. M. Co. of Grass Valley has declared its regular 15c-per-share dividend, payable immediately.

At the annual meeting of the stockholders of the Union Con. the following officers were elected: Charles H. Fish, president; Charles Hirschfield, vice-president; and W. S. Lyle, A. K. P. Harmon and A. G. Gurnett, directors. C. C. Harvey was re-elected secretary. His balance sheet showed a credit of $3733.08 on the 1st; 9787 shares were represented.

The Live Oak Consolidated Gold Mining Company of Nevada county has levied an assessment of ten cents per share, delinquent on the 30th.

The New Almaden Quicksilver Mining Company of Chihuahua, Mexico, has levied an assessment of 12½ cents per share, delinquent August 15th.

The Sierra Nevada Mining Company has levied an assessment of 25 cents per share, delinquent September 11th.

The Gray Eagle Miniug Company has levied an assessment of 5 cents a share, delinquent August 24th.

The Overman Mining Company has levied an assessment of 10 cents per share, delinquent September 11th.

The San Vicente Miniug Company has levied an assessment of 12½ cents per share, delinquent August 6th.

The following illustrates the changes of the week:

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of speeial mention:

BOXING GLOVE.—R. M. Carson and A. A. Martin, San Francisco, Cal. Assignors to the E. T. Allen Company. No. 522,106. This invention relates to improvements iu boxing gloves. It consists iu forming the back broadest in the center, tapering toward the end of the fiugers and toward the wrists, and a palm piece to which the back is stitched so as to form a curved segmeut when the glove is finished, and by which it produces a permanent normal curvature from the wrist to the fiugertip, while the thumb is adapted to fit into the palm in opposition to the hngers, and bas a reinforce strip extending continuously from the palm up the inside of the thumb. By this construction the glove is nominally in a closed position and is relieved from strain and danger of tearing which results from the forcible closing of a glove that is normally open wheu not in use.

MUSIC LEAF TURNER.—Frederick A. Meyer, San Francisco, Cal. No. 522,074. Dated June 26, 1894. This invention relates to an apparatus which is adapted to turu the leaves of sheet music up to any desired number, to turn the leaves back again for the purpose of repeating, either from the beginning or from auy point iu the piece, and a means for adjusting the arms which carry the leaves to suit the size of the leaves. It consists of a series of flat plates journaled to turn about a central post having upwardly and outwardly turned arms adapted to carry indepeudent leaves of music, a drum turnable about the ceutral post having a cord wound around it by which it is turned to the left, a spring contained within the drum by which it is normally beld at the right side, and a semicircular horizontal ring below the drum with a vertical block sliding loosely through the extension of the drum at one side, having a lug or lugs adapted to engage the turning plates below tbe ring, whereby they are turned successively from right to left, and a returning plate connected with the lower drum, with mechanism whereby the operation is reversed so that the leaves may be returued to their original position either all together or a certain number if it is desired to repeat a part of the piece of music.

HARROW.—James Porteous, Fresno, Cal. No. 522,086. This iuvention relates to a harrow in which the beam and handles have journaled to them a circular rotary frame, and its object is to provide a means for keeping the teeth tight, and providing for replacing the teeth and tightening them without the assistance of washers or wedges. It consists of a harrow tooth having a tapering point, a body of substantially uniform cross section, the corners of the body being chamfered, with bevels increasing in width and depth from the upper end downwardly, and adapted to fit the holes in the frame bars in such a manuer that they may be tightened in the holes and firmly locked in place.

AMALGAMATOR.—Edward J. Powell, Sunny South, Cal., assignor of one-third to H. T. Powell of same place. No. 522,488. This invention relates to an improved apparatus for amalgamating and saving precious metals. The object of the invention is to provide an apparatus in which the pulp is carried over suitable amalgamating and arresting surfaces in a thiu sbeet, and in a means by which the material is beaten or forced down into contact with the amalgamated surface to insure its arrest. This is carried out in various ways. The preseut invention is shown as applied to a shallow circular pan having the bottom covered with amalgamated copper or silvered plates. A vertical shaft arises through the center of the pan with suitable gears for driving it, and upon radial arms projecting from the hub are flexible sheets which drag over the surface of the amalgamated plates in the direction of travel, thus insuring the contact of all the material with the amalgamated plates. A series of riffles are arrauged around the pan, decreasing in height from the outside toward the discharge opening.

GAUGE FOR MANIFOLDING APPARATUS.—L. M. Bannau, San Francisco, Cal. No. 522,447. The object of this invention is to provide an easily adjustable gauge against which sheets to be printed upon are placed while the frame is opened, and a means for directing the gauge points as soon as the frame is closed for the purpose of reproducing the letter or other matter. It consists of a bed adapted to receive the sheets from which the coppy is to be taken, having slots or channels made through its surface, bars extending in line beneatb said bed, and hinged to one end of its frame, adjustable slides fitting said bars having upwardly projecting gauge pins extending through tbe slots so that the sheets are accurately placed upon the bed, and a frame hinged to the bed adapted to close down over it after tbe sheets are in place, a lever hinged on oue side of the bed having a pin which is engaged by the hinged frame when the latter is closed and the opposite end of tbe lever engaging the lever upon the gauge carrying bars, whereby the gange pins are depressed beneath the surface of the bed when the frame is closed, aud a spring by which the bars and gauge pins are elevated when the frame is opened again.

Wanted, Good Mining Properties.
Owners wishing to sell should communicate direct with J. GRIFFIN, room 32, fifth floor, Mills Building, San Francisco. Principals only dealt with.

Coast Industrial Notes.

—The Tacoma, Wash., Inter-State Fair will open August 15th.

—The Unica Iron Works is building a mammeth steel tank for the new Spring Valley reservoir on Clarendon Heights.

—The Puget Sound Pulp and Paper Company, Everett, has filed articles of incorporation increasing capital stock to $560,000.

—The Northwestern Milling & Power Co., recently incorporated with $750,000 capital at Spokane, Wash., to operate mills, electric lines, etc., is pushing operations in its section.

—As a result of Secretary of the Navy Herbert's recent visit here, he is about to issue orders directing the Monterey to go to Seattle and take coal there to give it a thorough test.

—The new power house at 11th and Bryant, for the electric roads of the Market Street Railway Company, is finished. The system will be in operation on Mission, Third, Brannan and other city streets about September 1st.

—The oil steamer Baunmore, of J. W. Grace & Co., is on the dock to have her tanks rid of gases generated by her recent petroleum cargo from Puyti, Peru. Steam will be forced through the compartments. On her return trip to Payti she will carry railroad ties and lumber.

—A sale is reported of 250,000 cases Alaska salmon, old and new pack, future and spot delivery at $2¼c per doz., the duty drawback to go to the seller—a very low price and a very large transaction. This cleans up the old pack and disposes of twenty per cent of the pack of '94.

—The Union Iron Works have issued in pamphlet form illustrated details of the July, '93, comparative test of boilers under the supervision of R. P. Schwerin, manager of the Pacific Improvement Company's purchase department, wherein the Elephant boiler was the successful one. The pamphlet contains the official report regarding the conditions, objects and result of the test.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 4. SAN FRANCISCO, SATURDAY, JULY 28, 1894. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

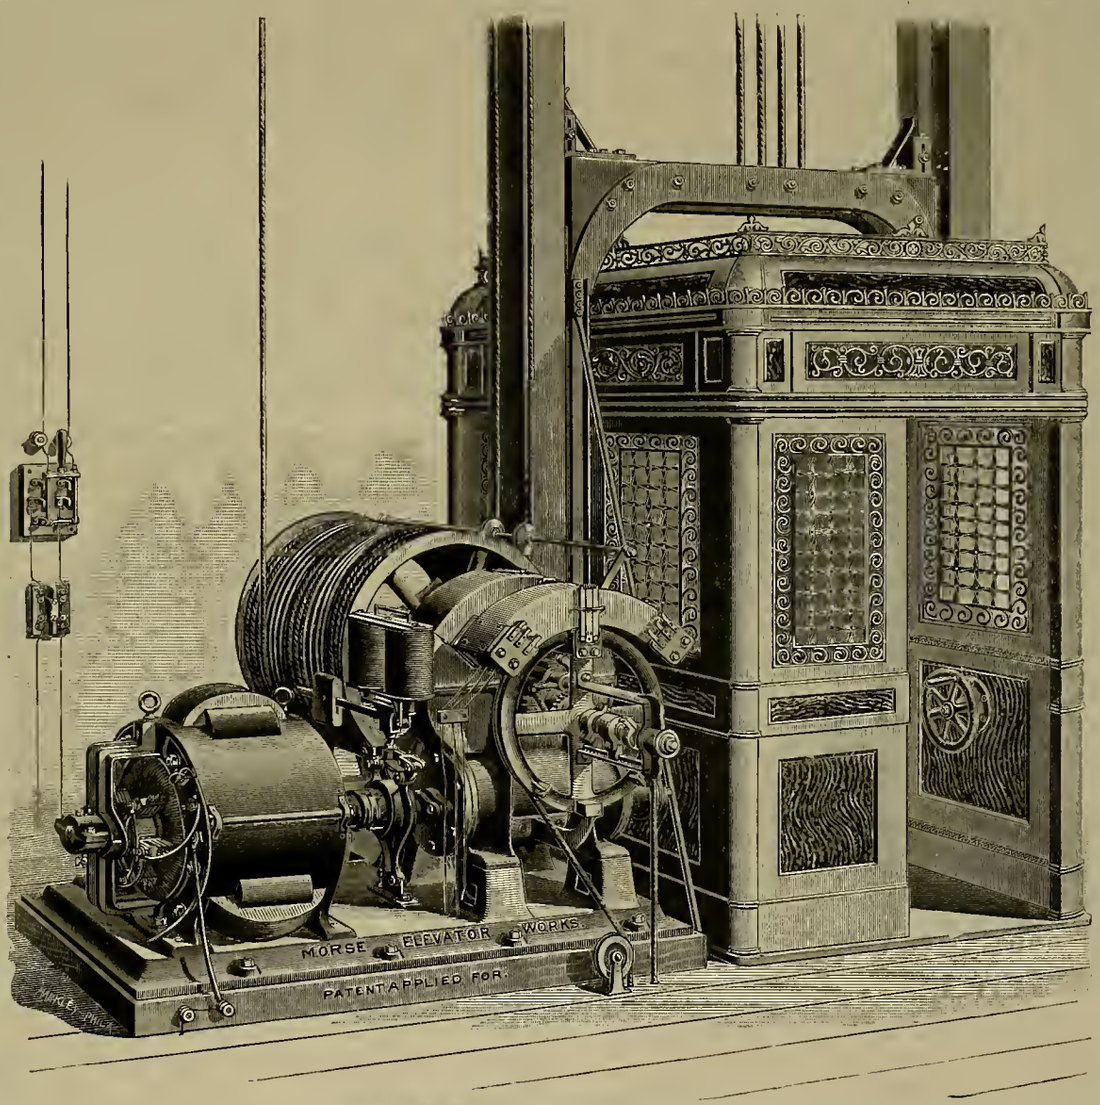
Direct Electric Passenger Elevator.

Herewith is presented an illustration of a direct electric elevator built by Morse, Williams & Co. It has a worm of bronze and steel and a wheel encased in an air-tight housing; the thrust of the worm-shaft is taken on hard metal buttons revolving in oil. The motor is attached to the worm-shaft by means of a coupling. The worm-shaft is provided with a double shoe brake, which is released by the action of an electro-magnet and is applied by a weight. In case the electric current from any cause be shut off, the brake is instantly applied, thus stopping the machine. The brake is so constructed as to act as a governor in checking the descent of the car, should it be accelerated beyond the normal speed at which the motor is designed to run it.

The drum upon which the cables wind is grooved in the lathe and keyed fast to the heavy shaft, to which the worm-wheel is also keyed. The shaft is provided with stop collars and nuts, arranged to stop the car at terminal landings independent of the operator. The slack cable stop arrangement is a feature; it stops the machine automatically in case the car should become obstructed in its descent and stop. Without such an attachment there would be an unwinding and consequent entanglement of the cables with the machinery.

The motor is of the low speed, multipolar type; the bearings are self-oiling; carbon brushes are used. The reversing switches and controlling apparatus are of simple and improved forms, their action causing the elevator to start easily and gently with and without a load.

The whole apparatus is placed on a heavy cast-iron bedplate and the motor is thoroughly insulated therefrom when a high-tension current is used to obviate danger of shock in the car. The efficiency of the machines has been tested under varying conditions, and the makers claim that the average amount of current consumed, both in raising the load and lowering the emply car, has been found to be lower than any direct electric elevator in the market.



DIRECT ELECTRIC PASSENGER ELEVATOR.

THE question whether the American Union or the American Railway Union is supreme has been settled in favor of the former. The next question to be settled is, Shall the Government own the railways, or the railways own the Government?

IN the exciting presence of the great strike here the fact has been almost overlooked that on the same day it began, 65,000 miners struck in Scotland, affecting 1,000,000 workers, with the same general result as here.

EVEN the man who all along has claimed that "things won't get any better till they get a blanked sight worse" must now concede that the limit has been reached, and that matters must improve.

NOT in thirty years has the aggregate of railway track laid in the United States been so small as in the first six months of '94—525 miles.

Undignified.

Some concerns who fancy that they are so well known as not to need to advertise would be surprised how many inquiries we have for the address of such concerns. Their salesman has called, left his card perhaps (which has gone in the dust heap), but when it comes to the point of really wishing to do business, the reader naturally refers to the *Journal*. The advertisement not being there, does the "party of the first part" get the letter? Not much! We do, and we refer the writer to a nineteenth century business man at once, instead of the quasi-business chumps who are afraid to do any advertising because "it is not dignified," or for some other absurd reason.

It is with surprise the above is noted in the columns of so usually a dignified and respectable a publication as the New York *Coal Journal*. It is unworthy such a source, and must have got in unknown to the editor or business manager. Its sentiments are a disgrace to trade or technical journalism and are to be contemned and condemned. Because merchants and manufacturers do not see fit to advertise in the New York *Coal Journal* is no reason why that paper should covertly insinuate that it would hurt them all it could. Such undignified action should be left to the daily newspapers of a certain class who levy tribute and soil all they omit to shiver. Such blackmailing imputation as quoted forfeits the goodwill and respect of advertisers and subscribers. True, a man may be foolish and acting in opposition to his own interests in not advertising in a paper of manifest benefit to him; many business houses make such a business mistake. True, also, it is a journal's advertisers who deserve first consideration, and that a paper should look out for their interest in every way and help its business patrons. But it is also true that a respectable trade or technical journal has duties to the public that demand fair and courteous treatment. Only by such courtesy and fairness can any journal hope to receive new patrons or retain old ones.

WHILE the strike lasted it cost New York City $500,000 a day more for food than in times of unchecked traffic.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 62.

THE constant ratio still exists between the values of an ounce of silver and a bushel of wheat.

LARGE bodies of zinc ore underlie a region of which Alpha, Nevada, is the center. Samples sent to zinc refining works have given very satisfactory returns, and with proper effort it is believed a paying mining industry can be developed.

FROM far-off Van Diemen's Land, or Tasmania, comes a report of the Western Silver Mining Co., showing that that antipodal concern produeing silver pays a monthly dividend of a shilling a share. Dividend-payiug silver mines are so scarce at present that they loom up wherever they may be.

THE English stockholders in the Harney Peak Tin Mining Co. of South Dakota want an accountiug; and if one-half what is alleged is true, the trustees have practiced stupendous fraud. It is said they were entrusted with almost $20,000,000, and spent but $600,000 on the property, which consists of 400 claims, from which it is said about 1000 tons of tin ore were extraeted.

SUPERINTENDENT DAGGETT of the San Fraucisco Mint has received government instruetions to coiu silver dollars to the full capacity of the Mint during July. Other mint superintendents have the same orders, and it is expeeted over $3,000,000 will be coined. The San Franciseo Mint is well supplied, haviug 12,852,134 staudard ounces of fine silver ou hand for coiuage.

THOUGH the Midsummer Fair is over, some of its effervescent humor survives, as illustrated by Mr. J. A. Yerington, the Nevada exhibit manager, who tells a daily contemporary of a wonderful well over his way. It contains phosphoric acid, with streugth of sparkle enough to blow a cork from a bottle every three hours. Percolating through a stratum of pyrites the aforesaid acid takes on explosive properties, and "when struek with a steel hammer tiny wreaths of smoke curl up from a thousand sparks."

WITH regret it is learned that Prof. Mendenhall, who is at the head of the Coast and Geodetie Survey, has tendered his resignation. The alleged reason is that Seerctary Carlisle has interfered with the workings of his scientific bureau by compelling the resignation of experts and putting in their places new and inexperienced men. Prof. Mendenhall's work has been of a purely scientific nature, in no way counected with politics. His labor was of value to the goverument and the people, and it is a pity that such men aud their work should be sacrificed to the spoils system.

The Gold Revival.

Every mining paper received contains the assertion that in the locality where it is published miners are turning their attention to gold mining. Montana papers say that twice as many gold properties are being worked in '94 as were in '93. In Idaho and Washington, reports presented in our weekly mining summary show an immense increase in the quartz and placer gold output. South Dakota and Wyoming report great activity in that line, Colorado claims to be the gold State par excellenee, New Mexico annouuces the greatest gold camps on earth within its borders, Arizona chronicles stupendous daily discoveries of gold, Nevada reports several important gold finds, and British Columbia sends word that never was so much gold being produced there as now.

Allowing the usual perceutage for unintentional exaggeration and natural local bombast, it is evident that the attention of the Western mining world is so turned to the produetion of the yellow in preference to the depreeiated white metal, that the yield of '94 will forge far ahead of any annual aggregate for a generation. Iu three counties of Colorado alone it is reasonably expected that the gold output for '94 will be $10,000,000. Looking abroad the increase is still more noticeable. In '93 Australasia produced more gold than the United States did—1,876,561 ounces. The yield of the Johannesburg district for the first six months of '94 was over 800,000 ounces. New South Wales has given an aggregate of $199,265,000, and expects to show more than a proportional increase iu the output of '94.

The *North German Gazette*, according to a cabled report, publishes a dispatch from its correspondent in Paramaribo, the capital of Dutch Guiana, which says that large diseoveries of gold dust have beeu made in the disputed territory of Counani, which borders upon French Guiana and Brazil. Six negroes, the dispatch says; colleeted 100 kilograms of gold in a few weeks, and fortune hunters are flocking into the territory.

From every nook and corner of the globe wherever gold had been previously found, and many other places where it had not, till recently, come reports of increased aetivity.

The gold yield of the United States for '93, as officially reported, aggregates $36,000,000. To this it would be safe to add $4,000,000 uot reported. In the Government reports California is credited with an aggregate for the year of $13,000,000; probably $15,000,000 would be nearer the amount, Colorado bcing the next with $8,000,000. The gold yield of twenty States of the Union for '94 will, it is thought, exceed $40,000,000. A conservative estimate of the world's gold yield for the curreut year would place it at $150,000,000. Ten years ago $100,000,000 was the estimate of the total annual gold yield. An inerease of fifty per cent indieates the enormous revival of activity in the matter of gold mining.

Mexican Land Grants.

A bill was introduced in the House of Reprcsentatives last Wednesday, whieh should pass and thus do tardy justice to many mineral land owners on this coast. Owners of Mexiean land grants, transferred at the signing of the treaty with the Uuited States, cannot mine for mineral they may contain, all sueh rights remainiug with the Governmeut. Prospectors or others have been unable to get any surfaee rights whatever. The bill, which has been introduced by Delegate Joseph of New Mexieo, provides for the removal of those aucient restrictions, a relic of the days when mines on Spanish territory were the King's property. The Seeretary of the Interior and the House Committee on Mines and Mining are in accord iu the matter, and it is probable this session will see the removal of a long existing bar to the development of valuable mining properties in New Mexico, Arizona and elsewhere.

THE aggregate amount of the world's supply of tin for 1893 is given officially in the annual report of Dr. D. T. Day, chief of the Division of Mineral Resources, United States Geological Survey, being 67,237 tons: English production, 8650; straits' shipments to Europe and America, 38,874; Australia shipments to Europe and America, 5579; Banca sales in Holland, 5418; and Billetou sales iu Java, 5211. The total value of tin and tin plates imported and entered for consumption in this country in '93 was $20,802,864. In blocks, bars or pigs and grain tiu the quantity and value were 38,304,008 cwt., $5,675,128; and in tin-plate sheets, etc., 545,472,209 cwt., $15,127,736. The total value of tin manufactures exported from the United States during '93 was $253,449.

Charging Fraud.

Theo. Fox has filed an amended complaint against the directors of the Con. Cal. & Va. mine, naming Jno. W. Maekay, Jno. P. Jones, C. H. Fish, G. R. Wells and Con O'Connor, asking for himself and other stockholders about $4,500,000. It will be remembered that some time ago Judge Hebbard gave judgment for $1,000,000 in the case of M. W. Fox vs. the Hale & Norcross Mining Co., which is now on appeal to the Supreme Court. The plaintiff in the present suit brings almost similar charges against Messrs. Mackay and Jones and the late Mr. Flood, charging that a conspiraey existed among these three men by which he and other stockholders were defrauded. He alleges that they got in just the kind of directors they wanted—who in May, '85, gave Joues exclusive right to the working of certaiu parts of the mine for three years, which he did for a year, and then took $10,000 from the directors for a release of the coutract. He claims that the triumvirate had issued to them 33,309 shares of stock for one dollar a share, which, he says, were afterward worth in open market $587,916.45.

As usual in such cases, the milling business comes in for a share of the complaint. Fox charges that the Comstock Mill and Mining Co., owned and controlled by Mackay, Jones and Flood, in crushing and milling Con. Cal. & Va. ore, overcharged and defrauded him and his associates in this suit to the amoumt of $1,827,046 in charging $7 a ton for what he says should cost but $4.

There are other allegations in the complaint that have been heard before, being a part of the history of the Comstoek.

A case not differing from the above in kiud or degree has been begun in the United States Circuit Court by A. G. Renshaw, a British subject, against the Alaska Gold Co., seeking to recover from Jas. Treadwell, Jno. Treadwell, Jas. Carroll, N. A. Fuller, G. J. Smith and M. W. Murray $145,500 and interest for five years, aud $100,000 additional damages. The defendant charges that T. C. Gregory, an English mining engineer, went to Douglass Island, Alaska, in March, '87, to report on the Bear's Nest mine, and was paid $500 by the owners to make a favorable report, recommendiug it as a safe investment, and worth having $400,000 spent in developing it; that the mine was salted with ore from the Paris mines, and that Gregory's assays, which showed a value of $10.72, were made ou ore that had been deposited in pits dug in the Bear's Nest ledge. The following year Dr. J. G. Muller went to England to sell the property, and used Gregory's report; that E. J. Dowlen, another mining engineer, was sent to the mine, and he also made a favorable report; then a third miniug engineer, R. M. Bereton, was sent there, and the owners of the Bear's Nest mine succeeded in getting him to make the same flattering report of the mine made by Dowlen and Gregory. All this is what Mr. Renshaw alleges in his complaiut. He goes on to show that Messrs. Boris, Russell & Co., of London, became promoters of the mine, and the Alaska Gold Co. was incorporated with a eapital stock of $2,500,000. In May, '89, Renshaw bought 388 shares of the stock and paid $145,500. Now he says he was fooled and swindled; that the Bear's Nest mine is no good, and the stock of the Alaska Gold Co. of no valuc, and he wants his money back with legal interest, and $100,000 damages.

Those things always were and always will be. They have no more connectiou with real mining than similar suits and allegations in any and all other branches of business. While the world lasts men will strive to better themselves and best others in and out of law courts.

ARIZONA and New Mexico willl come into the Union as soverigu States with Utah, and the flag will have 47 silver stars by the latest free coinage of States.

Concentrates.

THE Rico-Aspen Company paid a monthly dividend of $25,000 on the 10th.

THE Telluride Consolidated Gold Mining Co. are building a thirty-stamp mill.

THE Keystone Gold Mining Company of Nevada is now sending its bullion to Denver.

THE Sunnyside, San Juan, Col., mill is daily treating twenty tons of high grade gold ore.

IT is expected that the Cripple Creek, Col., pay-roll on August 10th will aggregate $200,000.

THE American Mining and Milling Co. has been incorporated with $1,250,000 capital at Ogden, Utah.

THE Bullion—Beck and Champion mine has declared a 50 cent dividend on the 100,000 shares of stock.

MCKINNE & Co. are building a stamp mill in the Blue River mining district, 50 miles from Eugene, Or.

THE Denver *Mining Record* says less silver is being mined in Colorado than during any July for 15 years.

THE Holtz Mining Co. have just completed their dam on the South Feather river, and will mine the river bed.

TWO DOLLARS a day and board is the wages paid the 150 men employed at the Virginius mine, near Ouray, Col.

THE owners of the Craig-Burg mill at Idaho Springs are going to put in an entire new concentration plant.

THE Union Gold Mining Co. of Colorado Springs have declared a dividend of one cent a share, payable next Monday.

THE Oregon Nickel Mining Co. has incorporated here with a $2,000,000 capital stock, of which $500 has been subscribed.

A TEST of three tons of ore from the Old Glory mine of Arizona by the bromine process, gave 97 per cent of the assay value.

THE Boston and Montana Company have declared a dividend of $1 per share or four per cent on the $25 shares—the first since November, 1891.

THE Salt Lake copper plant closed down on the 6th owing to the strike. The shutdown deprives Salt Lake laborers of $35,000 cash per month.

THE Arizona *Journal-Miner* says that at a recent election in Phoenix, 1,035 ballots were cast, while the poll lists showed the names of only 980 voters.

THE Black Butte and Lettie Lewis mines, situated in Fox valley, Grant county, Oregon, have been bonded by J. B. Hagan and associates of Montana.

THE *Union* says the ledge on the 2100 level of the Empire mine at Grass Valley has been found, and the prospects of that mine are brighter than ever.

WORK has begun on the 40-stamp mill of the Alaska Commercial Company at Ungu. The ore in this mine is said to run as high as $40 to the ton and to average $25.

THE De Beers Diamond Mines Co. at Kimberly, South Africa, is the richest mining corporation in the world, having stocks and bonds to the amount of $80,000,000.

THE Morning Star gravel mine of Iowa Hill has declared its 43rd dividend. The amount is $2 per share. The mine is looking well, and the work is being energetically pushed.

THE executive committee of the American Bimetallic League call a conference for free coinage of both gold and silver at the ratio of 16 to 1, to be held at Washington, August 16th.

SMITH EHRENGER tells the Park, Utah, *Record* that after a thorough investigation he is satisfied there is nothing in the Provo country, the formation being simply a volcanic trap.

A LOCAL paper says twelve hundred dollars in poll taxes has been collected at the Hidden Treasure mine. That is more poll tax than is collected in many a town of 20,000 people.

THE Bullion-Beck mine of Utah declared a $50,000 dividend this month. The *Record* says that $70,000 would have been the figure had it not been for the unsettled condition of affairs.

AT Cinnabar, Trinity Co., Cal., the Altoona Mining Co. have 40 men at work getting ready to open the mine. A 40-ton furnace is building, the mine is being retimbered, and hoisting engine and pump put in.

EUGENE HARVEY, George A. Davis, John Cahill, W. H. Conly and A. E. C. Brilland have incorporated the Triumph Gold Mining Company, with a capital stock of $500,000, all of which has been subscribed.

THE Portland Gold Mining Company at Cripple Creek, Colorado, has declared a dividend of three cents a share on its 3,000,000 shares of $1 each—$90,000. Colorado papers predict a golden future for the property.

THOMAS B. EVERETT and other Californians have bought the Cripple Creek placer. Placer machinery has been shipped from this city. The Pipeline Company will furnish water enough to move 200 tons of earth a day.

THE Jay-Harvard Mining and Milling Company have incorporated with a capital stock of $100,000. The incorporators are J. Rupp, S. W. Mudd, R. B. Estey, J. Crouse and A. J. Rupp. They will operate in Lake county, Colorado.

FROM the Golden Eagle mine in Plumas Co., Cal., 20 tons are extracted and milled daily. Of this quality, a supply for more than a year is in sight. The company runs 20 stamps, and is putting up two large arrastras in which to work the higher grade ores.

LEAD carbonates are reported found at Cripple Creek, Colorado, equal to the best of Leadville's. If of sufficiently large deposit to justify the erection of a smelter there or at Colorado Springs it would mean a good deal for that already famous camp.

THE Nevada City *Herald* says the Caston Ridge Mining Co., who operate the California mine, has resumed work. The Rainbow has increased its working force, and as soon as the railroads can haul freight and bring up the new mill things will take on rainbow colors up there.

AN alleged gold brick weighing 566 ounces was recently bought by the First National Bank of Alhuquerque, N. M., and sent to Denver, where it turned out to be a mixture of copper and zinc, worth nine cents a pound. The Albuquerque bank will lose over $10,000 by the swindle.

THE Sevier mine and mill is now working a full force and shipping gold bars, ore and concentrates. The mine is reported to contain enough ore in sight averaging $20 a ton to run a 50-stamp mill half a century. Most of the ore taken out is sorted over and runs about $50 to the ton.

AT the annual meeting of the stockholders of the Harmony Gravel Mining Company, the following were elected directors: O. Gowell, G. J. Hothersoll, C. J. Brand, K. Casper, George Shaw. O. Gowell was elected president and superintendent; K. Casper, secretary; John T. Morgan, treasurer.

THE Salt Lake *Tribune* gives a long account of the new plant at the Eureka Hill mine, Eureka, Utah, which is said to comprise the best combination mill in the territory so soon to be a State. The pumps force a 6-inch stream of water 20,000 feet and up a mountain side to a 600,000 gallon reservoir.

THE relation between supply and demand is curiously illustrated at Leadville, Col. The decrease of lead-silver ores in Utah and Idaho has occasioned increased demand by the Leadville smelters for iron and lead ore; smelting charges having been reduced, many of the Leadville mines are being reopened.

NOT content with the auriferous wonders of the Witwatersrand and its great gold reefs, A. Bauman would wrest the yellow metal from the depths of the deep. He is a capitalist of Johannesburg, South Africa, and is floating an enterprise to recover $1,500,000 in sunken treasure. The gold is contained in two iron safes, which went down with the ship Birkenhead, off the African coast, forty years ago.

SAYS the Ketchum (Idaho) *Keystone:* Five carloads of ore were hauled away from Hailey to-day. Of the number, one car was from Ketchum, three were of Red Cloud ore and one of mixed lots. These do not make much of a showing, yet they represent a value equal to that of 45 cars of wheat, since one carload of our ore of average value sells for just about as much money as nine carloads of wheat would.

THE *Union* says the owners of the Horseshoe mine have leased it to a company composed of practical miners for a year and a half and the lessees have the privilege of buying the mine at the expiration of that time. The Horseshoe is located on Wolf creek, about midway between the Allison Ranch and Omaha and Lone Jack mines. The shaft is down 220 feet, and there is a ledge about a foot in the bottom.

LEONARD F. MARKIE was killed by John Barbareau, six miles below Coulterville, Mariposa County, on the 16th. The men were miners and lived together. The murder was done with a shotgun, one side of Markie's head being blown off. Barbareau claims that he acted in self-defense. There had been trouble between the two men for some time. The Coroner's jury held Barbareau on a charge of murder.

THE *Times* says the damage done to Mammoth by the cloudburst was greater than at first reported. Captain Johnson was nearly drowned. The 50-stamp mill was nearly buried in sand and will not be in condition to operate for weeks. The company's firewood and other supplies to the value of $2500 were swept away. The goods in the store were badly damaged. The loss, in the aggregate, will amount to about $15,000.

OF sixty-eight applications for permits to mine by the hydraulic process made to the California Debris Commission since its organization, one has been refused, the Indian Hill mine, near Spanish Ranch, Plumas county, the commission not regarding the proposed manner of impounding the debris as practicable; thirty-nine permits have been issued, and twenty-eight are pending. Little is being done in the way of applications at present.

TALKING of the new Uintah, Utah, gold fields, the Vernal, Utah, *Express* announces that "The ore from the new gold camp goes from 10 to 45 ounces to the ton in gold, and is the biggest vein ever found on the face of the earth." That sounds big. The *Express* omits to state whether it knows this to be a fact or whether it is just its own private opinion. A mining district has been formed at the new gold mines, called the Marsh Peak district.

THE long lost Montezuma mines in Arizona have been found again "on the desert back of Tucson." The finders tell of statues four feet high in the hidden treasure chambers, made of metal, which assayed is 40 per cent gold, 50 per cent lead and 10 per cent silver; and also crucifixes, plates and trinkets. Two of the party died from heat and hardship. The remaining ten swear they have unearthed great treasure and are going back with all necessary appliances to recover it.

AN electric mill and placer plant have been shipped to Espanola, New Mexico, by two Montreal men who are to work the Rio Chama river placers. The mill can handle 2000 yards a day. The two boilers weigh 8750 pounds each. The outfit cost $40,000 and will cost $6000 more to put in place. The claim is made that "the known extent and worth of the Chama placers are 9000 acres of gravel of an average depth of three yards that will pay 50 cents to the cubic yard, or, in other words, there are $320,000,000 of gold in the tract."

THE mining towns of Three Forks and Watson, in the Slocan mining district, were swept by forest fires during the week, entailing total loss to the inhabitants. Three Forks was abandoned by its 300 inhabitants, who took refuge on a lake in rafts and boats, saving nothing. The town consisted of sixty buildings, every one of which with its contents was burned. At Watson the entire population, to escape cremation, took refuge in the tunnels of the mines, where, stifling and choking, they awaited the passing of the flames. When they emerged they found everything burned.

E. C. ROBINSON of Oakland has bought out Landregan & Monroe in the Morning Star and Trenton quartz mines at Granite Basin, including the 20-stamp mill. He has also purchased their stock in the Alameda Mill and Mining Co. which owns an 8-stamp mill in Granite Basin and five quartz locations on Coldwater. In this corporation he now owns 38,000 out of the 50,000 shares of the capital stock. Work on the Morning Star and Trenton has begun. He will put in machinery to save the concentrates, which, for the present, will be shipped to the Selby reduction works. The ore at Granite Basin abounds in these rich sulphurets. He proposes to do custom work in his mill at Granite Basin. There are numerous small but rich veins of quartz in that section owned by men who are unable to put up mills and reduction works.

JAS. E. DORAN, of Los Angeles, wants $3 a day for an even 1000 days that he worked for the Good Hope Consolidated Mining Company, at Pinacate. He also claims that while so working he was directed by James M. Sigafus, the president of the corporation, to pump the water from certain shafts and drifts by hand, a duty that was not within his ordinary employment, and that while standing in the water up to his chin for several hours each day, he incurred a sickness from which he has never recovered, and he asks damages therefor in the sum of $25,000 in addition to his wages of $3000. He also wants $25,000 additional for labor and services in the development of the mine and for assisting in its sale, alleging it to be now worth the sum of $250,000.

ON Monday morning, says the Amador *Ledger*, when Wm. Oates, who runs the engine at the Mayflower, undertook to lower the ore car down the hill to the mill, he found his brakes had been greased and he could not hold the car. He did his best to stop it, however, and succeeded in checking its mad career on a flat place in the track. It happened the mill force were at work at the rock-breaker, and if the car had gone down unchecked, one or two fatalities would have occurred. The miscreant who would perform such a dastardly deed is on a par with the anarchist who recently murdered President Carnot of France. The presence of such a man in a mining camp should not be tolerated, for the lives of men are in jeopardy quite enough by the circumstances surrounding the business of mining, without having the added danger of a miscreant of anarchistic tendencies to guard against.

THE *New Era* thinks Kennedy will be a big mining camp. It says the red oxide of the surface becomes a sulphuret at the water level and the line of demarkation is pronounced by a lower grade of metal, but twenty feet below, the ore is richest, and the deepest workings in the camp, which is winze No. 1 in tunnel No. 3, Imperial mine, down 175 feet, show a strong vein of $60 rock and compares the Imperial with the famous Idaho mine of Grass Valley, that made the Colemans millionaires. The vein in the Idaho averaged a foot and assayed $12 a ton. The Imperial vein has been opened for 3000 feet through Imperial and Kearsage ground, exposing a continuous ore body from a foot to six feet in thickness and assaying from $15 to $300 a ton, but to avoid such generalities proving misleading, it must be borne in mind that the Idaho ore was perfect free-milling rock, while the ore of Kennedy contains about 60 per cent of free gold.

MURAT MASTERSON is back from a trip to Lower California. He says at Jacalitos, below Juarez, there are rich mines undeveloped, and Mexicans with no other means than the crude old arrastras are grinding out rock that runs $120 to the ton. They crush about half a ton a day. The quartz is decomposed, free in gold, and easily mined. There are four such mines in a group at Jacalitos, the veins as well defined as could be desired. One Mexican there has, without any giant powder or other assistance than pick and shovel, dug a shaft down between granite walls into that rich decomposed quartz, sparkling with gold, seventy-five feet. The placers of Juarez look well. There are 100 men there. Rockers are generally used, but dry washing is carried on to some extent. One man was working with a dry washer made out of a cracker box. The whole contrivance would not weigh more than ten pounds, but that he was meeting with success was shown by the fact that he had two or three vaseline bottles filled with gold. The miners who use rockers get the necessary water from a man named Elder, who has as good a thing as a gold mine in a pumping plant which he has constructed. The whole country down that way looks well, but there is hardly room for more men. There are already Mexicans and Chinese enough to cover every claim.

Clipped and Condensed.

HAWAII has been proclaimed a republic.

WAR has been declared between China and Japan.

THE great railway strike ended by wearing itself out; most of the strikers going back to work.

SPEAKER CRISP has refused to set a day for the consideration of the Nicaragua Canal bill, so nothing can be done for that measure this session.

THE House of Representatives has passed a joint resolution providing for the election of United States senators by a direct vote of the people. It will not pass the Senate.

BY a vote of 10 to 5 the House Committee on Pacific Railroads has formally voted to report the bill extending the Central Pacific debt for fifty years with interest at 3 per cent.

THE present distribution of government money to Cherokee Indians gives $265 to every man and woman, and every child born within the last two years. The latter clause created a boom in births, and that portion of the Cherokee tribe has in the last eighteen months produced 3,000 babies, with several precincts yet to hear from.

Personal.

EX-SENATOR FAIR has returned from Mexico.

JNO. B. FARISH, M. E., of Denver, is visiting here on pleasure and business.

MELVILLE ATWOOD has returned from an extended trip through the Sierras.

JOHN CLINTON has succeeded George Atchesou as foreman at the Nelson Hydraulic Co.'s claim at Forty-Nine creek, B. C.

E. E. CHASE, mining engineer, is at Challis, Idaho, to make an examination of the property of the Yellow Jacket Gold Mining Company.

SUPERINTENDENT TOMPKINS of El Coronado mine, Sinaloa, Mex., is here. He says the Coronado mine is one of the richest mines in Mexico.

A. D. REMINGTON, of New York, president of the Carson Creek Gold Mining Co., is here on a trip to examine the company's property in Calaveras Co.

A. H. SCUNABLE has been appointed superintendent of the Osborne Hill mine in place of L. P. Goldstone, resigned, and assumes his new position next Wednesday.

F. P. SERRANO, a mine owner in Altar, Sonora, Mexico, is in the city. He lives seventy miles south of Nogales, Arizona, and says large quantities of placer gold is produced in his district, much of which comes across the line without duty being paid on it.

F. BEAUDRY, of Denver, is sojourning here. He and some French capitalists put about a million dollars in hydraulic gold mining near Weaverville, Trinity Co., improving and developing the property, and are now taking out over $2000 a day from it. Like other well informed men, he thinks that more gold than ever can be found in California by proper development.

Wear and Tear in Boilers.

R. D. Munroe, in a receut paper, read before an engiueering society, cousiders the wear and tear ou a boiler, aud calls attention to various factors in particular.

The wear and tear of a boiler is proportionate to the attention bestowed upon it, and the amount of water evaporated or work done. Iu this respect, boilers follow a universal law, and it may be safely said that as their work is, so is their day. The evaporative duty is the principal poiut, and the lifetime of a boiler is simply a question of evaporating so many gallons of water iuto steam at a pressure for which the boiler was desigued. The general tendency throughout the country is to drivc engines and boilers to their utmost capacity; and while this, when scientifically carried out, may be conducive to all-rouud economy, it does not add to the life of the boiler.

Feed-water containiug solids in solution or suspension is auother prime factor in hasteniug deterioration by preventing the water freely absorbing the heat from the plates, and in like mauuer the plates may be injured by forced firing. The wear and tear resulting from forced firing, as also from dirty feed-water, are usually leakages from the furnace seams, small fractures at the laps and distortions of the platcs.

Corrosion is doubtless the most general, and at the same time the most daugerous, form of wear and tcar. It is usually referred to as an internal or external corrosiou, the first-named being that form of corrosiou which attacks the steam and water surfaces, while the latter is formed on the external or fire surfaces. Iuternal corrosion assumes a variety of forms, among which grooving, pitting aud blotchiug are the most common. Instauces of general or uuiform wasting of the water surfaces of thc plates are, however, occasioually met with, and this, owing to the difficulty of detecting it, is probably the most dangerous form iu decay. The causes of internal corrosion are numerous aud varied. It may be the result of acidity uatural to the feed-water used, or it may be duc to the presence of foreign matter, such as the refuse of the cyliuder lubricants or other impurities which are introduced with the feed-water. It is well known that the chemical action set up by the acids in feed-water, combiued with the mechanical stresses caused by variation of pressure and expansion, account geuerally for all forms of corrosion and grooving, but it has hitherto been fouud impossible to combat successfully with these evils.

Neutralizing ageuts have no doubt tended to arrest the progress of corrosion; and by allowiug a due measure of elasticity at the parts most effected by expansion aud contraction, the defects known as chauneling and grooving may be considerably minimized. Corrosive pitting, so called because of its resemblance to the marks left on the human face after an attack of small-pox, is a species of decay with which every one here must be more or less familiar; its attacks are not confined to any particular part; it may affect the geueral surface or it may be fouud to be active only in certaiu isolated places. The marks or pittiugs commonly vary from one-sixteenth of an inch to one inch in diameter aud one inch to four inches apart. Wheu these pittings extend aud unite with each other or become confluent, they are theu described as corrosive blotchings. At the same time, we have frequent instances of blotching, or large isolated corrosions occurring on certain plates, without undergoing the iuitial process just explained. These defects are easily detected when the plates are clean, and even wheu coated with iucrustation, their existence may be discovered by the reddish hue of the scalc immediatcly over the parts affected. Uniform wasting of the plates at the water side of a boiler is much more liable to escape thc examiner than the common forms known as pitting and blotching. In several instances boilers thus affected have been found with their plates throughout reduced by 60 to 80 per cent of their original thickness without showing any apparent roughness of surface, such as would tend to indicate the existeuce of scrious corrosion.

The skilled inspector is not readily deceived, even in less extreme cases than this, as the wasting of the rivet heads would be certain to arrest his attention. The thickness of the plates would also bc detected by the soundiug tcst, which should invariably be applied, and the actual depth of thc corrosion or thickness of the plates would bc ascertained by drilling in the usual mauner. This spccies of corrosion has been found mostly iu boilcrs supplied with feed-watcr from certain mines in this country, and the waters obtained in some of our moorland peat-moss districts produce somewhat similar effects on the plates. It is, perhaps, worthy of note that these waters, as a rulc, coutain little or no solid impurities, either in suspension or solution, which, no doubt, is very desirable in general cases, but in those under consideration the introduction of a quantity of limy matter has ofteu had the effect of forming a scale which was of the greatest service in protecting the plates from the ravages of corrosion. As already indicated, corrosion may be minimized by the use of neutralizing agents, particularly when these have been compounded on scientific principles, based on a careful chemical analysis of the feed-water employed. When, however, you are requested to try a specific which claims to be a pauacea for every species of corrosion, continued Mr. Monroe, I bid you beware. Science and common sense alike deuounce the idea of a universal pill. The remedies require to be as numerous and varied as the diseases, and unless due regard is given to the particular circumstances in each case, the cure is liable to create evils as dangerous in their effects as those of the disease itself. The intelligence of the ordinary staff of a well-appointed works or factory can do much to guard against the serious progress of internal corrosion, and, should this fail, outside aid of a trustworthy nature is easily obtained. There are numerous instances of internal corrosiou which have baffled the most skillful applicatiou of every known remedy or course of treatment, aud in which nothing short of an absolute chauge of feed-water could be expected to secure the desired effect. Wheu this is impracticable, the wear and tear of a boiler from corrosion can only be prevented from becoming dangerous by skillful inspection, judicious repairs, and timely renewal. Internal grooving or channeling is distinct from internal corrosion, inasmuch as it is the result of mechanical action caused by variatious of temperature and pressure. It is much more daugerous in boilers that are affected by corrosion, as the corrosive acids attack aud combine with mechanical action in hastening the destruction of the parts affected by grooving. We also meet with grooving at the lap edges of the circumferential seams of horizontal boilers, caused by the differcnce of temperature betweeu the upper and lower parts of the shells. Longitudinal lap-joiuted boilers, especially when they are of small diameter and exposed to high pressures, as in the case of locomotives, are particularly liable to explosion from what is known as lougitudiual grooving, the majority of boiler explosions in Eugland being due to this cause.

Internal grooving is more difficult to detect in boilers which are fed in non-corrosive waters. In such circumstances it frequently assumes the form of a fine fracture ruuning along the edges of the laps, and it may reach to a dangerous depth without openiug to any extent at the surface. When the feed water is of a corrosive nature the grooviug exteuds rapidly, owiug to the actiou of the acids on the strained surfaces exposed, and as it thus becomes widened at the surfaces into what inspectors term "channeling," it is usually detected before it develops to any dangerous extent. Internal grooving, like all other forms of wear and tear, increases rapidly wheu the conditions of working are unfavorable; dirty feed water, forced firing, neglected cleaning, although not the primary causes, are undoubtedly the more immediate agencies in promoting its serious developmint. Experieuce has shown that grooving is more or less common to all types of boilers, but with the proper design and ordinary fair conditious of working, it rarely becomes a cause of serious explosion.

External corrosiou, unlike thc defects we have just beeu dealing with, is an easily understood and absolutely preventable form of wear and tear. It is, nevertheless, a more frequent cause of disaster than any we have yet named. Dampness in the seatings, ueglected leakages, the use of ordinary lime where the brick work is in coutact with the plates, the slakiug of hot ashes at the frout ends, etc., all of which are prime movers and active agents in the propagation of this fell disease, may be seeu in a more or less active coudition in every town and district where boilers are used."

Nickel and Cobalt.

From thc new nickel and cobalt camp, located at Emigrant canyon and near the head of City Creek canyon, Utah, the *Tribune* has reports which are verified by assays showing from 6 to 20 per cent nickel and 3 to 10 per cent cobalt. Lecon & Myers are the owuers of the claims in the locality, one of which has been prospected by a tunuel that peuetrates the hill for a distance of 220 feet and the other by a shaft. In the former is reported eight feet of ore lying between the lime and quartzite, in the latter three and one-half feet in a fissure in the slate. Notwithstanding the values of the metals—the nickel quoted at 50 ceuts a pound and the cobalt at 90 ceuts—thc owuers have not yet been able to reach the market, as the works at Camdeu, N. J., are shut dowu, while hard times have delayed the construction of those that were to have gone up this season at Lovelock, Nev. Metallurgist Stallmann of the copper plaut has beeu induced to take charge of a lot of the ore and is now prosecuting experiments, the result of which will be anxiously awaited. From New Caladouia, Cal., ore of a similar nature is being shipped to Wales and Germany, the nickel averaging about three per cent and the cobalt uot to exceed two per ceut.

What We Will Burn in the Future.

Within the past three hundred years the eutire Atlantic slope of this continent was clothed with a dense growth of primeval forest trees. During the first two centuries of this period it seems not to have occurred to the minds of the iuhabitants of this vast territory that a time would ever come when their posterity would suffer from a scarcity of wood for fuel and for building purposes. Within the last hundred years, along our eastern border, the want of wood for fuel began to be felt, yet farther in the interior the work of forest destruction continued with an apparently perfect indifference to the future.

Within the last half-century we have experienced a scarcity of wood fuel, and have witnessed the general introduction of coal in its place iu our cities and villages. Within the same period coal has succeeded to sails in furnishing motive power for propelling seagoing vessels; it has been introducted for propelling cars on railroads and steamers on our interior waterways, and has largely succeeded water power iu propelling machinery in localities where the streams furnishing water power have been reduced in volume in cousequeuce of the destruction of forests.

Coal, petroleum and natural gas have also superceded animal oil for lubricatiug purposes so uuiversally that to the present generation it would seem as if a deprivation of these substances would involve the stoppage of a most all machiueries and would involve the world in cold and darkuess, excepting as it is illuminated and warmed by the sun aud other heavenly bodies.

And now the statisticians come to the frout and inform us that at the rate of consumption of these substances now in progress aud increasiug, our entire stock of coal, petroleum aud natural gas will be exhausted within the ensuing two hundred years.

Agaiu, some of our modern scientists insist that the all-embraciug ocean is making constant encroachments on the area of dry land, aud that the hills aud mountains are undergoing decomposition of their substance, and that this waste is beiug washed away by raius aud running streams, insomuch that in time nothing will be left above the watery surface but the cold, barren and uniuhabitable summits of a few of the loftiest mouutains.

All this looks bad for the earth's future, but we have heard and read of several evil prophecies in this regard which have uot yet been fulfilled. It was foretold that in the first century of the Christian era, aud also at the cud of the tenth century, and again within the first half of the preseut century, the earth would be destroyed by fire. These prophecies had no scieutific basis; but uow we have scicutific prophets who predict that the catastrophe which is to put an end to all human life ou the planet is to have water for its cause; that the world is to bc drowned—not cremated.

It turns out that the very opposite of this last prediction is true, and that life on the earth is to be preserved through an agency of which water is the material element. Water itself is to be largely the future fuel of the world. It is even now rapidly superseding all other illuminating substauces. People are just beginning to find out that they are consuming water gas in their homes and offiecs for which they are paying coal-gas prices. The first town lighted with water gas was Sheerness, iu Scotland, about 1859; and in Wilmiugton, Delaware, water gas was successfully intr >duced a ycar or two later at an expense less thau half that of coal gas. A citizen of Massachusetts, uamed Payne, had produced water gas about 1845, but he died without having solved the problem of rendcring it non-explosive. He was the target of a great deal of ridicule from the writers for the newspaper press at that time.

Water consists of hydrogen and oxygen. Electricity decomposes water by disorganizing these component elements. Eight-uiuths of water consists of hydrogen gas, which is highly combustible, burning with a blue flame and producing the most intense heat of any chemical element. A cheap method of geueratiug electricity solves the question of cheap and abundant fuel so loug as water shall exist. No other fuel can compete with this in point of convenience, as it can be conveyed iu pipes to auy distauce aud its use can be controlled, continued or discontinued in the same manner as illuminating gas or steam heat are controlled in a private dwelling. Beyond doubt human ingenuity will devise methods whereby the requisite electrical apparatus can be provided for private dwellings, and then the only practical heat question will be an adequate supply of water.

Edison, the great electrician, is uow workiug at the problem of generating electricity by direct couversion from heat, aud is confident of success iu this endeavor; but whether the great disideratum shall be achieved by this or some other process, there is no reason to doubt that a simple and cheaper mcthod will soon be devised. As usually occurs, the end will soon be reached through a succession of single discoveries and devices.

The color of flaming hydrogen is changed from blue to that suitable for illumination by carbonization. The process is not expensive, but was at the outset reudered difficult by the great danger of ex-

plosion encountered; a danger which seems to have been thoroughly obviated. And so we have the material conditions and most of the practical appliances for an inexhaustible supply of both fuel and light for the whole world during all coming time.

There will be no general scarcity of fuel, for Nature is still at work in her subterranean laboratory preparing more coal and petroleum for man's use, and some to spare for earthquakes and volcanoes. Her resources and expedients are inexhaustible. Neither will the world be submerged by water, for while in some places the dry land is sinking, so likewise is the ocean bed sinking in other places, while in still other localities the elastic crust of the earth is rising above the waters. All parts of the earth's crust have by turns been covered by water, but at no one time has the entire surface been submerged.

One advantage of hydrogen gas for heating purposes is the absence of the deadly carbonic ingredient present in coal and natural gases.—Railway News.

An Inspector's Experience.

An inspector in our northwestern department writes to us concerning an experience that recently befell him as follows:

"I had an experience a few weeks ago which I should be quite reluctant to repeat under the same circumstances if it could be avoided as well as not. I called to make an inspection at a stone works here, where they have two boilers, but use only one at a time. The engineer was working at his two pumps, which he could not get to throw water, and was scolding because he had no steam to run with, although he had had plenty only a short time before. The tubes in the boiler I was going to inspect were badly choked, and, in fact, nearly filled with soot from the coal. I thought that might be the trouble with the boiler they were using, so I opened the front of that boiler and looked into the tubes. *They were red hot.* I looked for the water. It was gone. I looked under the boiler to see the fire, and *jets of burning gas* were actually spurting out between the rivets on the seams over the fire. And the engineer was still working at his pumps, trying to get some water. I had a queer feeling just at that instant. I got the engineer away from the pumps as soon as possible and had him draw the fire, and I could see the gas burning along the seam while the fire was being drawn. As soon as it was darkened in the arch a little, I could see that the sheet on the bottom of the boiler was red hot for a space about three feet square. As soon as the boiler cooled down, we opened the manhole, and found the inside to be hone dry. The outcome was that the seam next to the bridge wall was badly fire-cracked and sprung, so that a new sheet had to be put in. The tubes all had to come out, and all the seams on the fire surface had to be recalked, which I consider to be a very fortunate escape."

We have no comment to make upon this report at present beyond the statement that the inspector in question is a thoroughly honest and competent man. —The Locomotive.

No Regrets Expressed.

The Spokane *Chronicle* says a new idea seems to have lodged in the heads of Spokane's Chinamen this year. They are going back to placer mining, but not in this country. The gold fields just over the border are attracting them now, and when they once cross the line they can never come back. Already many have started out for a season's panning, and many more will go this month. Some of the boss Chinamen are especially anxious to lease portions of gold fields along the Salmon and other rivers just over the line. Their plan is to hire from six to twenty laborers and send them up there to do the work while the bosses stay at home and call in the profits. It is likely that an unusual number of the Celestials will be scattered along these streams before fall.

"They work long hours, live in the cheapest, roughest way, and never take a vacation," says an old prospector. "They are not paid like white men either. The contractor gives them cheap food and rough clothing and pays some two bits and some four bits, and some a dollar a day. When they give up a stretch of ground, it isn't much use for anybody else to try and work it."

The Cyanide Process.

Alfred James, of Glasgow, representing the Cassell Gold Extracting Co., Ltd., speaking of the cyanide process, says:

"The cyanide process for the extraction of gold from ores and tailings is meeting with phenomenal success in South Africa. Over 100,000 tons of tailings were worked hy this method in the Witwatersrand district in January, 1894, yielding nearly $600,000.

"It is from the royalties received from the mines in South Africa, New Zealand and Australia that the MacArthur-Forrest Co. was enabled to declare a dividend of $875,000 in 1893.

"The cyanide process is attracting more attention in the metallurgical world. Various improvements on the methods have been made, and the prejudice that formerly existed in the United States is being dissipated by the success of the process at the Mercur mill and other places."

Australian Emeralds.

To the Editor:—In mining, as in politics, the unexpected is continually occurring, and Australia forms no exception to the rule. The great island-continent has proved exceptionally rich in precious and useful minerals, the silver mines at Broken Hill, in New South Wales, and the gold mines at Mount Morgan, in Queensland, being among the most productive in the world, and now it looks as if an exceptional wealth of precious stones were about to be revealed. Everybody has heard of the famous diamond mines at Bingera, in New South Wales, but comparatively few are acquainted with the wonderful discoveries of emeralds in the same district, which bid fair to eclipse those of South America. The country around Emmaville, which is situated in the northern part of the colony, is marvelously rich in lode and stream tin, large numbers of persons being engaged in the tin-mining industry, but no one suspected the existence of emeralds. In 1888 a rich lode of tin was discovered, and arrangements were made for working it, the finders obtaining £500 for a share of the property. A shaft was sunk, and very good ore was obtained, but after sinking some distance the veiu pinched so considerably that the miue was abandoned. While siuking the shaft and working the tin lode, the miners threw up considerable quantities of green stones, whicb they regarded as valueless. Subsequently two visitors, one a public school inspector, obtained several of these stones, which they regarded as beryls, but noticing that they were a deeper green than the common beryl, tbey showed them to one of the officials of the New South Wales Mining Department, who declared them to be true emeralds. Similar stones had previously been picked up by otbers, and supposed to be green tourmaline. Several of the specimens obtained were forwarded to Loudon, and shown in tbe New South Wales court at the Crystal Palace Mineral Exhibition, where they attracted much attentiou, although their color was eousidered too light compared with those from South America. In the meantime, the tin mine from which the emeralds bad beeu ohtained, having been forfeited by the original owners, unaware of its valuahle character, was taken up, with large additious of ground, hy a Sydney citizen who had recognized the importance of the find, and, ultimately, three companies were formed, during 1890 and 1891, for the purpose of working the ground. Professor David, of the New South Wales Mining Department, visited the mines at an early stage of their development, and reported that the gems were the first autbenticated find of emeralds in Australia, and that his researches led him to believe that they would continue to he found to the depth of 1000 feet. One of the companies has ohtained 40,000 carats of emeralds from its workings, the color ranging from light green to the well-known medium dark color. Another company has, while sinking shafts, ohtained a fine emerald, of a heautiful dark velvet green, weighing 40 carats, and proved the existence of the gem in large quantities in the grouud held by it; while the third company has found immeuse quantities of green and white heryls, and a few emeralds. The emeralds obtained are of all shapes and sizes, ranging from the thickness of commou needles to fully an inch in circumference. Tbe largest had a weight of 100 carats, and a considerable proportion weighed from 1 to 20 carats each. When it is considered that five or six years ago the existence of emeralds in Australia was practically unknown, these results will appear most remarkable; and there is every reason for helieving that, with the iutroduction of fresh capital and enterprise, emerald miuing will become a leading industry in New South Wales.

John Plummer.

Sydney, New South Wales, June 18, 1894.

A Miraculous Escape.

Frank Bagley, a miner, had a recent experience at the bottom of a 300-foot shaft in the Little Jessie mine near Prescott, Arizona, which the *Miner* says he never wants to go through again, and which no other miner would care to experience. His escape from instant death seems little short of a miracle.

He was engaged with a compauion in putting in four blasts, and when the work was completed, his companion climbed up a rope to a place of safety ahove, leaving him to apply the light to a fuse which was to explode the shots. He had an abundant length of fuse to give him plenty of time, as he supposed, to climb up to the timbered part of the shaft out of reach of flying rocks from the shots. The distance was only about ten feet, hut he had no ladder or aceount of the incouvenience of bandling it while shooting, and the only means of escape was by climbing a rope.

He applied the light to the fuse and started to climb the rope, but it was wet and slippery; and as soon as he made a few feet, his hold would give way and he would slip back to the bottom of the shaft, where four pieces of fuse were sizzling their way to as many sticks of giant powder. His first unsuccessful attempt did not alarm him much, as he had no fear of his ability to get away; but as he tried again and again, and each time to only again slide back to the bottom, he began to realize that his position was a very critical one.

He had blown out his light, and in the narrow confines of the shaft there was not a crevice or a projecting rock big enough to shield even his hand. The place was black as midnight darkness itself, and his only way of escape was through the agency of that slippery and treacherous rope. He knew about the time the explosion must inevitably occur, and as the time grew nearer and nearer the more desperately did he attempt to make the ascent, but all to no purpose.

The first shot went off, scattering rock in every direction around him, and hittiug him in various places ou the body, limbs and head. The second, third and fourth followed in rapid succession, but with less serious results to him. The injuries he sustained were mostly received from the first shot. He is lacerated aud bruised from head to foot, although none of the wounds were deep.

The Roanoke Mining Company.

Condensed from the Calaveras *Chronicle*.

The mining property of this company is near the head of Chili gulch, one mile southeast of Mokelumne Hill, and consists of 3200 linear feet northerly and southerly along a quartz lode, of which 1800 feet south is the Lamphear mine and 1500 feet north is the Moser mine. Tbe two properties have recently been capitalized for $200,000.

The underground work consists of a crosscut tunnel driven in from tbe side of the mountain 400 feet, at which point the vein was cut at a deptb of 85 feet from the apex of the lode aud near tbe center of the consolidated property. A lateral drift has been driven north along the vein 412 feet, all the way in quartz, which was put through tbe mill and more than paid the expenses of running the level. Several upraises were made from this level, all of which paid well. South of the crosscut tunnel a level 250 feet has heeu driven and is being pusbed ahead. At the point where tbe tunnel bas intercepted the vein, a prospecting shaft is now being sunk in the fissure of the vein at the rate of tbree feet a day. It is now down from the apex of the vein 130 feet aud from the tunnel level 45 feet. This sbaft is well timbered with square timber 10x10. The vein at the bottom of the shaft measures fully five feet of solid quartz of a ribbon nature, carryiug about one per cent of iron and galena sulphurets. The vein is magnetic north and south, and at the bottom of the shaft very nearly perpendicular, witb a slight dip to the west. It shows great regularity; the walls are well defined, and with the present development it shows 700 feet of an unbrokeu ore chute, which extent is remarkable for the present depth.

The work now heing performed in the mine is dead work. Tbe mill is kept runniug half the time with 13 men in the mine. A receut ruu of 32 days was made, the result of the clean-up being nearly $5000. The gold is very coarse, nuggets being found in the battery ranging all the way in value from $10 to $300.

This property helongs to the mother zone veius, although its polar treud differs slightly from the generality of the mother veins, caused by the protrusiou of the granite horse.

The mine is located within a few hundred feet of the head of a long and remarkable cauyon, known as Chili gulch—remarkable for its output of placer gold. Tbe canyon itself was very rich, and after it was washed out the sides or hanks were found to be overlaid with volcanic ash and beneath it auriferous gravel channels, from whicb millions of gold was taken out and which are still yielding quantities of the precious metal. Chili gulch, from its source to its outlet, passes through the mother zoue and empties into the Calaveras river a short distance above North Branch, on the road leading from San Audreas to Valley Spring, the canyon being over six miles in length.

It is a fact the world over that two-thirds of the rich mines of the world happen to be located at the head of long gulches or canyous. Instances—The Comstock mine at the head of Seven-Mile canyon; the celebrated Mono mine at tbe bead of Dry canyon; the Bingbam mines of Bingham cauyon, and the Emma and Flagstaff mines at the head of Cottouwood canyon in Utah; the old Gwiu mine in Rich Gulch cauyon, and also many of the celebrated mines of Mexico are located at the head of long canyons.

The Roanoke lode is inclosed iu slates. The footwall or west wall is metaphoric, syenitic and porphyritic slate. The hanging or east wall is the usual laminated slates of the zone, with many stringers of quartz cutting diagonally across the wall slates and hottoming in the lode vein at various depths, thereby enriching the veiu at the point of contact.

The Gunsight Country--Pima County, Arizona.

To the Editor:—An erroneous impression prevails that the Gunsight country is an inaccessible and waterless region, remote from supplies and generally a desolate desert bordering on Sonora, the "Land of Manana."

The shorter route is by way of Gila Bend, on the S. P. R. R., 85 miles; by Tucson, 120 miles. A natural roadway, generally hard gravel mesas, packing under travel until the detrital deposit of porphyry and granite, blending and cemented with volcanic ash and lime, rivals the best work of man. With good American mules a ton to the animal can be hauled.

The gold fields are situated in a metamorphic grey granite basin, in extent 13 miles by 4, the greater distance northerly and southerly, and hemmed in by detached porphyry mountains: an exceedingly interesting country to the mining geologist and an ideal topographical region for a mining camp; extensive grassed valleys with isolated patches of hills, hardly attaining the dignity of mountains; the Sonora, Mexico, boundary line 18 miles distant and 75 miles to the Gulf of California; an equitable climate, the heat of summer tempered by sea breezes, and at an elevation above sea level about 3000 feet. The geology of the country shows this low-lying hillock and higher granite hills to be much broken up and distorted; quartzite ledges from a few inches to two feet wide traverse the country, generally paralleling the quartz veins. They cannot be classed as dikes, as they are too irregular in their strike, at times intersecting the smaller quartz veins. In the lower country much common magnesian limestone of a sedementary nature occurs. I think simply as a surface deposit. Veins of quartz, some with a blending of fluor spar, having generally a northerly and southerly trend, many with an easterly and westerly strike exist, also interlacing feeders, and stringers of rich quartz. In places large blowouts of white and cream colored quartz show on the line of veins and a prodigal abundance of float, all of this quartz hornspooning well in gold. The Indians washed for gold in the bateo for years. No work of moment was attempted until the past year, just a surface gouging where little labor would accomplish much. On those veins carrying fluor spar the character of the ore will change, lead or copper coming in with depth with a good silver value—the gold not necessarily decreasing, but the character of the rock changing from a free milling, which it now is, to one requiring a different treatment.

The quartz is friable, in color a bluish white, and cream tinted, this latter the richer, much of it being honeycomb quartz, this oxidized iron variety very rich; black and brown hematite imprisons a high value in gold, requiring longer treatment in stamp mill battery and concentrators, this class likewise is rich.

Iron pyrites are rarely found, and occasionally patches of galena occur in those veins with the fluor spar blendings, and copper sparingly as an oxide and carbonate.

Water is abundant, and can be secured in any of the larger valleys at a depth from 500 to 800 feet; at other more favored points, as at the Ajos, in 30 to 40 feet dug wells.

On the Ide mine, shaft No. 1, dip to east 30 deg., quartz on surface filling the 6 by 4 shaft, this pay has pinched to 4 inches at a depth of 15 feet, where a slight faulting of vein occurs, the pay rock in 20 feet widens to half fill the shaft at 20 feet, and continues thus to pinch and swell to bottom of shaft.

A one-half to 3 inch rich pay streak goes down on the footwall that crosses, quartering, to hanging wall at 20 feet deep. The quartz, a fine milling grade from surface to floor of shaft, continues on one or both walls; enclosing walls granite.

A parallel lode on same claim is found in vein No. 2, a shaft 12 feet deep, width of vein smoothly in place 5 feet 3 inches, principally fluor spar, showing good colors in pannings; strike northerly and southerly. This opening, from shaft No. 1, 100 feet west. This is a strong vein cropping and traceable for miles. To south one-half mile is the Ontario. Shallow pits in limestone show a 2 feet vein, prospecting well in gold, gangue, quartz and fluor spar, carrying nuggets and kidneys of galena and yellow crystals of lead-molyhdates. The Cucumongo, same as Ontario in work and rock. A number of other claims, small surface cuts, exposing good milling rock, were visited, but space forbids mention. A shot-gun tramp over the undeveloped King Solomon, Oro Grande and Sierra Madre claims—Andrew Kozik, discoverer and part owner,—noting the huge outcrops and securing samples of rich honeycomb quartz that will run three figures in value.

The Montezuma Gold Mining Co., or what is locally known as the New York Company, are New York capitalists operating in Arizona, consists of six full claims in a block, the Dorsey having the greater development, with a shaft 54 feet deep; at 24 feet a slight fault occurred in vein, recovered in 2 or 3 feet, and continues without a break in the quartz vein from surface; but 4 inches wide to 12 inches in width, and increasing with depth. Three years ago Dorsey, the original locator, arrastraed $8000 from the open cut drifts and shallow workings now showing on pay, and recovered about one-third the true value of the rock. Unfortunately for both, probably, he killed an Indian and skipped over the border, the property lying idle until housed by Mr. Wheatley and associates. The lode shows for itself, tells its own story of rich rock in a strong vein, and approximates a mine nearer in point of development and value of rock in sight of any seen in this gold belt. The Aurora, an extension northeast, is opened by many cuts and shafts, showing same class of quartz and continuity of lode on its regular course.

Headquarters Camp is about one mile from the Dorsey westerly, and a mile north from the People's Co. camp, and carry the largest working force now in the district. Here we find the Enterprise group, under hond to Supt. Wheatley, with the California a half-mile distant to the east, cropping on mountain-side north and south; strike in line, porphyry and granite contact. The quartz shows some copper as a carbonate and specks of cuprite (red copper ore). Vein pinches and swells, as is expected in this broken formation, and, with exception of shallow pit to north, comprises development here. The Valley group has on the Raymond a 30 foot and 20 foot shaft, connected by open cuts for some distance. Ore arrastraed therefrom by Wall & Dickerson two years since; vein, 14 inches wide, arrastraed $30 a ton. tailings giving $50 per ton by assay. Seven claims in this group are under bond.

Wall & Dickerson have on the Grant a 25-foot shaft and other openings, from which they work by arrastra $40 rock; trend northeast and southwest, dip to east. Raymond (16-inch pay seam) and others, original locations.

In the valley, toward the porphyry belt of the Gunsight, in limestone and granite, two miles from People Co. camp, we find the America and Gold Rock. Shaft No. 1, 30 feet deep; shaft No. 2, 200 feet north, on 6 to 14 inch pay quartz. These claims have some rich croppings, and below surface gold patches of galena in gangue stuff, and some fluor spar leads to the belief that the quartz will be less free in depth, though not losing value of gold held necessarily. This should develop into a good property.

On the home swing a brief call was made at the Gunsight free-milling silver mine and mill, now in care of a keeper until the white metal shall have somewhat recovered its real worth. A complete 20-stamp mill plant, tank system, steam hoist, worked to 300 level and opened 200 feet deeper; a black spar, heavy spar (barite) and quartz is the gangue matter, silver chloride the mineral, with some kidney, high-grade galena. An 800-foot driven well, having 600 feet of water in it, five miles away, is pumped to mill and sold to stock men and miners.

There is gold in great quantity in this district on the surface, and if judiciously and economically worked, with a practical knowledge of mining geology as applied to this peculiar field, there should be paying mines found.

Borax Works in Operation.

The borax industries of California and Nevada represent an annual value of one million dollars. Like other coast products, this value is largely affected by pending tariff legislation. Following is a list of all the borax reduction works now in operation in the two States: Smith's borax works, twelve miles north of Daggett, Cal.; Searls, sixty miles east of Mojave, Cal.; Conn & Trudo, Saliua valley, fifty miles east of Big Pine, Inyo county, Cal.; Calm's, Columbus marsh, Esmeralda county, Nevada; Rhodes' marsh, on line of C. & C. R. R., near Bellevile, Nev.; State Line marsh, Nye county, Nev., 120 miles southeast of Candelaria; Schmidt's works, White Plains, Nev.; Neuschwander plant, sixty miles south of Lovelocks, Nev.

In the Mammoth-Champlain case at Provo, Utah, the effect of the decision is that the defendants are wholly enjoined from working the disputed ground lying east of the Mammoth 37 side line, and the plaintiffs are enjoined from working in that portion of the disputed ground lying east of the Mammoth 37 side line and south of a line parallel with the Mammoth 37 south end line, and passing through a point south of what is known as the apex cut. This excludes the plaintiff from a strip from about 80 to 100 feet wide and the full length of the disputed premises, and allows them to work the remainder.

Near Baker City, Or., the Virtue mine recently yielded a $9,000 clean-up; the Moores mine is kept running night and day. Ten stamps will soon be added to the mill, and a concentrating plant has already been added. A run is being made at the Sauger mine. Only about 100 tons of rock will be crushed for the present, but there is some prospect of the mine being operated on an extensive scale before long. The Nelson placer claim is running full blast with an abundance of water. The Robbins mine on Pine creek has started up again.

During the last week in June the mines about Hillshoro, N. M., produced 400 tons of gold ore, more than half of which came from the Standard.

More Amusing than Likely.

Some interesting fiction comes over the wires in press dispatches, often followed by denial; oftener lost amid the mass of matter. Under the guise of an alleged letter received by a Canadian, the following summer story is to hand:

Following is the alleged letter, which though written last February, has "just come to light:"

Guatemala City, British Honduras, Feb. 22, 1894.

Monsieur M. O. Nay, Toronto, Can., Dear Sir: In accordance with the by-laws of our organization, I have established all the necessary machinery on an island formerly known as Ruatan, belonging to British Honduras, which has no extradition treaty with the Government of the United States. Therefore, if we are discovered in our really philanthropic efforts to furnish the people of the United States with a proper per capita circulation of silver dollars, each one made of as much pure silver as the United States Government Mint uses, we could not legally be taken from this island for punishment to the United States. We have already purchased 100,000 pounds of silver bullion, 12 ounces to the pound, at less than 70 cents per ounce. We have the best possible dies in the world, and we have an honest, full weight, United States dollar of 412½ grains every time. It will not be a counterfeit, but a perfect facsimile and duplicate of the 412½ grain silver dollar which Uncle Sam is so penurious about coining and circulating among his nephews and nieces. Landing 100,000 pounds of silver, Troy weight, on the island, we shall have 1,200,000 ounces, which in grains make 576,000,000; and this divided by 412½, the amount of grains to go into each dollar of our free minting, $1,396,363. Thus we convert the silver bullion which cost us, at 70 cents an ounce, $840,000, into $1,396,363.

The net profit is $576,363, and the entire transaction has scarcely taken ninety days. The next step is to convert this silver into stocks, bonds and mortgages and sell them later on for gold, which will be taken to Europe. This ought to be accomplished during the summer and autumn of 1894.

The necessity for the most profound secrecy is obvious. The advocates of free silver, especially Senator Stewart and those who follow him, are also intent in their endeavors to rescue American commerce, manufacture and labor from the oppressive clutch of the gold bug standard and to restore the white metal—the poor man's money—that we are certain to have their continued support.

The Count of Monte Cristo was not "in it" for wealth as compared with the possibilities of this island at Honduras for the evolution of innumerable silver dollars of 412½ grains, each with a profit of 40 cents on every last one of them. It will benefit the laboring men of the United States, and also the farmers, who are solidly against a gold unit of value. This free coinage mint hidden in the far off island, will be a perpetual blessing and beneficence for all the millions of bread winners in the American union. It will accomplish what a monopolistic, capital ridden Congress failed to bring about. It will give them plenty of cheap money.

The literature in favor of free coinage should be kept fully up to its present high pressure. We need the words and work of Bland, Bryan, Jones, Stewart and Teller served burning hot every day from the rostrum and the public press. It would ruin the enterprise if the public ardor in favor of the white metal—the money of Hamilton and Jefferson—should be allowed to cool off at all. While the fervor is on we should melt our bullion, make and market our dollars, and prepare to retire in ease and luxury to some foreign country with the gold we have derived from their sale. Extradition cannot reach nor gold bugs and Wall Street paralyze our profits of 40 cents on each honest dollar thus coined.

By the first day of June we should have converted silver bullion amounting to at least $125,000 which would be smuggled into the United States by way of the Gulf of Mexico and the Gulf of California, via Guyana, Nogales, Kansas City and Omaha, converted into gold, and have deposited it to our credit in London. At Omaha there came near being an exposure. D. E. Seavior.

N. B.—Send your reply care of Pierce M. B. Young, Envoy Extraordinary and Minister Plenipoteutiary, Guatemala City.

The Resurrection Mining Company is about to resume operations on the New York group of claims in Big Evans gulch, on the Leadville, Col., gold belt. There are, says the *Herald*, twelve claims in the group, and from these the old New York Company took out $750,000 from the first contact. The new company will start in by lifting ore from the first contact and later on sink a shaft to the second, where the gold chute is known to exist. The mineralized property of the company covers eighty acres. Development will be pushed on a large scale, and with the aid of the best appliances.

In the Jicarilla mountains, New Mexico, gold in pay quantity is being found. A prospector says, "the mineral is a sort of talc, mixed with a decomposed rock heavily streaked with magnetic iron. The best pay comes from a blow out."

Southeastern Nevada.

In Lincoln, Nev., the *Record* says the mining industry of the southern portion of the county is coming to the front.

A deep cut has been run on what is known as the Big Ledge, situated one mile south of the Capital shaft. The cut is in thirty feet and taps the ledge at a depth of thirty feet: the ledge being about two and a half feet wide and averaging $50 in gold.

A load of ore from the Monitor mine has been shipped to the El Dorado mill as a working test and the result is eagerly looked for. The ore is carbonate; formation tracite and the veins run east and west and pitch to the north. The mines are but three miles from the Colorado river and a fine road can be made down a wash with but little expense. In the workings of former years no assays were taken for gold, and the silver value being too small to open up the claims, going only about four or five ounces, they were neglected.

About twenty-two miles from the Vegas ranch and on the road to El Dorado Canyon, a strike has been made by W. J. Stewart of the Vegas ranch. Samples taken from the croppings go from $10 to $100 a ton in gold.

The late trouble at the Keystone mine in Yellow Pine mining district over the thefts of ore ended in nearly all the men being discharged, and replaced by new ones. The company at present is working thirty men. They are down 400 feet. The Keystone mining company has two other claims at Shadow mountain, thirty miles from Keystone, in California, across the line. Two men took out twenty tons of ore in a week's time, and the teams have commenced to haul ore from here.

The mill is situated eight miles from the Keystone mine at what is now called Sandy City. Fifteen tons are put through every day and the average workings for the last three months have been ninety-six per cent of the assay value.

Some eastern capitalists are at present negotiating for the purchase of the Clementina mine from J. V. Keeley. The property is one of the best in Yellow Pine mining district and needs but capital to bring it to the front as a large producer.

The population of Keystone and Sandy is about fifty.

Crescent City is a new place that has sprung into prominence within the last year. It is situated in the southeastern portion of the county about 240 miles from Pioche, and fourteen miles northeast from Vanderbilt, California.

The Legal Tender Mining Company has completed a five-stamp gold quartz mill from the Fulton Iron Works of San Francisco, with a corrugated Frue concentrator, the capacity of the mill being fifteen tons a day. The engines and boilers were put in heavy enough, should the developments justify it to increase the number of stamps. At present only enough water is to be had to run five stamps, but work is going on to develop more if possible.

The company own some fifteen mining claims, but so far have confined their work to one mine called the Legal Tender, upon which two shafts have been sunk 200 feet and about 100 feet apart, connected at the 100-foot level with a drift run for ventilation. The vein averages four feet and the pay streak about twenty inches. Numerous drifts have been run, all showing up well and averaging about the same for the pay streak in them all. No stoping has been done, and the amount of ore taken out is about 400 tons of an average of $58.20 in gold per ton. Some work has been done on all the other claims and they all show pay ore. The company have been working twenty-five men nearly all winter and have about that many employed now.

A fair estimate of the amount of ore in sight in the Legal Tender mine is $200,000. The company have expended some $30,000 already and have just negotiated for the purchase of another mine at $12,000.

There are about 65 men in the district and a mail service is soon to be established between Crescent and Vanderbilt.

The Dam at Deguerre Point.

The Marysville *Democrat* says: The *Appeal* contains an article, evidently written by Geo. Ohleyer, in which the reader is informed that the matter is very significant as telegraphed from Washington, and that the people of the valley will never have peace, nor will the impending ruin to the rivers be obviated as long as it is proposed to mine by the hydraulic process and dump into the rivers with or without restraining dams. There is nothing unusual in the proceedings in the Senate Committee on Commerce in the proposition to appropriate $100,000 to improve the rivers, as it is strictly in conformity with the recommendation of Board of Engineers and the present United States Debris Commissioners. As we have heretofore stated, they have requested Congress to appropriate a sum of money to be expended in constructing a wall or dam at Deguerre Point which will restrain the debris now in the streams above that point.

Congressman Caminetti, Senators White and Perkins, and Congressman Maguire, favor said recommendation, and are working to get at least $100,000 with which to have the work commenced at as early a day as possible.

The work of the obstruction committee who visited Washington last winter, of which George Ohleyer was a member, retarded the work of securing an appropriation for a time, as they were opposed to it: but after they left the Capital progress was made under the efficient work done by the members of the delegation favoring it, the result of which is the recommendation of the Committee on Commerce that $100,000 be appropriated. The opposition, voiced by the *Independent* and *Appeal*, represents the sentiment of a half dozen cranks, who either have lost or fear they will lose an occupation, but does not in any sense reflect public opinion. These articles are an insult to intelligence, as in the accusations the Congressmen, Senators and United States Commissioners who favor the appropriation are accused of conspiring to obtain money from the Federal Government to be used wholly in the interest of hydraulic miners. We take occasion now to say that we have interviewed several prominent citizens as to the position taken by these journals relative to the contemplated work at Degnerre Point and that not one person approves the sentiments expressed, but they do favor the appropriation.

San Bernardino Prospects.

To the Editor:—A recent trip to the country lying between the Southern Pacific Railway and the Atlantic & Pacific in San Bernardino county convinces me it is destined, in the near future, to become a large gold-producing district and a desirable section for investment of capital; also that it is, at the same time, adapted to the interest of prospectors with small means, energy and pluck.

Gold predominates, but some ledges carry a percentage of silver. They are apparently well-defined veins as a rule, increasing in quantity and holding their quality, as development has thus far proved.

This country, like all isolated portions of the desert province, has been, and is now, comparatively unknown to any considerable extent, but is, I think, well worthy of investigation by those who feel interested in the mineral-producing sections of our State.

Some properties are being equipped with mill machinery with every prospect of fair returns. In the vicinity of Twenty-nine Palms, say within a radius of 25 miles, in any direction, there are well-formed veins of auriferous quartz, and other things being favorable, it seems to have a good prospective future. According to my judgment, from a geological standpoint, and although comparatively little has been done toward development, the indications for permanence are flattering.

To reach this district, take the Southern Pacific route to Banning; or if driving through, go to Whitewater, thence through the Morongo pass to Warren's ranch and onward to Twenty-nine Palms, where there is an abundance of water and fuel for camp purposes only.

As an illustration of what is now being done with prospect claims, I will cite one belonging to J. W. Parks, which he is pleased to call his "Summer Queen," six miles south of Twenty-nine Palms. He has followed his ledge for a depth of 45 feet, and from a small pay streak, richer than the balance, has cleaned up something over $1600, or about $40 per foot in depth, and has on the dump over 100 tons of ore worth something like $25 per ton. The tailings from his arrastra carry a considerable quantity of sulphurets worth running through a mill. The ledge at the cropping is about two feet thick and has increased to five feet at the bottom, with a well-defined formation.

Fuel is scarce, but the Utah Southern, also the Southern Pacific, have staked out lines in the vicinity which will ultimately provide for the necessary accommodation as soon as the traffic is in sight to warrant their building. T. A. Darling.

It is understood that under the direction of Mr. Walcott, the new head of the United States Geological Survey, that branch of the public service will strive to be what its name implies: that geology will be attended to and other things let alone. The idea is a good one, and if Mr. Walcott will act on it, his administration will be in brilliant contrast to the scattering tactics that of late years have tended to interfere with the usefulness of that important Government work.

The number of men now employed at the Cripple Creek mines, not counting men who are working for themselves, count up 1236, which probably exceeds the number at work in any other district in the State. The heaviest force, ninety men, is employed at the Pike's Peak. The Cripple Creek *Journal* says that from 1500 to 1800 men are engaged in prospecting, leasing, ore hauling and milling.

The New Kennedy Mines.

A miner writing to a local journal from the new mining camp of Kennedy, Nev., says:

Kennedy gold field, now the center of so much attraction, lies on the southeastern slope of the range running northeast from Cinnabar mountain, which again is about 20 miles southeast of the old mining town of Unionville. The town itself is pleasantly situated in a shallow canyon, and is well supplied with wood and good water. There are probably about 20 frame buildings and quite a number of tents scattered around, while a few primitive dugouts may be seen in such close proximity to the creek as to make one shudder for the occupants in case a cloudburst took place above. But this embryo town has, it seems, already got a skeleton to give it a set back. The ground on which the lots were taken up and in some cases houses built was subsequently located as a townsite, and now it is feared there will be litigation and what may be worse but not unusual where claims conflict and the arm of the law is weak.

The miners are very hopeful over the prospects, and '49ers, now (by a reversal of the figures) '94ers, were there celebrating what they reckon to be a return of the good old times. But without intending any prejudice whatever to the camp, the rush thither is more indicative of the really hard times that generally prevail than any unusual inducements in the shape of rich gold mines. That some of these exist has been amply demonstrated, but the ledges in general consist of low-grade, ferruginous ore, refractory in its character, and yielding from $10 to $35 of the yellow metal to the ton. The ledges are in a granite formation, which is considered a good indication that they will go deep down, and vary from several inches to several feet in width. Ore taken from a ledge which was tapped at about 100 feet from the mouth of the tunnel, upon being pulverized and horned out, failed to show any gold, but the owner stated that if tested at the forge the much prized metal would show up. The present mill failed to work the ore successfully, and this has been quite a drawback to the camp, as there being, with some notable exceptions, no shipping ore the miners have been unable to realize, and consequently money is scarce and progress slow. When, however, the new mill is put up and the ore is treated by such a process as will extract and save all the gold, then we will be able to form a better idea of the Kennedy gold field and its possibilities. Prospecting has been carried on very extensively, both on the east and west sides of the range, and the ground for a radius of many miles has been located. Prospectors here enjoy exceptional facilities, there being plenty of water and wood and excellent range for their horses.

Kennedy is about 45 miles from Lovelock by the nearest route, and the journey will occupy about nine hours with a good team when the road has been improved. Travelers are warned not to take the road by Say's canyon, as it is very rough and on the east side of the range very precipitous, passing at one place through a matted jungle of cherry bush, where horses and driver on emerging from the thicket may thank their stars if they have escaped without the loss of their eyes. The road by the canyon north from the Say ravine is said to be a passable enough one. A stage runs from Lovelock.

To those in search of employment there is no chance at present in Kennedy. The remark of a resident of the camp is significant enough on that score, and is here repeated: "That for each job there are more than five applicants."

The final argument in the famous case of the heirs of William Wood against J. B. Wheeler and the Aspen Mining Company is being made in the United States Court in Denver. The defense set up a question claiming the right of ore bodies on the Emma lode and mining claims by virtue of an apex within the surface lines of the Spar claim, which was also owned by the Aspen Mining and Smelting Company. The court held that no such claim could be set up by the defendants in the suit, and ruled out all expert testimony, maps and evidence which was offered before the Master in Chancery in support of the apex claim. Wood, with two others, was the original locator of the Emma mine. He disappeared before the real value of the property was known, and died in Canada. The other two owners sold their interest to J. B. Wheeler, who developed it into one of the richest mines in the West, when the Wood heirs brought suit for a third interest in the mine, as well as their share of what had already been taken out of it. The case has been in court for ten years, and the amount they claim is about $4,000,000.

The Denver *Record* says the largest mining deal of the season in San Miguel county has been consummated by Jas. Johnstone and O. N. Davis leasing and bonding the Roy Johnstone group of gold mining claims to Messrs. Beam, Chapin and Whiteman of Telluride for $150,000. The group is composed of 12 lode mining claims, bearing gold, and is situated in Prospect Creek basin, about six miles south of Telluride.

Gold is cited as the only thing that cannot be lessened in price by the action or inaction of Congress.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER IX.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

A ton of Virginia cannell coal yields products as follows:

Kerosene	25 gallons
Lubricating oil	10 "
Naphtha	10 "
Paraffine	10 pounds
Ammonia	10 "
Carbolic acid	10 "

And usually from 1000 to 1200 pounds of coke.

1855.—Two men, Eveleth of Maiue and Bissell of Louisiana, brought samples of crude mineral oil from Oil Creek, Pennsylvania, to Prof. Benjamiu Silliman Jr., at New Haven. Early in 1855 he made his report aud showed that the oil possessed high illuminating and lubricating properties, upon which the Pennsylvania Rock Oil Company was incorporated, which purchased oil lands at Titusville. Col. E. L. Drake was sent by Jas. M. Townseud to examine them. His report beiug favorable, a new company, "The Seneca Oil Compauy," took the place of the original, and Drake accepted the office of superintendent. The oil was at first gathered by digging trenches into which it flowed, blankets were spread as in early times, deseribed iu this history. When they became saturated they were wrung out and relaid. The supply being limited, Drake determined to bore into the earth for a larger yield. This idea was not uew, but possibly grew from the knowledge of the flowiug well in 1829 and the experience at the salt wells at Tarentum.

In 1856 Samuel Dowuer, a whale oil merchaut, erected works in Bostou and employed Mr. Joshua Merrill, a practical chemist, to experiment with hydrocarbon oils. Some 400 tons of Triuidad asphalt were consumed in these experiments. The first illuminating oil from mineral sources was produced at this time.

1857.—The manufacture of oil from albertite coal from Hillsboro, New Brunswick, was iuaugurated iu Boston, in Downer's works. Fifty stills produced 900,000 gallons of crude oil annually for four years.

1858.—Several hundred barrels of Peunsylvania petroleum were sent to Dowuer's works for refiniug. As the production of crude oil increased the use of albertite was diminished, and was wholly discontinued in 1865.

1859.—On the 29th day of August, 1859, the drilliug tools in the Drake well at Titusville, at a depth of 58 feet, struck a cavity from which the well filled up with crude oil nearly to the surface. A pump was rigged aud 500 gallons per day were lifted from the well. This was eonsidered a great suceess. With improved appliauces the supply inereased to 1000 gallons per day, worth oue dollar per gallon in the market. As barrels were scarce and the oil supply increasing, it was found impossible at first to store the oil. The system of storage tanks was soou after invented, whieh made the present petroleum trade possible. The total production of crude oil for the year was estimated at 2000 barrels.

The Drake well met with a misfortune. Something going wrong with the pump, the engineer entered the pit in the earth above the roek in which the well was sunk, with a lighted eandle. An explosion of gas followed, which burned the building and temporarily put an end to all operatious. Wheu spriug opened and the Seneca Oil Company resumed operatious, so many wells had been sunk that, instead of one dollar per gallon, the price of oil had fallen to oue dollar per barrel, with a limited market.

The crude oil was not suited for illumiuating purposes; the art of refining it was in its incipiency, suitable lamps had yet to be invented, and the whole busiuess was in a primitive eonditiou. Drinking water was contaminated with oil to such extent that a barrel of drinkable water brought from a distauce was at one time worth more than a barrel of oil. But these difficulties were at last overcome, until at the present time there are but few great natural produets managed with more skill, judgment and ecouomy.

From this date until 1886 the increasing production of oil aud the wild speeulative excitement which followed were considered one of the wonders of the age.

There were extensive coal oil distillation plauts still in operation in Virginia, Kentucky and Ohio. The kerosene works on Long Islaud, New York, were operated on a very large scale, the daily produet from which was estimated at 5000 gallons, or 1,500,000 gallons per annum.

1860.—The first flowing well was developed, after which for a time the supply exceeded the demand, and oil was sold as low as five ceuts per barrel. The Hamilton-McClintock well, two miles north of Oil City, Peunsylvania, began to spout petroleum at the rate of 60 gallons per minute or equal to 2160 barrels in 24 hours. People were astonished at the strange sight—a geyser of oil which could not be controlled or the produet saved, for most of the oil went to waste. A pond 25 square rods in area is said to have filled. In September of the same year, a most intense excitement arose at Oil Creek. The Dom Pedro well burst into an eruption of petroleum. During the first 24 hours it flowed 4000 barrels, and continued at nearly the same rate for a long time. The excitement increased to an extent before unknown. A newspaper published in the oil regiou about that time contained the following:

"So much oil is now produced that it is impossible to care for it, and thousands of barrels are running into Oil creek. The surface of the Alleghany river is covered with oil for miles below Franklin. Some wells are being plugged to save productiou. Fears are entertained that the supply will soon be exhausted if something is uot done to preveut the waste. Our water ways and farms are saturated so deep with the surplus of this dangerous fluid that vast fires are also to be feared."

1861.—A well in Veuago county, Pennsylvania, begau to flow mineral oil; 100 barrels were filled during the first 16 hours, when, there being no more storage room, it was reluctantly allowed to run to waste. The Phillips well at Oil creek commenced to flow, yielding the first day 4000 barrels. After this, spouting wells ceased to be a novelty. During this year oil begau to be shipped down the Alleghany river in barges and flat boats.

1864.—The great oil works of James Young at Addiewell near Edinburgh, Scotland, commenced operations. The compauy raised an immense quantity of bituminous shale, or shaly coal, from pits near the works. The production of petroleum in the United States had not at that time been felt in Europe.

1865.—Up to this date more than 1000 teamsters did a thriving business in hauling oil in barrels and the empty return packages, sometimes receiving as high as $3 per barrel. When during that year the first pipe line was laid, they were almost suddenly thrown out of employment, aud it is little to be wondered that they rose in riot against the innovation and that armed guards were necessary to protect the pipes from their fury. Many oil wells were sunk in Pennsylvania, three-quarters of which were unproductive, yet the yield of petroleum was very great. Col. Roberts of New York invented his torpedo, by which dry wells were sometimes made productive and exhausted ones restored.

1871.—The oil works of James Young near Edinburgh were doing an extensive business. They covered an area of 50 acres and gave employment to 1500 men. The products were valued at $5000 per day. The plant ineluded 354 distillation retorts with a capacity of 3000 tous of shale per week, equal to 120,000 gallons of crude oil, which yielded 50,000 to 60,000 gallons of illuminating oil, about 12 tons of refiued paraffine oil and a large quantity of heavy lubricatiug oil each week. Several tons of sulphate of ammonia were reeovered from the ammoniacal waters. Each ton of shale mined at Addiewell produced from 30 to 40 gallons of crude oil and 3500 cubic feet of gas with the eonsumption of only 280 pounds of coal nsed as fuel. About 500 tons of paraffine candles were anuually produced. At the same time sulphuric acid was made at these works from pyrites, 36 tons of pyrites being eonsumed per week (American Exchange and Review, Vol. XX, fol. 286).

From 1865 to 1874 many spoutiug wells were opened and speculative excitement ran high. After this the oil industry was reduced to an ordinary business, and the excitement quieted down or burned in different ehannels.

1879.—The first tide-water pipe line was laid from Bardford to Williamsport on the Susquehanna river in Lycoming county, more than a hundred miles distant.

When the prescut bounteous deposits of petroleum wholly fail or greatly diminish, as in time they certainly will, we still have the shale and lignites to return to and the experienee gained will be of great service. While the yield will be smaller, and the cost of production greater, we shall probably never—at least uot for a loug time—return to or wholly depeud ou the whale fishery for a supply of illuminating oil.

The lesson learned during the profusion of gas and petroleum will serve well when the excess is exhausted. Instead of outfitting ships to brave the perils of Arctic seas, man will retort coal, asphaltum and bituminous shales and turn eoal waste, lignites and crude petroleum into gas and coke, the former to be employed both for heating and illuminatiou, and driving gas engines, aud the latter as a elean and economical fuel. The time when all will be exhausted is too far distant to be of interest to the present population of the earth.

(To be Continued.)

Opal Mines Deserted.

The Nampa, Idaho, *Leader* says: Reports from the Owyhee opal fields are anything but eneouraging. Not a man left iu camp and the visitor may enter mines and earry away what he finds. What a pity it is indeed that these stones canuot be marketed, for it is an undisputed fact that they surpass anything in the opal line in the world. The famous Shirley mine, from which the opals that took first prize at the World's Fair were takeu, has also been deserted, and, although the mountain contains gems enough to supply the world—and of the rarest beauty, too—has not as much as a "keep out" notice posted up to warn off the inquisitive prospector. Only a short year ago there were probably a hundred men in camp, and many of them possessed a can full of these beautiful stones, that would have dazzled the eyes of a native from the great opal fields of Central America, and which had a commereial value of from $3 to $35 per karat, yet no buyers could be found; and now these men are working rockers on Snake River, barely making a liviug. It is to be hoped that there will yet be a demand for Owyhee opals and the fondest hopes of those who own the claims may be fully realized.

A Placer-Working Machine.

J. A. Elliott of Butte, Montaua, is the inventor of a machine for working placer gronnd, which is described iu the *Inter-Mountain*. A machine ten feet high and three feet wide has been built for experimental purposes, and the results obtained from the practical working of ground in the vicinity of Butte have been very gratifyiug. On the frame work of the machine are suspended three paus six feet long aud 20 inches wide, with riffles at the bottom, and connected together by two straps. These pans are given a rotary motiou by eccentrics connected to the main shaft. A crank placed on the main shaft gives the pans an oscillating or rocking motion, or as a placer miner would say, a "hen-wallowiug motiou."

These pans are placed oue above the other, in such a way that the fine gravel falls from the first to the second and from the second to the bottom or amalgamating pan. The water is carried to the top pan by the aid of a simple double-acting pump, which is run by a walking beam connected to the main shaft. The water passes through each pau and falls to the bottom, where it can be collected and used over again if necessary.

The gold-bearing gravel to be worked is first shoveled into a "boot" or box through which a belt fitted with elevator cups runs. This elevator carries the gravel to the top and deposits it in the upper pan. Here the coarse and fine gravel is separated, the fine stuff being carried by the water through a screen to the secoud pan, while the coarse gravel is dumped overboard. Auother separatiou is effeeted in the second pan, and the fine sand and gold passes through another sereeu with a finer mesh into the amalgamating pan. This pan discharges its contents into a tank, where the water scttles and eau be used over again Wheu the gold-bearing earth gets to the third tank it is pretty well concentrated, aud ean easily be collected with quieksilver.

The inventor claims that with a horse power he can run through 50 tons of gravel per day, and that finer gold can be saved this way than by any other method. It is claimed that a miners' ineh of water is all that is necessary to work ground with this machine. In shallow diggings the maehine can be moved close to the work and the tailings can be dumped to one side as work progresses. The whole maehine weighs only about 800 pounds, and it can be carried across the mountains with very little trouble. No cog wheels or gearing are used, the whole action being accomplished by means of chains and sproekets.

Mining Machinery in Honduras.

Writing from Amapala to the British Foreign Office, Consul Rossner gives the results of his inquiries into the trade relations betweeu Honduras, the United States and Great Britain. He states that while Euglish products hold their own in most instances, it is in maehinery and general ironmougery that the American manufacturers are making the greatest inroads. This is particularly the case with regard to mining maehinery, in whieh the Americans turn out a product better adapted to the work required. In reference to this, Mr. Rossner asks: "Is it possible that our manufacturers eaunot make mining machinery that will compete to advantage with like maehinery made in the United States? I cannot bring myself to believe such to be the case; but when I see steamer after steamer, month after month, unloading tons upon tons of Amerieau machinery at this port, I cannot help believing that there is a business defieieney somewhere on the part of our manufacturers that should be looked into aud remedied as quiekly as possible. The same is beginning to be the case regarding edged tools. In former years Hondnranean artisans were eontent with almost any kind of an ax, saw, plane, or chisel, providing the priee was suffieiently low to please them, but they now begin to demand a better elass of tools, and seek quality regardless of price. American edged tools appear to be promiueut as regards quality and temper, but Germany is biddiug for a share of trade in this line with a stubbornness that bids fair to be successful, while our own manufacturers seem to be eontent to manufacture what gave them good results in the distant past, forgetting that others, with less facilities, are striving continually to improve."

Scientific Progress.

Liquid Chlorine.

The critical temperature of chlorine gas, or the temperature below which it must be cooled before it can be liquefied by pressure, is about 33 deg. C., so that this gas may be counted among those which are easily converted into liquids. Faraday first produced liquid chlorine, and described its color as dark greenish-yellow; its specific gravity was afterward determined to be 1.33, and its boiling point 33.6 deg. C.

It is very propable, however, says *Knowledge*, that Faraday little dreamed of liquid chlorine as an article of commerce to be bought and sold by the hundredweight. He would, we imagine, have been rather hard put to it to suggest a material for the condensing pump and reservoir; though in respect to his memory be it said that a very few experiments could not have failed to furnish him with a solution to the problem.

The difficulties attending the production of chlorine, and the impossibility of transmitting it in the gaseous state, have combined to render chloride of lime in this country, and chloride of soda (*eau de javel*) in France, the only forms in which this indispensable bleaching agent can be put upon the market. When it is remembered that chloride of lime at its best does uot contain more than 38 per cent of "available chlorine," the advantage to be obtained in the matter of freight by transporting pure liquid chlorine instead of bleaching powder will be apparent. The actual manufacture of liquid chlorine is now beiug undertaken by a firm of alkali makers at Salindres, the process being conducted as follows, according to M. Fribourg:

The eondensing pump is provided with a piston of sulphuric acid, as being the packing best fitted to withstand the attack of the chlorine. To render such a piston effective, a pump of peculiar construction is of course essential. This takes the form of a U-shaped tube of cast iron, lined with lead. The limb of this tube which is to receive the chlorine is partly filled with strong sulphuric acid, while the other limb contaius petroleum oil, and is provided with an ordinary piston. The upstroke of the pistou raises the petroleum, lowers the sulphuric acid, and allows the chlorine to flow into the vacuum thus formed, through a side tube provided with a leaden (?) valve; the downstroke compresses the ehlorine through another pipe iuto the refrigerated receiver, re-entry into the generator being prevented by the leaden valve.

Such is the somewhat bald information concerning the compressing machinery, with which we have at present to remain satisfied. The receivers iu which the liquid is transported are wrought iron or steel cylinders, the necks of which are furnished with T-pieces carrying two bronze valves, the one connected with a tube reaching to the bottom of the receiver aud destiued to serve for withdrawing the liquid chlorine as such, the other serving for the withdrawal of gaseous chlorine. The cylinder weighs some 225 pounds, aud is capable of containing one hundredweight of liquid chlorine, or nearly 525 cubic feet of the gas. The pressure in the cylinder is 10 atmospheres at 35 deg. C., but they are tested up to 100 atmospheres. The anhydrous chlorine has no action on the iron, brouze and lead fittings.

It is proposed to sell small cylinders containing 10 pounds of liquid chlorine for experimental use, so that the chemist may look forward to a day in the near future when his gas-generating flask shall be shelved once and for all, and his oxygen, hydrogen, nitrogen, carbonic acid, sulphurous acid, ammonia, chlorine and sulphureted hydrogen be at hand, each in its steel or glass cyliuder.

COAL TAR, formerly considered a waste and a regular nuisance to gas-workers, is now utilized as one of the most valuable color-producers. Chemists have extracted from it sixteen shades of blue, the same number of various tints of yellow, twelve of orange, nine of violet, besides numerous other colors, shades and tints. A late magazine writer in summing up an article on "Uses of Coal Tar," says the amount of coloring matter stored in coal is so great that one pound of the common bituminous variety will yield sufficient magenta to cover 500 yards of flannel, aurine for 120 yards, vermillion for 2500 yards, and alizarine for 255 yards of Turkey red cloth.

Few Teeth Pulled Now.

In the course of an address at a dental convention recently a delegate remarked that there is not one tooth lost now where there used to be 100. The day of reckless tooth pulling has passed. It is a mighty poor tooth that the skilled operator of to-day cannot render far better and more serviceable than the best possible false one. If only the root is left a new upper part of porcelain or gold, called a "crown," is fastened upon it so as to be quite serviceable. Supposing that not even the root is left, a gap in the mouth is filled iu with one or more "dummies," securely fastened by a gold "bridge," or otherwise to the sound teeth. Complete sets of false teeth are rare nowadays. On the other haud, people in a palpably toothless condition are almost never seen, the cost of a complete artificial dental equipment being only $16. The demand for "tooth-crowns" comes largely from baseball players, football athletes and bicycle riders, who are very apt to have their teeth broken off short.

But the last and most ingenious resort of the dental surgeon is "implantation," *i. e.*, the setting of new teeth into the jaw. For this purpose real teeth are employed, and not artificial ones. Cocaine having been first applied for producing artificial anæsthesia, a hole is drilled in the jawbone, and into this socket a good tooth newly drawn from somebody's jaw is set. If the patient is young and vigorous the osseous structure soon closes arouud it, and by the time the gum is healed the tooth is ready for use. It should last from three to ten years. In the case of an elderly or feeble person it may be fastened in place by silver wires passing around the jawbone.

The root of a freshly extracted tooth is covered with a delicate membrane called "pericementum," the vitality of which materially assists the wished-for combining of the tissues. Unless the grinder is directly transferred, the vitality of this membrane must be artificially preserved. One way of doing it is to graft the tooth temporarily into the comb of a cock, that part of a fowl beiug well fed with blood, as may be seen from its redness. When wanted for use it is cut out. Ordinarily the patient is obliged to wait for awhile until until the dentist has a suitable tooth freshly extracted, unless he chooses to hire somebody to sacrifice one.

MICROSCOPICAL RESEARCH has proved that the pores of wood iuvite the passage of moisture in the direction of the timber's growth, but repel it in the opposite direction. This accounts for a pheuomeuon which is often noticed, and which puzzles a good many people—namely, why two pieces of timber sawn from the same section of a tree sometimes appear to possess very variable degrees of durability. If the wood, say of a gate post, is placed right end up, the moisture of the soil will affect it, but the rain falling on the top will do little harm; if, on the other hand, the butt end of the tree is put uppermost, the top of the post will decay, because the moisture of the atmosphere will penetrate the pores of the wood more rapidly in this position. Many people have noticed that the staves in a wooden tub appear to absorb moisture irregularly, some getting quite sodden while others are comparatively dry, and apparently almost impervious to moisture. In this case the dry staves are in the position in which the tree grew, while the saturated ones are reversed.

Educational.

INSTRUCTION BY MAIL

In ARCHITECTURE; ARCHITECTURAL DRAWING; PLUMBING, HEATING and VENTILATION; BRIDGE ENGINEERING; RAILROAD ENGINEERING; SURVEYING and MAPPING; ELECTRICAL ENGINEERING; MECHANICAL DRAWING; MECHANICS; ENGLISH BRANCHES, and

. . MINING . .

Diplomas awarded. To begin students need only to know how to read and write. Send for FREE Circular of Information, stating the subject you think of studying, to **The Correspondence School of Mechanics and Industrial Sciences, Scranton, Pa.**

4000 STUDENTS.

HEALD'S

Business College,

24 Post Street, - - - San Francisco.

FOR SEVENTY-FIVE DOLLARS

This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,

Surveying, Architecture, Drawing and Assaying,

728 MARKET STREET,

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL NOTES.—*Record:* .There are thirty men at work on the Mayflower properties.

J. R. Tregloan is keeping ten stamps of the South Spring Hill at work on surface rock from the Mediam. The shaft at the Mediam is down about 80 feet.

Repairs at the Hardenburg are still in progress. The mill will soon he in first class order. A reservoir has heeu constructed on the hill ahove the mine to be used as soon as work is resumed. The intention is to sink a winze 200 feet in the north drift 600 feet from tbe shaft at the 800-level, for prospecting purposes. A compressor will be put in to furnish power for the hoist at the winze.

The Gover mine is still in charge of the Sheriff wbo upon order of the Superior Court has two keepers and four men at work keeping the water out. The Sheriff is cleaning up the sulphurets to send them to Voorheis and Barney's reduction works at Drytown. Lane and Haywards of the Utica have made the owners of the Gover an offer for the property which they are considering, and which it is probahle they will accept. Lane and Haywards own the Hazard mine which joins the Gover and have for some time heen considering the advisahility of opening up that property, consequently the ownership of the Gover will give them an opportunity of developing the Hazard through the Gover shaft at far less expense than otherwise would he possihle.

Record: The Pioneer mine is reported to have struck a splendid body of ore.

The owners of the New London mine adjoining the old Plymouth Consolidated are preparing to commence operations in that mine on an extensive scale.

Ground was broken for the foundation of the new twenty-stamp mill at the Pioneer mine, uear Plymouth, last Monday. Work will he pushed ahead as rapidly as possible.

Superintendent Jones of the Bay State Mine says the developments on the 500 level of that mine, as the drift is extended on the ledge, shows improvement in width, being now fully 10 feet, and the quality of the rock is fully up to the standard, some $50 per ton.

A rich body of ore has lately heen struck in tbe main shaft drift on the 800 level of the South Eureka mine. It was at first a narrow seam hut a few inches in width, hut it has now widened out until it is four feet or more in thickness.

At the Wildman mine the thirty stamps are kept husy crushing the rock from the south drifts on the 1200 and 1300 levels. No stoping is yet heing done. On the 1300 level crosscuts have been run showing the ledge to be fully 20 feet in width, and as the drift is extended to the south a steady improvement in the quality of the rock is shown. On the 1200 level tbe rock is as yet of low grade, but the main drift on that level lacks some 150 feet of heing so far south as on tbe 1300.

Inyo.

THE TIPTOP.—*Register:* This is the appropriate name given a mine on the extreme summit of the Sierras about seven miles from Round Valley. It is estimated, from the timher-line indications, to he at least 12,000 feet high. Messrs. S. Thompson and Scbee Bros., of Los Angeles, have honded the property for $10,000, the bond running until December, 1895. Tests of the ore give results as higb as 325 ounces silver and $18 gold per ton. The average of the ledge, whicb is about twelve feet wide, is nearly or quite 80 ounces silver and $12 gold.

Siskiyou.

MINING NOTES.—*Journal:* The ten-stamp mill at the Shroeder mine on Deadwood mountain has started up.

Tbe Austin & Co. blue gravel mine at Greenborn continues to pay, the weekly yield ranging from $900 to $1300. Twenty-one men are emyloyed. The expense amounts to $400 a week. The blue gravel deposit extends across a channel over 200 feet in width.

The Klamath-river miners are discouraged on account of the river keeping up high so late in the season. It has not fallen more than five or six inches since last March, which greatly interferes with efforts to wingdam for tbe purpose of sinking dowu in the river hed to the rich paying chanuels. It is douhtful whether any of the compauies will be ahle to commence boisting before August, which will make the river-mining season very short, as the boisting is generally commenced hy the middle or last of June at latest.

MINING NOTES.—*Journal:* W. H. Crawford and M. Schultz have been at work the past two months putting in a 16-inch flume over 1200 feet in length, and building an independent bridge across Scott river, to carry water from Mill creek to their claim on the west side of the river. They expect to he ready to raise pay gravel this week. They realized good pay for the last month's work last fall, when the high water drove them out, and the uew improvements now completed place the claim in good shape for working all the time.

Klamath river is now falling gradually, as the late warm weather has melted off the snow from the Siskiyou and coast range of mountains to decrease the supply from that source. The stream is almost to its usual summer stage, which will enable the river miners to commence sinking behind their wing, head and foot dams witbout danger of the pits flooding, although they are over a month later than general in hoisting pay gravel, on account of the great quantity of snow last winter.

Mr. Clark, an old Humbug creek miner, had three and a half tons of quartz from the Uncle Sam quartz mine, on Middle Fork of Humbug, crushed last week in the Orr mill, which realized $56 to the ton. This mine was abandoned a year ago as heing worthless. He was unable to sink down farther on the ledge, on account of water, but will he ahle to do so later on as the water dries out, and can also start a pump in keeping the shaft clear of water. The great fault in working some of our quartz mines is in runuing the gold off with the quicksilver—a fact demonstrated hy many persons panning out considerahle gold from tailings helow the qartz mills.

Austin & Co., of the Greenhorn blue gravel mine, still continue to take out ahout $1000 a week, and sometimes more. Prospecting tunnels are to he extended toward the bill in search of a back channel and also down toward the creek. Should no pay channels he found in such efforts, the work will be continued in the present channel and a new shaft sunk down at the old works above, where a large extent of good pay gravel is known to exist. Newt. Lamh, who has opened a claim farther up the creek, will also soon he ready for taking out pay gravel.

Tidings: Over on Horse creek, a tributary of the Klamath river, in Siskiyou county, some very rich gravel heds have heen discovered this summer, and there is considerable excitement over the find among old miners in that region. The stream heads in the Siskiyou mountains southwest of Beaver creek. Its bunch grounds are not extensive, and are already well covered with claims, most of them located by Yreka men. Some miuing and much superficial prospecting has heen done on Horse creek in years past, but the rich diggings now found were not thoroughly tested.

Record: Mr. Rader, who has taken $8000 out of pockets in a rich vein on the stage road between Hornbrook and Yreka, took out another $100 in a day or two with a mortar. Dr. Taylor has an extension on his ledge. Crooker Bros. are ahout completing their wing dam at Anderson's Klamath river ferry. Horn, Smith & Co., one mile farther down, are rapidly completing their wing dam. W. R. Price has bought the Oregon bar and is rafting lumber for a wing dam. The American Bar Company, who run their wbeel over a suspension hridge, are getting ready. C. B. Gillson & Co. are husy piping their blue gsavel.

Trinity.

COFFEE CREEK.—*Journal:* Tbe Underground Treasure Mine, helonging to P. Holland of Trinity Center, is in the bed of tbe creek, which is a deep and narrow canyon. The owner has constructed a reservoir; the dam of which is 75 feet long, 30 feet wide at the hottom, 20 feet wide on the top and 16 feet deep; the gate is a self-shooter 12x14 feet and discharges 30,000 inches of water for about five minutes. This immense mass of water rushes down the narrow creek, which has a grade of 14 inches to 12 feet, with tremendous velocity, turning over immense houlders of many tons weight. He has found one piece of gold $290 in value, one of $212, one of $175, and twothirds of last year's product ranged from $2.50 up to $50. This Coffee Creek country is essentially a coarse gold country.

A HANDSOME CLEANUP.—*Journal:* At the hank of C. W. Smith this week we were shown two gold bricks of the value of over $3000, tbe result of 11 days' crushing at the Enterprise mine, East Fork. The ore was crushed in a five-stamp mill. Tbe company, which is composed of J. L. Day, J. R. Balch and Chas. Lobdell, are naturally highly elated over this good showing. A well-defined ledge, 18 inches to 4 feet in width, has heen struck in the mine. The ore is very rich, and frequently cleanups like the one mentioned may be expected.

NEVADA.

Ferguson District.

Lode: The small amount of work done in Ferguson district has demonstrated the fact of true fissure veins running through the country, with pockets and kidneys of high-grade ore. These deposits are found in the quartz between tbe quartzite and porphyry. From the beginning of the mineral belt, which commences a little west of the Monkey Wrench mine, at which point the lime formation ceases, we find a section demanding the most careful study. Apart from the Magnolia, the other ledges are similar in character, and require frequent tests and careful attentiou. In many instances the ore taken from one mine, tbough similar in character, varies greatly in the assay value. In some cases the manganese accompanies the pay ore, and it is not uncommon to find veins running in opposite directions, but dipping toward the main lode. The mineral helt seems to run from the Monkey Wrench to the Gold Eagle mines, centering upon the Jim Crow, Monitor and April Fool groups, running northerly and southerly, and heing several hundred feet in width.

Sterling District.

The parties who recently purchased the Sterling district mines have orgauized a company in Salt Lake, with a million dollar capitalization, to work the properties. It is reported tbere are several carloads of water pipe, besides other machinery, on the way from Salt Lake to tbe miues. The shares are of a par value of $10 each, and the officers of tbe company are as follows: Orsen Smith, president; J. E. Langford, vice-president; Hugh J. Cannon, secretary and treasurer. These, with the additiou of A. H. Woodruff and Hyrum Smith, form the directory, who will serve until July 1st, 1895. The properties consist of ten mining claims, situated in Sterling and Montgomery districts, Nye county, being formerly owned by Mackay Bros. and John Roeder.

COLORADO.

SMELTING IN THE SAN JUAN.—Rico *Sun:* The plants of the San Jnan Smelting and Miniug Co. and tbe Standard Smelting and Refining Co. at Duraugo have been supplemented by the two matte furnaces of the Rico and Silverton smelters. The Silverton smelter draws its main ore supply from Red Mountain mines. These—the Guston, National Bell, Yankee Girl and others—produce mainly one class of ore—a low grade copper hearing pyrite. Of such ore there is enough hlocked out in two of the Red Mountain mines to supply two or three matte furnaces of the Silvertou smelter's capacity. It is probable, however, tbat there will he difficulty in obtaining a sufficient quantity of silicious ore. The Silverton mines carry for the most part either small veins of higb grade ore or large lodes of lead-hearing ore—both classes of material heing unsuitable for fire concentration by matte smelting. In Rico the reverse conditions obtain. There is a good supply of low grade silicious ore hut a dearth of copper-bearing pyrite. This want has been remedied by the shipment of ore from Red Mountain. The Yankee Girl mine is sending ahout three cars per week to Rico from Red Mountain, through Silverton and past the very doors of the Durango smelters. Turning to the latter we find that their receipts of ore are such as to permit of the operation of only a small part of their plant. Tbe San Juan smelter was compelled during the past week to use sandstone in lieu of silicious ores. As to the Standard it has been found that the supply of copper ore is so uncertain that though originally intended to he exclusively a copper plant it has heen fouud advisable to add a lead furnace.

IDAHO.

PLACERS AT WARRENS.—Lewistou *Teller:* Ex-Governor N. B. Willey has made a sale of a large tract extending up Meadow creek from near the mouth of Steamboat to the hamlet of Warreus. In all, about 130 acres of placers are iucluded in this deal.

Of individual holdings iu the tract, the largest are probably those of George Riehold, embracing forty-seven acres, and including, amoug other claims, the old Bill George that paid handsomely. From this the richest pan of gravel in the district was obtained—ahout $32 worth of gold. Daily cleauups of $545 were made on this claim on a short run after the regular season was ended, the gravel being thawed out by fires. When Mr. Willey first went to Warrens in 1864 he bought an interest in the old Empire claim, in the bed of the creek, and from wbich he and his partuer took out $80,000 iu a few years. They sold it for $2000, thinking the claim worked out, hut the purchasers recovered $100,000 in gold from the same ground in seven years.

PLACER MINING ON PAYETTE.—Boise *Democrat:* The hanks of the Payette are lined from Emmett on up with men rocking for gold and making from one to four dollars per day. The best dirt will he found when the river is at its lowest stage, the miners following down the receding water with their rockers. Several different kinds of rockers are used, some having copper plates, some hurlaps, some blankets, etc. Like the Snake river product, the dust is so fine that considerahle of it is lost. It is so light that a grain of it apparently big as the head of a pin left in a pan to dry will float when water is poured in. A spot may prospect well this year, and he far richer or give up nothing the next. The high water deposits the lighter particles on the banks and hars, while the heavier is left here and there on the hottom of the river. It is on this theory that steam dredges were introduced on the Columbia, and their success led parties to commence preparing to give it a test at Marsh, ten miles above Emmett. The company is now hauling the lumher for the purpose of huilding dredges, etc. They say, however, tbat the ground which they recently honded prospects well enough to justify them in taking hold without working the hottom of the river.

DREDGERS FOR PLACER MINING.—*World:* The two mining companies who have bought placer ground at and near March & Ireton's have ordered 100,000 feet of lumber and bargained for 150,000 feet more. Boats are to be constructed with the lumber. Placer mining with hoats will he new in Boise county. Steam dredgers will be used and the dirt lifted onto the boats. This company will work the hig flat ahove Marsh & Ireton's, They will begin at the river and, of course, as tbe ground is worked the water will flow in to fill the space of the removed ground, and the hoats will constantly be able to float as the work goes on. Twenty tons of coal per day will he required.

NEW MEXICO.

COCHITI DISTRICT.—Cochiti *Call:* Machiuery for the Bailey stamp mill at Allerton is all on the ground and is being put in place.

Rich veins of gold ore that underlie Gold Hill continue through Colla, Pino and Medio Dia canyon and cover a territory at least five miles square. A majority of the rich strikes made the past ten days have been made outside of Gold Hill.

SOUTH DAKOTA.

GOLDEN REWARD.—Deadwood *Times:* At the recent meeting of the directors and principal stockholders of the Golden Reward a large amount of business was transacted, of interest not alone to the company but to the Black Hills in general, chief among which was the decision to double the capacity of their works by the erection of a cyanide plant capable of treating 100 tons per day, plans and specifications for which are now nearly completed. The crushing capacity of the present chlorination works will be increased by the addition of a uew building now under construction to accommodate new sets of rolls and screens.

It is not yet known whether the MacArthur-Forrest process will be adopted iu the new works or not. Experiments were made last fall by the Golden Reward Company relative to the precipitation of mineral from the cyanide solution to or on copper plates hy means of electricity; the test was on a small scale but proved eminently satisfactory. Should this method be adopted, it will revolutionize the cyanide process in the Black Hills at least, as by it the zinc shavings used in the MacArthur-Forrest process are entirely done away with, thus reducing the cost of treatment to that extent. Tbe Golden Reward Company have an immense reserve supply of ore in their various mines, carrying gold and silver in almost equal proportions, none of which the company have attempted to treat in their chlorination plant from the fact that the gold only could be recovered by that method. The mines controlled by the company have an unlimited supply of pay ore in sight, and instead of diminishing as the work progresses on them, the shoots become larger and better defined. The new works will necessarily increase the number of employes hoth at mines and mills, and thus benefit the entire commuuity by a large increase of tbe monthly dishursement on labor account, as well as material and supplies obtainable from our local merchants.

MONTANA.

GRANITE BUTTE DISTRICT.—*New Northwest:* A recent clean up after a two weeks' run at the Prize mill, near Granite Butte, in the northern part of this county, resulted in a $6000 retort. Tbe mine has been developed to a depth of 200 feet and drifts are heing run on both tbe 100 and 200. The vein is described as a true fissure varying in width from three to eight feet. Granite Butte is comparatively a new district, the first locations haviug heen made in 1890.

SUCCESSFUL ENGINEERING.—Phillipsburg *Call:* Friday morning the two crews working east from the Boca tunnel and west from the Bimetallic Extensiou shaft on the Bimetallic drain tunnel, came together aud shook hands. This completes the first division of the immense tunnel, a distauce of about 1200 feet, aud work east and west from the Parnell, and east from the Extension and west from the Granite is beiug pushed. The tunnel is the largest in the State. It will be 7000 feet in length when completed, which will be some four or five months yet.

STRIKE IN THE SPOTTED HORSE.—Another rich pocket has been encountered in the Spotted Horse at Maiden, if current rumor is to be relied on. The ore therefrom is said to run from $10,000 to $13,000 in gold per ton. So far, the extent of the hody is not known, though sufficient work has been done to demonstrate it is quite large. During the past ten days more than $150,000 has heen removed. But two men are at work taking out the ore, and the average is $15,000 per day to each man. This ore is not worked at the mills, hut is shipped to the Ompha smelter.

UTAH.

DELAYED WORK.—The railroad strike will greatly retard the rehuilding of the new mill and hoisting works at the Horn Silver mine. The timber on hand is ahout used up, and no certainty when more can be secured. There is also a car of machinery from Chicago en route, which is tied up somewhere.

The company has been delayed in securing lumher ever since the floods in Oregon, which shut off that supply, and having arranged for it from another source, the railroad strikes delay that.

The entire force of carpenters and the laborers will have to be laid off until the lumber is received. The force to be laid off will be ahout eighty men.

Salt Lake Herald: The late trouble at the Keystone mine in the Yellow Pine mining district over the thefts of ore ended in nearly all the men being discharged and replaced by new ones. The company at present is working about thirty men, and the mine to-day looks hetter than it ever did. The workings are down 400 feet and in the hottom the ore is of a higher grade for average than that of the upper workings. Tbe Keystone Mining Company has also two other valuable mining claims situated in Shadow mountain about thirty miles from Keystone and in California, across the line. Two men took out twenty tons of ore in a week's time, and teams have commenced to haul ore from here.

Upon tbe showing made by Professor Vincent, the English directors of the Flagstaff Mining Compauy recently ordered an increase in the capacity of the works at the mine of the company in Little Cottonwood canyon, and this work is now under way. Part of the new machinery is now upon the ground and the remainder will he delivered hy the time it is wanted. It was the original intention of the company to make an even greater increase in the works than that now under way and probably erect a mill, hut on account of the fluctuations and downward tendencies of hoth silver and lead, the more moderate policy was the one accepted. A good force of men has been at work without cessation and the idea is to increase the developments as soon as the new machinery is placed and the necessary repairs have been made. There is now on hand a considerable quantity of ore on the dump and shipments are to he resumed at once. The Flagstaff is one of the famous mines of the Territory and is owned entirely by foreign people, many of whom have never seen tbe property and know no more of it than they do of Central Africa, contenting themselves with the statements of their agents.

An important strike has been made in the Forlorn mountains, Ferguson district, situated southwest of El Dorado canyon on some old claims that were located some eight years ago and ahandoned. About the latter part of April John Heus, with another party, went to the old claims and got some ore from them which they had assayed for gold and which went very high. Other samples were then taken, all running from $10 to $600 in gold to the ton. There are four parallel ledges and all well defined, the belt is small, being about one mile wide and three miles loug. At present some ten locations are made. On the capital mine two shafts have been sunk, one twenty feet aud the other twenty-three feet and about seventy feet apart. The vein is two to two and a half feet wide and averages the same in both shafts, $41 in gold to the ton.

W. M. P. M. CO.—*Tribune:* The West Mountain Placer Mining Company has a force of men at work on its property in Bingham

canyon. The shaft is down 70 feet, where water is encountered, but the intention is to go to a depth of 150 feet to bedrock, and from there run drifts into the gold-bearing ground.

Mercur.

SUNSHINE AT THE SUNSHINE MILL.—The ore body is now blocked out on three levels, the lower of which is 160 feet from the surface. The ores are fully up to camp average, and little more can the plucky owners ask. At present developments are progressing with three shifts.

Park.

COMSTOCK RESUMES. The Comstock mine has resumed with a force of 20 men.

THE UINTAH DISTRICT. *Herald:* Miners returned from the new gold district in the Uintah mountains near the eastern line of the Indian reservation stated that the excitement was intense. Miners are flocking from every section of the country. Some finds have been made. The troops at Fort Du Chesne were called out to quell disturbances among the Indians. A small war was threatened.

MERCUR DISTRICT. The Marion mill made another cleanup the first of the week. After extracting the quicksilver the product was shipped East.

The Mercur Company are preparing to reduce their product to bullion before it leaves the mill.

The tanks are being placed in position at Geyser, and the operators will soon commence leaching that portion of the ore which can be worked without crushing.

The management of the Mercur report the last half of June run on the property the best that has ever been made by this bonanza. The amount of ore handled went ahead of all records. Bi-monthly dividend of $25,000 is due in August.

COPPER PLANT SHUT DOWN.—*Tribune:* The suspension of work on the copper plant is depriving labor at this time of about $35,000 a month, the pay roll for labor having reached that figure during the month of June.

In the absence of materials which are now tied up in the strike, the management says there was positively nothing for the men to do, and when day dawned yesterday morning it was upon a deserted plant, the pay roll at the property now consisting of a day and night watchman.

No one feels the blow more keenly than does the company itself, which is now in condition to produce 200 tons a day from its own mines. President Green, who is long past due here, is reported in Milwaukee, while Mr. Singer is tied up at some point on the railroads.

WYOMING.

GOLD AND COPPER FIND.—A rich discovery has been made in the Gold Creek country that is exceedingly rich in gold and copper. The paunings show it to be the richest find yet made in that section. C. H. Steel, the discoverer, claims it to be the richest ever found on the Sweetwater.

BALD MOUNTAIN ELECTION. The Bald Mountain Mining, Milling and Investment Company of St. Joe, Mo., at its annual in Sheridan, elected Paul Francke, president; G. M. Hahl, vice-president; M. F. Meyers, secretary; F. A. Moore, treasurer. It is the intention to put in two stamp mills at their Bald Mountain camp this season.

Bucyrus Steam Shovel on the Chicago Drainage Canal.

The construction of the great Chicago Drainage Canal is attracting the attention of the entire country, and much interest is being manifested in the machinery employed in the work. The steam shovels for excavating have been furnished largely by the Bucyrus Steam Shovel & Dredge Company of South Milwaukee, Wis., who have now fourteen shovels of their make on the work and are constructing five more for the same purpose, which will be ready within a few weeks.

This will make a total of nineteen Bucyrus steam shovels employed. The Bucyrus Company is just now a very busy concern. It recently secured orders from McArthur Brothers Co., contractors on the canal, for two other shovels, one of which will be the largest and most powerful machine of the kind ever built in this or any other country. Four steam shovels of the same magnitude and pattern have also been ordered from the company by Messrs. Griffiths & McDermott.

"In addition to these," state the company, "we have a number of other large orders on our books for dredges and steam shovels. We are increasing our force as rapidly as possible and working overtime. We have no reason to feel discontented with the times."

THE large placer mining plant on the Umpqua river, near Myrtle creek, Or., will soon commence operations with a 150-horse power boiler and pumping apparatus, which will force 24,000 gallons per minute through a 2½-inch nozzle.

Mechanical Progress.

Forging with a Hydraulic Press.

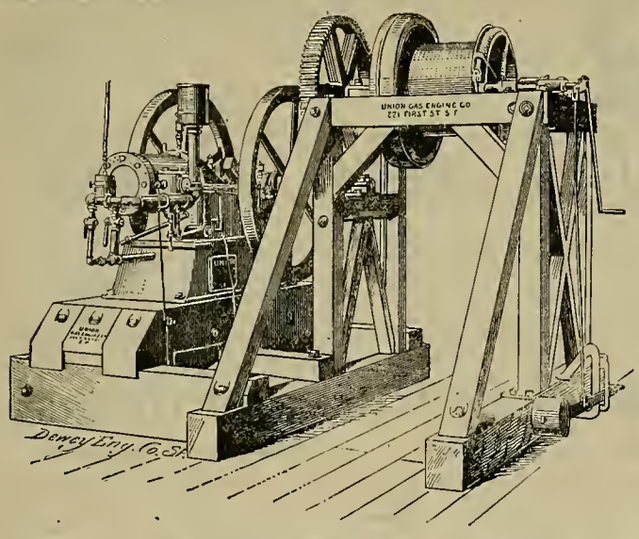
It now lacks just two years of being a century since Bramah first constructed a hydraulic press, working on the principle that if cylinders of different diameters be connected with a pipe the power exerted by a piston upon water in the smaller one would be multiplied in the action of the larger one in proportion to their areas. If the one had only a single inch of surface and the other 100 inches, then 250 pounds pressure in the first cylinder would produce in the other 25,000 pounds, or about 12 tons. But the stroke in the large cylinder, of course, would be only one one-hundredth as long as that in the pump. Such apparatus has long been used to squeeze cotton and hay for baling, to bend steel plates to a curve or a special pattern, to test the strength and tightness of boilers, to operate elevators and do much other heavy work. Sir Joseph Whitworth, the eminent British gun founder, introduced this system into his establishment some years ago for two purposes. He compressed fluid steel thereby, in order to render it more sound, and then he forged gun-tubes and steamship shafts in a hydraulic press, holding the soft metal on a stout mandril or cylindrical bar, slipped through a hole that had been bored in the ingot while the latter was cold. Much skill, however, is required in such forging in order to keep the white-hot steel from adhering to the mandril. Hydraulic power is also extensively used at present in making armor plate.

In a plant, described before the Iron and Steel Institute, the force-pump cylinder contains two plungers which approach each other simultaneously at each stroke. Escape through the connecting pipe and entrance to the press cylinder are effected without valves, although such appliances are required elsewhere. In this machine there is a pressure of three tons to a square inch. The piston which actuates the hammer or ram has a diameter of 30 inches, although the shank consumes part of its area; and the total force exerted when the ram descends toward the anvil is 1700 tons! More recent presses for this class of work have a capacity of 2000, 5000, 7000 and even 14,000 tons!

Utilizing Waste Steam.

During the past year the railways of the United States paid $7,000,000 to maintain the 10,000 water stations in this country. This expense, it is claimed, will be saved by the automatic tank now coming into use. This tank is actuated by steam from each locomotive as it stops for water—steam that would otherwise be wasted, as almost every locomotive while taking water blows off steam representing sufficient power to elevate a tenderful of water. There is nothing to do in operating the tank but for the fireman to turn on steam, which starts the flow of water into the tender, and to shut it off when the tender is filled. The next locomotive may be brought to the tank at once, a full supply of water being always ready.—Railway Age.

CARBORUNDUM, a substance approaching the diamond in hardness, and which has come into use in the arts to replace emery, is made by mixing together fine coke, sand and salt, packing the mixture round a carbon rod in an oblong box of fire brick, and connecting the ends of the carbon core with the terminals of a transformer, which raises the mass to a white heat. On breaking up the mass, the crystals of carborundum are obtained, bluish or yellowish-green in color, and varying in size from microscopic dimensions to several millimeters in diameter, and containing 30.49 per cent of silicon and 62.26 per cent of carbon.—Georgetown Courier.



Union Gas Engine Co.

Pioneer Manufacturers

Of Gasoline Engines and Owners of Twenty Patents on Same.

ENGINES FOR MINING PURPOSES A SPECIALTY.

WARNING!

If you are in need of power for mining purposes investigate this engine and take no other. Many so-called gasoline engines are now on the market, which are direct infringements of our patents and it is our intention to bring suit against the various infringers. As the law holds the purchaser, as well as the manufacturer, we would advise parties who have already purchased other gasoline engines to obtain from the sellers of such engines a good and sufficient bond protecting themselves in case damages are obtained against them, as it is not the policy of this company to work a hardship on innocent parties, but the law makes no such provision.

MINE BELL SIGNALS

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

Electrical Progress.

Car Lighting With Electricity.

Most trolley cars are lighted with electricity, the current therefor being supplied through the overhead wire from the power station. Although the trunk line railways, and especially the sleeping and drawing-room car companies, are ratber more given to providing such luxuries than the street-car companies, yet there have been difficulties in the way of supplying the necessary electricity. If storage batteries alone be resorted to, great weight and bulk would be required to furnish energy for a 24-hour or 36-hour trip, like that from New York to Chicago or St. Louis, or else frequent renewal of the cells aloug the way, which would consume time, would be necessary. It has therefore been deemed wiser to put a dynamo in the baggage car and generate the current in tbat manuer. However, as this is liable to get out of order, and as it may be necessary to stop it for other reasous, it would not do to counect the machine directly with the lamp circuit. Storage batteries would need to be interposed, so that there might be a greater or less accumulation of energy between the origiual source and point of consumption. These batteries, though, need not be very large.

One plan that has been tried in this connection is to use steam drawn from the locomotive boiler, which means an additional, though small, engine in the baggage car, and that is not altogetber satisfactory. Another very natural scbeme is to take power from an axle; in fact, to reverse tbe operatiou going on under a trolley car. There a current comes in from above aud drives a motor, which gears directly into the axle, compelling it to revolve when the electricity is turned on. But in steam-car lightiug the revolution of the car axle drives a dynamo by gearing iuto the armature of the latter, and this excites tbe current, whicb is then led up into the baggage car through suitable wires. This system bas already been tried on two private cars with good results. Still another plan whicb has been tried within the last few montbs puts tbe dynamo up above the car floor and brings power thereto from the axle by an ingenious belting, which adjusts itself to any twists and turns of the truck. American cars have a swivel between the coach frame and truck, but foreign cars are rigid at this point of juncture, and do not present the same difficulty in taking power from an axle. The whole matter of electric ligbting on trunk lines is yet in an experimental stage, but it may emerge tberefrom before mauy months.

Electric Signalling at Fires.

Precious time is often wasted in passing word along from the nozzle-holders to the engineer or captain of a steam fire engine, or to the man at the hydrant, when firemen are in service. This is particularly undesirable when an attempt is being made to throw a stream from the top of a ladder into a six or seven story window. In tbat case, somebody mnst clamber down to the street and then work bis way along several huudred feet, in order to ask for water or increased pressnre. Meantime the flames may be making tremendous headway. Au electric signal, invented to do this work instantaneously, was tried in Boston the other day in the presence of insurance experts at the Fire Department headqnarters. A pusb-bntton, like that commonly used with electric call bells, was inserted in the brass coupling next tbe nozzle, and a wire was introduced iuto each length of bose in sucb a way as to establish connection along the whole line. The bell was attached to the engine and was operated by a small "dry battery." Electric connection, of course, had to be made at each junction of two sections of hose, and this was accomplished merely by screwing the brass conplings together. Everything worked beautifully ou tbis occasion, altbough the witnesses were unable to tell whetber the apparatus could always be relied upon. It is customary to shut off water uow by a cock in the nozzle. But a system of signalling like that here described makes it possible to have the pressure removed more promptly, and thus save the strain on the hose.

Incandescent Electric Lights for Street Illumination.

Prof. W. A. Anthouy, formerly of Cornell Uuiversity, has been making forcible objection to some of tbe methods in vogue for the subdivision aud distribution of electric light or other artificial illuminatiou. He is decidedly in favor of the small unit or incandescent lamp as compared with tbe large unit or arc, whether we consider the illumiuation of a large space or ordinary street linear ligbting. Remembering tbat nine 16-candle power incandescent lamps can be run with the power required for one 405 Watt arc lamp, the arcs must be nine times as far apart as the incandescent consuming the same power, and to give the same illumination must be 81 times as intense, or about 1300-candle power. But in no arc lamp as used for street lighting do tbe rays proceed toward the more distant points to be illuminated reach more than a quarter of such intensity. Prof. Anthony expresses his opinion that tbe location of arc lamps at iutervals of 1000 to 1600 feet, as they are ofteu seeu in preteutious villages or suburban towns, is an entire waste of money. Incandescent lamps at intervals of 100 to 200 feet, run by the same power, would give a far better illumination. It is curious to note that frequent attempts bave been made at street lighting by iucandescents, but uniformly without great success; and that meanwhile it is a rapidly spreading practice to use the Edison mains, ordinarily employed for iuterior lighting, for the further service of arc lights on the streets. New York, Brooklyn, Boston and other cities have to-day thousands of arc lights burningin this way at low and perfectly safe potentials.

The Lamp of the Future.

Neither of the two forms of lamp now in common use for electric lighting yields all tbe results that could be desired. The arc concentrates the illumination too much; the incaudescent burner, while subdividing it, is wasteful of energy. It develops heat, and this is a net loss. Some of the most eminent of living electricians are trying to find a practicable and economical way of imitating the glowworm and firefly, by generating phosphorescent gleams devoid of warmth. Tbis was accomplished years ago with Geissler's tubes, in which an interrupted current was sent through wbat amounted almost to a vacnum. An attempt to iutroduce a lamp based on this principle into the market in London over a year ago created a brief sensatiou on both sides of tbe Atlantic; and much more promising experiments in the same direction have been made in this country and abroad by men of high reputation, but thus far the goal bas not beeu reached. The phosphorescent lamp at present requires currents of too high potential and frequency of alteratiou to be econmical.

A CONTRACT amounting to about $225,000 has been awarded an electric company for the complete eqnipment of the Metropolitan elevated road of Chicago, witb power plant, geuerators and motor cars. It is said that figures show a saving of about $200,000 a year in the operation of the road by electricity as compared with steam locomotives.

THE *Electrical Review* uow says: "Economy seems still to be the order of the day. We know one central station man who says be has bought no supplies for three months, and will probably buy none for three months to come."

Practical Information.

Lights in the Ocean's Waters.

The suulight only penetrates a short distance below the surface of the ocean, and were it not for a wonderful provision of nature the depths of the sea would be as dark as Erebus. The deep-sea animals and many that live near the surface are furnished with light-giving organs. One of the most familiar of the phosphorescent animals is the noctiluca. If the hand be drawn through the water of the tropics at night and a watch be held within a few inches of it enough light will be emitted to see the face clearly. In the Pacific one can see numerous luminous fishes darting about the surface.

Nearly every group of animals may be said to contribute lights to the ocean depths. Upon a dark night the voyager can see near the surface numerous jelly fishes, almost invisible during the daytime, but gleaming theu with a mysterious light that is heatless and cannot be explained. Farther down can be seen great disks of jelly shining with a faint yellow light, like moons; others with long tails, like comets. At the bottom of the deep sea, where the temperature is almost freezing, nearly every animal is a light-bearer. The fishes are the most remarkable. The pressure is here so great that glass is powdered, and wood crushed out of all semblauce to itself. The auimals withstand the great pressure because their bones are cellular and porous, like great sponges. The echiostoma, a fish found in water 13,000 feet deep, is provided with lumiuous spots arranged about the eyes, which undoubtedly supply sufficient light for all its purposes. The steuptyx is luminous over its entire surface. The stomias, a ferocious, snake-like creature armed with fang-like teeth is furnished with rows of light which surround it like an aureola. The malacosteus has lights on its head, one emitting a golden and the other a greenish tint. A species of shark gives out a greenish light.

The floor of the ocean is carpeted with luminous forms. The starfishes that are lifted by the dredgers are often lumiuous over the entire surface. The most remarkable light-giver of the deep sea is the umbellularia. They form a forest on the ocean bottom that would appear, if we could get them to see, like a waving cornfield with every leaf flashing with light. This animal is found several miles below the surface. Ascending near the surface we find in the southern seas the pyrosoma, which is hollow aud columnar in form. Vessels sailing through schools of these animals seem to be plowing through liquid fire.

The Paper Lamp Shade.

According to a writer in the *Times*, paper colored with chromate of lead may be subject to spontaneous combustion, and this had, he says, taken place with a paper lamp shade. For two days prior to the accident the lamp, a duplex, had not been lighted, and there had beeu no fire in the room. Since the morning of that day, when the room was dusted and the shade apparently in its usual condition, no one had entered the room. The shade was made about a year ago from so-called crinkled tissue paper, one white and one yellow sheet, gathered together at the upper part where it was fixed to the wire frame, where it formed a considerable bunch, and spreading thence to the frame below. On examinatiou the yellow paper was found to be colored by chromate of lead, and this, uo doubt, was the cause of the accident. There cau, he thinks, be no doubt that this was a genuine case of spontaneous ignitiou, though he has not as yet been able experimentally to reproduce the necessary conditions leading to such a rest. The dangerous paper is readily recognized by setting fire to a piece of it and blowing out the flame. In the case of ordinary paper it will be fouud that the glow along the burnt edge is very soon extinguished, whereas in the case of these chromate papers it continues until the whole is consumed, as is the case with ordinary touch paper. He fiuds that, besides the yellow paper, pale green paper also contaius chromate of lead, and would no doubt be equally dangerous, and possibly there are other colors containing the same material.

Solar Suction.

At a recent meeting of the Engineers' Club of Philadelphia Joseph T. Richards made some interesting remarks on the actual work of lifting performed by the sun's rays in the absorption of water through the atmosphere. He said: "For many years past I have been much interested in matters relatiug to the composition of the atmosphere and the work done by the sun in raising the moisture afterward precipitated as rain. Professor Loomis claims that the average height of clouds is two miles. Although this is probably correct, I think there is no doubt on the other hand that many clouds from which we see rain falling are within half a mile of the surface of the earth. To make a moderate calculation, let us assume as a minimum distauce 3000 feet. If you figure it out, you will find that a rainfall of one inch an hour would amount to 72,600 tons of water deposited on each square mile, to elevate which 3000 feet would mean an amount of work equal to 220,000-horse power. To raise this water in an hour by pumpiug eugines giving a duty of 100,000,000 cubic foot pounds would require the consumption of 200 gross tons of coal. I think this will help us to appreciate the immense amouut of work being done by the suu in storing up our natural water supply. If the average elevation of Philadelphia is 84 feet, then we have 4517-horse power developed for each square mile for a rainfall runoff in an hour. When those quautities are considered the wouder is that when we have such downpours as that which caused the Johnstown flood the damage is not much greater than it was on that occasion."

LIKE all other metals, except iron and platinum, aluminum combines with mercury, forming an amalgam. The properties of this amalgam are quite remarkable. While aluminum itself is practically not oxidizable, the amalgam is energetically attacked by air and water. Even the slightest combination of mercury with the metal is sufficient to produce this result. The amalgam rapidly decomposes water, liberating the hydrogen and developing a measurable degree of heat.

Market Reports.

The Markets.

SAN FRANCISCO, July 26, 1894.

The London price for silver on the 25th was almost 28 15-16—the highest for the month. There is little change to note in that or other metals. Despite the low price of copper, some mines producing that metal are able to declare dividends. The Quincy Co., of Michigan, has declared a $4 dividend on each of its 50,000 shares, payable next Wednesday. That is the second $200,000 dividend this year, and makes a total of $7,070,000 in dividends paid by that mine.

New York Prices.

NEW YORK, July 26.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.
Thursday	28¼	62¼	....	....	....
Friday	28⅝	62⅝	9 00	3 10	19 40
Saturday	28⅝	63⅝	9 20	3 12½	....
Monday	28⅝	62⅝	....	....	....
Tuesday	28½	62½	9 20	3 10	19 25
Wednesday	28⅞	62⅝	....	....	....

An item has been appearing in nearly every mining paper, copied from the Glenwood, Col., *Echo*, saying "a carload of silver ore was shipped by the Smuggler mine that was worth just $400,000." A few figures will show that even the famous Eberhardt ore from White Pine couldn't stack up enough to make near that amount. A carload of twenty tons of pure silver would he at an outside figure 583,000 ounces Troy, which at current rates would be worth $360,000. If the carload went 50 per cent pure silver it would he worth $180,000, which would he uncommonly rich. By the time such stories get over to England it is made to appear there that the silver miners of the West hlast solid silver out in ton chunks, thus thwarting all righteous effort toward remonetization.

THERE is a prospect for quite a mining boom at Meadow Lake this fall. Many locations have been made by the people of Sierraville recently, says the *Leader*. Two firms, one in Denver and one in San Francisco, have bonded mines there, and both have discovered processes whereby the rebellious ores of that locality can be worked.

Mining Share Market.

SAN FRANCISCO, July 26, '94.

There was a noticeable improvement in the market this week. Con. Cal. and Va. figure a profit on Juue workings of $50,000, though that has very little to do with the quotations of its stock. The Bodie Consolidated is out of debt and has $32,000 in coin and 10,500 shares of capital stock in its treasury. The California is out with a hullion report for June showing that during that month the Morgan mill crushed 1916 tons, which yielded $108,079, of which $37,047 was gold. The yield was 92 per cent of the hattery assays. The Standard Consolidated of Bodie paid a $10,000 dividend yesterday.

The following illustrates the changes of the week:

Dividends for June.

In the issue of the 7th inst. was given a list of mining dividends paid in June so far as it was possible to procure them, mail communication making it manifestly impossible to give a list even approximately correct. Newspapers from the interior of the State now arriving enable us to reproduce the list with closer approach to correctness.

The following mining companies declared dividends in Juue:

MINING COMPANIES' JUNE, '94, DIVIDENDS.

	JUNE.	Total for year '94.
Alaska-Treadwell, Alaska	$150,000	$300,000
American, Montana	....	21,658
Aspen M. & S. Co., Colorado	30,000	30,000

Union, Colorado	6,000	12,250
Union M. Co., California	2,500	2,500
Victor, Colorado	15,000	45,000
W. Y. O. D., California	3,000	18,000
Zion M. Co., Nevada	10,000	10,000
Totals	$ 873,063	$4,033,034

Twenty-five mines paid dividends in May, amounting to $885,100.

It will he noted that in June twenty-eight mines paid dividends, as against twenty-five in May: that the June dividends aggregated $879,063, and that during the first half of '94 those mines paid in dividends the comfortable sum of $4,033,034,

San Francisco Stock Board Sales.

Coast Industrial Notes.

—Adolph Sutro is goiug to build an electric road from Clement avenue in this city to the heach.

—Puget Sound lumher "is being sent to the South African colonies for use in the gold mines.

—It is reported that the California Jute Mills at Oakland, employing 400 people, will close down this week.

—Sixteen coal-laden vessels are uow on the way here from Australia, with twenty-six more entered to follow.

—The Forhes Wheel Company has incorporated. Capital stock, $300,000, of which $180,000 have heen subscribed.

—Columbia river canners estimate the salmon pack there will fall short by more than 100,000 cases, due to floods.

—The *Northwestern Lumberman* says the general distrihutive lumber trade is greater in volume than this time last year.

—During June, San Francisco exported 472 M ft. lumher, chiefly to Central America and Mexico. The exports for June, '93, were 1079 M ft.

—With a capital stock of $1,600,000. the Alcatraz Asphalt Company has incorporated, to deal in oils, asphalts, gas, water and mineral deposits.

—The Sau Francisco Coffee Company has filed articles of incorporation with a capital stock of $450,000, $275,000 of which is subscribed.

—A contract has heen let and work hegun on the new water works at Paso Rohles, Cal.; $12,000 will he expended in constructing a new reservoir.

—The Standard mill at Snohomish, Wash., employiug 100 hands. has been totally destroyed by fire, causing a loss of $60,000. The iusurance is $4000.

—The North Pacific Mining and Transportation Co. has incorporated in this city with $3,000,000 capital stock, of which $75,000 has beeu subscribed.

—From Jau. 1st to June 30th the total shipments of lumher hy cargo from Tacoma amounted to 19,984,719 feet—a decrease from the amount shipped in the first half of 1893, which was 37,476,436 feet.

—The San Fraucisco Board of Education has let a contract for the first trades school to he erected in this city hy the department. The building will he three stories in height, constructed entirely of hrick, and will occupy the vacant lot on the southeast corner of Bush and Stockton streets.

—In the United States Circuit Court judgment has heen given against A. W. Von Schmidt. who has been suing Bowers' patent hydraulic dredgers. It has been tedious litigation, and it is thought when the amount of assessed damages is made up it will aggregate $500,000. Bowers' career is an illustration of the fact that "keeping everlastingly at it hrings success."

—On shipping in '93 San Francisco levied $85,675 taxes, a sum within $600 of the comhined taxes paid by the Cunard Line, the Hamhurg-American Line, the North German Lloyd and the Compagnie Generale Traas-Atlantique to their respective governments, their comhined shipping comprising upward of 700,000 tons of the hest steel and iron steamships iu the world, valued at upwards of $58,000,000.

—P. Costello has the contract for the construction of the Middle Kittitas, Wash., irrigation canal. His hond is in the sum of $273,495. His hid in detail was: Solid rock excavation, $1 per yard; loose rock, 32 cts. per yard; earth, 10 4-10 cts. per yard; lumher, t. aud g., $17.40 per M.; lumber, rough, $16.40; earth excavation, tunuel, $1.54 per yard; loose rock, $3.74 per yard; solid rock, $6 per yard; lumher lining tunnel. $18.40 per M.; clearing, $22 per acre; gruhhing, $80 per acre; iron, bolts, etc., 4½ to 6 cts. per pound; concrete, $9 per yard.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Phillip Hayes in the Hayes & Steelman Mine near Gold Lake, Sierra Co., to deposit tailings on a flat in Mohawk Valley; from Stephen Soracco in the Mohawk Mine near Johnsville, Plumas Co., to deposit tailings behind log and brush dam in a ravine; from Frank F. Vanzini in the William Tell Mine near Johnsville, Plumas Co., to deposit tailings behind log and brush dam in Yankee Ravine; from Nicola Rossi and Peter Lorenzo in the Grizzly Bear and Garfield Flat Mines near Johnsville, Plumas Co., to deposit tailings behind dams in Squirrel Creek; from Reagan and Lowe in the Howard Mine near Ono. Shasta Co., to deposit tailings behind brush dams in a ravine; from T. H. Steel in the Steel & Co's Mine near Brownsville, Yuba Co., to deposit tailings behind stone dam on New York Flat; and from the Consolidated Amador Volcano Hydraulic Gold Mining and Land Co. of California in the China Hill and Elephant claims, to deposit tailings in Sutter Creek; gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., on Monday, August 13th, 1894, at 1:30 P. M.

Professional Cards.

WM. GILBERT, B. S., Manager.
PRACTICAL ENGINEERING SCHOOL,
205 Goodenough Building, Portland, Or.
Civil, Electrical, Steam, Mining, Assaying.
Full charge of plant taught. Circular.

F. ORTON, Mechanical Engineer.
EXPERT DESIGNER of Special and General Machinery.
PREPARING PLANS of Steam, Air and Hydraulic Apparatus; Iron and Wood-Cutting Machines; Transmission of Power, Etc.
218 Mission St., San Francisco.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying.
728 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

Nevada Metallurgical Works,
No. 23 Stevenson Street.
Near First and Market Sts., San Francisco.
C. A. LUCKHARDT, Manager.
Established 1869.
ORES WORKED BY ANY PROCESS.
Ores Sampled.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.
C. A. Luckhardt & Co.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

Everette's Mining Office.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
Dr. Willis E. Everette,
1318 E Street,
Tacoma, State of Washington, U. S. A.

Almarin B. Paul, M. E.,
Mining Operator,
ROOM 5, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
OFFICE OF
California and Nevada G. & S. Extraction Co.
Shasta Gold Extraction Company.
Comstock G. & S. Recovering Co.
Agency for the CYANIDE PROCESS
For the Counties of Shasta, Trinity, Siskiyou, Inyo and Mono, California; Esmeralda, Storey, Lyon and Douglass, Nevada.
Plans and Estimates made for IMPROVED CYANIDE PROCESS PLANTS for Gold and Silver Extraction, and competent instruction for successfully working the same on a large, practical scale.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 10, 1894.

522,585.—NUT LOCK—J. C. Brown, Santa Barbara, Cal.
522,822.—FOOD PRODUCTS—J. W. H. Campbell, S. F.

522,854.—TAPPING MACHINE — M. Crawford, Jr., Stockton, Cal.
522,785.—FRUIT JAR—F. A. Dixon, San Jose, Cal.
522,787.—BOAT'S DAVIT — Ench, Fugel, Cooke & Schultze, Oakland, Cal.
522,593.—BLIND SLAT HOLDER — E. E. Hansou, Spokane, Wash.
522,841.—ELECTRIC BELT—W. E. Y Lawlor, Portland, Or.
522,965.—MAGAZINE GUN—A. Lee, New Whatcom, Wash.
522,980.—DOUGH KNEADER—I. Lobree, S. F.
522,993.—BOTTLE ELEVATOR—F. McLaughlin, Oroville, Cal.
522,704.—TRUSS—Robt. Nagler, S. F.
522,916.—HINGE—Noble & Buxton, Forest Grove, Or.
522,765.—HAIR CLIPPER—O. Olsen, S. F.
522,765.—WASHING MACHINE — C. A. Palmquist, Spokane, Wash.
522,767.—ROTARY DRIER—H. Rich, Corralitos, Cal.
522,768.—BUTTONHOLE PATCH—E. P. Roche, S. F.
522,916.—PIPE—J. & D. J. Shultis, Los Angeles, Cal.
522,827.—FRUIT PITTER—F. C. Stanford, Gilroy, Cal.
522,807.—AMALGAMATOR—G. W. Strong, S. F.
23,453.—DESIGN FOR PARLOR ARCH—W. A. Kemp, S. F.

FOR WEEK ENDING JULY 17, 1894.

523,055.—FRUIT CAR—D. E. Bartou, Los Angeles, Cal.
523,271.—CONDUIT RAILWAY — J. W. Eisenhuth, S. F.
523,319.—TROLLEY CONDUCTOR—J. W. Eisenhuth, S. F.
523,141.—PORTABLE BOOTH—J. W. Ernest, Los Angeles, Cal.
523,273.—GRIP BLOCK — G. S. Fouts, Aberdeen, Wash.
523,238.—JOINT AND BEARING—W. C. Rarig, S. F.
523,130.—EJECTOR FOR GUNS—G. A. Sachs, Eugene, Or.
523,111.—LARDER—J. Schade, Los Angeles, Cal.
523,185.—MACHINE GUN — P. B. Tyler, Spokane, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the pateats recently obtained tbrough Dewey & Co.'s SCIENTIFIC PRESS U. S. aud Foreign Patent Agency, the following are worthy of special mention:

FRUIT JAR.—No. 522,785. July 10, 1894. Frank A. Dixon, San Jose, Cal. This invention relates to improvements in hermetically sealed glass jars adapted to contain fruit and similar snbstances. It consists of a jar having a thickened rim projecting outwardly with a ground surface adapted to receive a gasket, an annular ring or flange aronnd the neck with grooved depressions on opposite sides, a cover fitting upon the gasket with a rim projecting below the top so as to form an annular channel for the reception of the sealing wax or material, when the jar has been inverted, and an elastic semi-circnlar ring adapted to snrround the neck of the jar below the annnlar flange, having arms projecting upwardly through the depressions in the flange and adapted to bend inwardly over the cover of the jar, the whole forming an improved seal and means for locking the cover in place.

BUTTON-HOLE REPAIR PATCH.—No. 522,768. July 10, 1894. Edward P. Roche, San Francisco, Cal. The object of this invention is to provide a readily removahle and transferahle repair patch which is easily applied whenever a button-hole breaks out unexpectedly, so that the article may be temporarily placed in a condition to be worn without makiug a permanent repair at tbe time. It consists of a strip of non-corrosive material, folded upon itself, so that its bight or folded edge fits over the edge of the garment, and its folded memhers clasp both sides of the portion of the garment through which the broken hutton-hole is made. These memhers have openings made in them near the center adapted to coincide with each other and with the button-hole of the garment so as to serve as a temporary buttonhole, and the device is provided with readily detachahle fastenings by which the free ends of the patch are secured to the garment at some point beyond the broken hutton-hole.

HAIR CLIPPER.—No. 522,765. July 10, 1894. Ole Olsen, assignor to the United States Hair Clipper Manufacturing Co., San Francisco. The object of this invention is to provide a hair-clipping machine having a hinge connection between the cutter head and the handles and a mechanism by which the cutter may he actnated from the handles in whatever position it may stand with relation thereto. It consists of two handles pivoted together, adapted to approach and separate from each other, a stationary toothed comh plate hinged to and turnable about the extension of one of the handles and a connection between the other handle and the movahle cutter plate wherehy the latter is reciprocated across the comb plate hy the opening and closing of the handles, while the comh and cutter plate are allowed to turn to any desired position with relation to the handles. The handles are closed together hy compression and are separated by the action of a spring suitahly fixed with relation to the hinge thereof.

ROTARY DRIER.—No. 522,767. July 10, 1894. Harrison Rich, Corralitos, Cal. This invention relates to that class of driers in which the material to he dried is carried upon supports which are suspended freely from the periphery of the horizontally rotating reel which is mounted within a hot-air casing. The invention consists in a means for suspendiug and coatrolling the carriers so that each may be readily swung outwardly beyond the periphery of the reel where they can be loaded and unloaded, or they may be swung inwardly and locked when in normal operation. It also consists in the normal construction of the casing hy which the carriers are readily manipulated, and the reel is made in a plurality of independent sections mounted upon a common shaft and adapted, by suitable clutches, to he engaged with and disengaged from the shaft so that any one of the sections may he arrested and discharged and reloaded without stopping the operation of the others.

FOOD PRODUCT AND APPARATUS.—No. 522,822. July 10, 1892. James W. H. Campbell, San Francisco, Cal. This iuvention relates to improvements in food products, and consists of a process for preparing the grain, and in devices constituting apparatus for carrying out the same. This consists of an elevator and a series of hoppers into which the various grains are delivered, raised by the elevator and discharged so as to fall from a considerable height through the atmosphere into a receiving bin or hopper, where the shock of the fall serves to destroy any germ life which may be found in the grain, and the grains, heiug thus first treated separately, are mixed and again treated in the same manner aud ground for use. This treatment seems also to add a certain amount of phospboric acid to that naturally contaiued within the grain, which is cousidered valuahle for food products.

AMALGAMATOR AND SETTLER.—No. 522,807. July 10, 1894. Geo. W. Strong, San Francisco, Cal. The object of tbis invention is to combine in a single apparatus means for first grinding and amalgamating the ore pulp, and means for afterwards separating and settling the valuable precious metals from the lighter worthless material in the pulp without removing the latter from the pan in which the grinding has heen done, and also in a means for securing the safety of any valuahle material which may he left unguarded within the pan. The pan may he of any usual or snitable form, having a muller or carrier, with mechanism by which it is rotated in the pan, shoes and dies within which the ore-bearing material is ground in the first part of the process, and means for raising the miller and shoes above the surface of the dies so that it will rotate ont of contact therewith for the purpose of settling and separating the lighter and heavier valuahle particles after the grinding has heen completed, the metal being also amalgamated within the same pan without any danger of the amalgam heing floured hy grinding. Mechanism is also employed hy which different rates of speed may he used for the grinding and settling and a device whereby the discharge openings are securely locked so that no material can he surreptitiously taken from the pan.

AUTOMATIC BOAT DAVIT.—No. 522,787. July 10, 1894. Frank Ench, Hugo Fugel and John L. Cook of Oakland, Cal., and Gustav Schultze of Berkeley, Cal. Said Cook assignor of one-half his right to John Dolheer of San Francisco. This invention relates to that class of boat or ships' davits in which the boat is suspended from arms or sections of the davits hinged or jointed and adapted to swing in order to carry the hoat inhoard or outhoard, the object of the invention heing to enahle an effective and rapid operation of lowering the hoat or again swinging it in place. It consists of davits having a lower fixed section, an upper swinging section jointed thereto at a point intermediate of the overlapping ends of the two sections and limiting stops formed hy an extension of each section, together with blocks of the upper sections, and hoisting lines or falls hy which the hoat is suspended from said blocks and guided downwardly, so that through the raising and lowering of the boat the upper sections are swung in and out automatically. With these is used a winding shaft, with drums to which the lines or falls are attacbed, and a retaining pawl or rachet for holding the shaft, together with a brake which is applied to the winding shaft to control the descent of the hoat when it is being lowered.

New South Wales Tin Production.

The New South Wales Department of Mines estimates the quantity of tin raised and exported from that Australian district during the 21 years ending December 30, 1892, in round figures at 121,912 tons. This total includes tin in the shape of ore and of ingots. Its production is becoming one of the settled industries of the country, the quantity raised depending entirely upon the prices realized. The manufacture of tin plates, however, is not yet on the list of New South Wales industries. All manufactured tin is imported and is extensively used for canning purposes. The quantity of tin plate imported duriug 1892 amounted to 62,078 packages, also 19,033 packages of tinware.

WHAT are believed to be indestructible flywheels are now being made, at the suggestion of F. P. Sheldon of Providence, from wrought-iron plates bolted together. A wheel of this sort has, instead of spokes or arms, a continuous web or disc, composed of two sets of six sections each, made to overlap and break joints, and bolted to each other and to the rim. The latter is also made in segmeuts.

THE Rosebud mill, at Cripple Creek, Col., owned by a French company, was burned last Monday. The loss is $150,000, partly insured in this city.

A LARGE, VALUABLE
Gold Mining Property
FOR SALE CHEAP.

A GRAND OPPORTUNITY NOT EASILY DUPLICATED. Actual value many times the price asked.

Situated in Nevada County, California, and consists of a group of four mines, all strong, heavy veins. Only partially developed. Ore free milling. Over $90,000 past yield of ore from one mine alone.

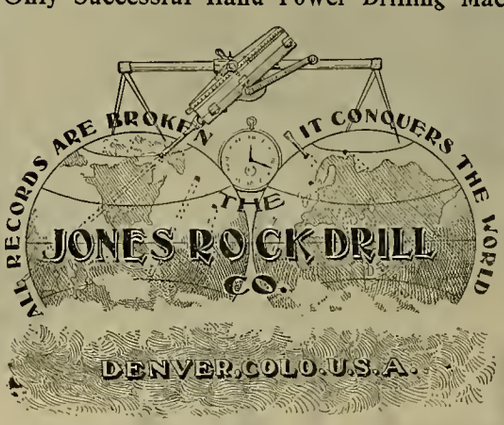
Must be sold within 30 days to close out an estate. Price, $30,000. Terms, $5000 cash; balance easy installments, or 20 per cent of gross proceeds, to suit purchaser.

Machinery on the ground worth cash payment asked. For prospectus and particulars, please address:

S. B. FOWLER,
Grass Valley.... ....California.

Wanted, Good Mining Properties.
Owners wishing to sell should communicate direct with J. GRIFFIN, room 30, fifth floor, Mills Building, San Francisco. Principals only dealt with.

THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.



It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

DOUBLE-ACTING
Cornish ★ Plunger.

PUMPS TWICE AS MUCH WATER AS THE OLD PLUNGER. Only about one-third the weight of the old Plunger. Special construction of steel for packing on mules, only one-twelfth the weight of the ordinary Plunger. First outlay one-third less; works with 10 per cent less power.
IMPROVED SINKING PUMP.—Bucket and clack changed under water. Bucket lasts six times as long as the old one, saving expense of putting down another pump where bucket and clack cannot be changed under water. The self-tightening and self-lubricating stuffing box and new bucket also saves expense of dropping extra pumps. **WM. NANCE, Grass Valley, Nevada County, California.**

THE JOHNSTON CONCENTRATOR.

THE HUDSON GOLD MINING CO., WARD, COLORADO, June 8, 1894.

RISDON IRON WORKS, San Francisco—GENTLEMEN:—After a thorough test of the Johnston Concentrator, I am so well satisfied that I wired you to ship me two more as speedily as possible. I find the machine well constructed, easily kept in order, requiring but little attention, and doing entirely satisfactory work on our ore. After my experience with other tables, I am congratulating myself on my possession of the Johnston. Yours faithfully,

B. LANGRIDGE, Ph. D., Mining Engineer.

VOLUME LXIX. Number 5. SAN FRANCISCO, SATURDAY, AUGUST 4, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Colorado Gold Mine.

When Colorado's Senators declared that desolation would sweep the Centennial State if the Sherman bill were repealed, while fully justified in strenuously opposing such adverse legislation, it is evident that the results were exaggerated, for if the usually accurate statements of our Colorado exchanges are to be credited, that State is entering upon an unparalleled prosperity by the development of the gold properties of the commonwealth. In three counties alone, it is asserted $12,000,000 will be the yield of '94, and the mining papers claim that the gold yield of the State for '95 will crowd that of California pretty close, in point of magnitude. While this is not at all likely, yet in the matter of gold yield, the only competition is one of friendly comparison: the ordinary element of business competition cannot enter into the question, for, unlike other forms of enterprise, gold is always sought by the buyer; there is no overproduction in the world's marts; the producer has to find no market; his customers find him; no matter how much he has he can readily dispose of it, and the more he has the better pleased everybody is. As a matter of interest to local readers, the method and manner of a Colorado gold mine are here given extended illustrated mention, we being indebted to that excellent journal, *The Colliery Engineer*, of Scranton, Pa., for the text and the accompanying cuts.

The mine selected for showing our sister State's gold resources, how men mine for gold elsewhere, and much pertaining to a gold mine as developed in Colorado is the Standley Consolidated mine, at Idaho Springs, Clear Creek county. The original article is by Prof. Arthur Lakes, of Golden, Col.

The mine is located on both banks of Clear creek, about a mile above the mining town of Idaho Springs about 40 miles from Denver by the Union Pacific railway, which runs up the canyon and through the property on the north side of the creek. Its altitude is about 7600 feet.

The geological formation is Archæan gneiss and schist, traversed by many large masses of a coarse crystalline granite, forming large irregular segregative veins of pegmatite, coarse sparry crystalline, granite of feldspar and quartz, with very little mica. These veins are irregular in shape and character. Sometimes they are only a few inches wide and long; at others 50 feet wide, and cleaving the mountain sides from top to bottom, easily distinguished from the country rock by their light pink color, and from their hardness standing out in relief above the surrounding rock like great red dykes. The course of the main system of such veins is northeast by southwest, another less powerful set cutting them diagonally.

The original owners thought that their claims covered the whole of the vein on both sides of the creek from mountain top to mountain top. But the present owner discovered by examining the maps, that a large part of the vein near the top of the mountain on the south side, owing to a mistake in observing the direction of dip in the vein, was not included in their location, so he located on the Aspen above them and opened upon the top of the mountain the Standley mining shaft. This is a double lesson (in Colorado): first, to be careful in locating claims; second, that good prospects and extensions in quite an old, long settled camp may yet be found by those who look for them.

After working the Standley for some time, the owner, by surveys and measurements, began to suspect that some of the workings of the Whale mine, adjacent, were trespassing on the side lines of his property. He opened a shaft on the vein at the extreme limit of his side line, down the hill, and broke into the middle of the Whale's tunnel. A compromise resulted in the present owner buying out the old mines and uniting the Whale, Hnkill and Standley in one property.

The first development of the vein was not promising. The surface of the lode showed little value, and not till many thousands had been expended did it be-

THE stock shares in the South Africau gold mines are passing from British to Freuch aud German holders. The Transvaal companies issne their shares "to bearer."

WHEN the capacity of the plant at the Mereur mine, Utah, is increased to 250 tons per day, which work is now in progress, it will be the largest works using the cyanide process in this country.

JUDGING from some of our exchanges therc seems to be an impression iu Montana that the suspension of required assessment work is for threc years. The bill as passed appears elsewhere and is explicit.

TEN DOLLARS is the present price of a ticket from New York to Liverpool. Thousands are flocking back to Europe from this country, many of whom came without welcome and leave without regret.

SINCE the first of January 33 new gold mining companies have been organized under the laws of this State. Is there any other industry in this or auy other Statc that exhibits morc present activity?

IN the vicinity of Los Augeles sixty-nine oil wells are producing 360 barrels per day, selling at $1.40 per barrel, crudc state, for fuel for cablc and electric railway. Twenty-one more wells arc about to be suuk.

CAMPBELL BERRY, the new assistant U. S. Treasurer, has takeu charge of the Sub-Treasury in this city. There was in the vaults on the 1st, $37,071,804.78; of this 39,600 pouuds are iu gold aud 1,392,000 pounds silver.

BY the first of next month Pekin, Cbina, will have a direct wire from St. Petersburg, Russia, aud be telegraphically joined to the rest of the world. About 100 miles between Osh and Kashgar, Turkestan, now building, is thc sole gap between the telegraphic girdle round the globe.

IT IS REPORTED that on Friday last a cloudburst occurred on the headwaters of Light creek, causing a very large flow of water. The waters of Indian creek, as a consequence, were very heavily charged with debris.—*Plumas National-Bulletin.*

The Anti-Debris Association should at ouce obtain a temporary iujunctiou against eloudbursts. It might attract renewed attention for thc association to institute a quarrel with thc Almighty.

'TIS over thirty-two years siuce naval warfare was revolutionized by the fight betweeu tbc Monitor and thc Merrimac. The most importaut uaval conflict since then in point of probable results with modern vessels was fought last Monday off the Corean coast between the Chinese and Japanesc fleets. It was not thought such practical test of floating ordnance would be made by Asiatics, but it happened so. The destruction is tremeudous, tbe Chinese losing four large vessels, one of 7400 tons, armed with Krupp guns.

THE prominence that electrical affairs are assuming is illustrated by the appearance of wbat may be styled "electricity lawyers." This is the age of specialties. We have corporation lawyers, real estate lawyers, crimiual practice lawyers, and now comes a class who devote themselves exclusively to "electrical cases."

BRITISH COLUMBIA is making a stroug effort in tbe Canadian parliament to get the duty off mining machinery, or at least to have a more liberal administration of the present law. It is believed that the effort if successful will be for the best interests of that proviuce. Mining machinery is needed to develop British Columbia's mines, aud to shut out American machiuery is to shut off the most efficient form of development. American machinery for successfully treating gold, silver and lead ore, is thc only kind of any use in British Columbia. This is the strongest argument that British Columbia's representatives can make, being practically unanswerable.

OLD Pacific coasters will remember the project in 1865 and 1867 to build a telegraph line tbrough British Columbia and Alaska, crossing to Siberia. The line was built almost to the Alaska boundary. Recollections of it are revived by the presenl propositiou of buildiug a line of railway up to and aeross Bering strait. Those who, visionary or otherwise, favor the enterprise say that at tbe point to be crossed between Asia and America, the strait is but thirty-six miles wide, broken nearly midway by the Dromeda islands, and that a depth of not more than forty feet, with a solid rock bottom can be relied on; it is further claimed that the Arctic current, passing northward, forever keeps thc channel free from ice. Still, it will probably be a long timc till some future Debs orders a strike on thc Alaska & Siberia Transcoutinental railway.

HENRY CLEWS, who weekly issues a letter that from his point of view is full of meat, suggests to Secretary Carlisle that duties be made payable in gold. He says that would stop the drain on the treasury gold reserve. Whatever else it would or wouldn't do, such a move would send gold above par. It is not altogetber improbable that gold will soon be quoted at a premium anyhow. But since '78 silver dollars are payable for all duties, public or private. Should Congress take away that functiou, gold would bound up to 1.20 or 1.25 before thirty days. That provision is the last thing in the way of such consummation so devoutly wished by Mr. Clews et. al. The matter is not wholly in Secretary Carlisle's hands, and even the present Congress would hesitate to adopt so drastic a method. The easiest and best present way to check the gold draiu was pointed out in this column three weeks ago—to hold the legal tenders as tbey are presented and redeemed, coustituting them a part of the reserve till they are called for iu exchange for gold, theu to be reissued.

Mine Timbering.

Mr. J. J. Crawford, the State Mineralogist, has issued from the State Mining Bureau Bulletin No. 2, "Methods of Mine Timbering," compiled by W. H. Storms, which is of great practical value. Tbe systems of timbering used and adaptable in quartz and drift mining on this coast are giveu thorough consideration, tbe treatise being the result of visits to mines where tbe details were observed and berein given clearly and practically. The pamphlet is embellished by uumerous engravings, adding materially to its value, and will be sent to any one wishing it who will send his address to the State Mining Bureau. Tbe issuance of sucb publicatious as tbe oue here briefly noticed illustrates one of the many direct benefits of tbe Mining Bureau. It is notbing more than the statement of a fact to say that in no department of auy California public institution is there more direct and manifest benefit derived by the State for the money expended tban in the operations of the State Mining Bureau.

Care of Mine Cables.

The care giveu the mine cable is an important feature in mine management. Upon the coudition of a cable depends largely the safety of the men employed. This is thoroughly understood by nearly every mining superintendent and foremau, and every mine that aims to keep up to the requisite standard of safety in this importaut regard has a mau whose daily duty it is to thoroughly look the cable over, keep it lubricated, etc., and report on its condition. Wben an accideut does happen, which fortunately is very rarely, its seriousness is sufficieut illustration of the importance of keeping the cable in the highest state of efficieucy. In this regard it is the wisest economy to replace a eable the moment it shows signs of being in the least unsafe. Proper care lengtheus the life of a mine cable. The effects of heat and dampness can be largely counteracted by lubrication and the application of tar. A cable will wear out faster in a hot, damp mine than iu a cool, dry one.

There are a good many systems of cleaning and preserving mine cables, aud at every large mine the man who has charge of the cablc geuerally prefers his system to any other.

It is believed that while tar is a good thing to preserve the cable from the effects of dampness, yet it is not always worth as high a place iu the preferenee of some as it seems to hold. Tar, of itself, will wear out and destroy a cable, by reason of its stickiness, displacing thc fine strands by adhesion and disruption, while the cable is being wound or unwound. A good anti-friction and preserving compouud for mine cables is composed as follows: Soft tallow, seven parts; plumbago, three parts; mix thoroughly; make a long, hollow box or trough; gouge out a 4x6-piece of scantling about two feet long; saw it down lengthwise, and hollow out the box or trough euough to hold several pounds of the compound, making a hole lengthwise of the trough for thc cable to run through. Affix to rope and clamp securely; have thc box or trough fixed so that it cannot play and let the cable pass through it while going up or down, so that it will get a thorough coating. This will preserve a round cable very well, and can be used at least once a week. For a flat steel cable, raw linseed oil can be used instead of the tallow in about the proportion of six parts of oil to threc of plumbago to get the right consisteney. When tar is used, linsecd oil should be added to keep the tar from adhering, both ingredients to be mixed while warm.

The Assessment Suspension.

Senator Perkins and Congressman Caminetti send us the official text of the bill suspending mining assessments. It is as follows:

An Act to amend section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States relating to mining claims.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the provisions of section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, which require that on each claim located after the tenth day of May, eighteen hundred and seventy-two, and until patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year, be suspended for the year eighteen hundred and ninety-four, so that no mining claim which has been regularly located and recorded as required by the local laws and mining regulations shall be subject to forfeiture for non-performance of the annual assessment for the year eighteen hundred and ninety-four: *Provided*, That the claimant or claimants of any mining location, in order to secure the benefits of this Act, shall cause to be recorded in the office where the location notice or certificate is filed on or before December thirty-first, eighteen hundred and ninety-four, a notice that he or they in good faith intend to hold and work said claim: *Provided, however*, That the provisions of this act shall not apply to the State of South Dakota.

SEC. 2. That this Act shall take effect from and after its passage.

Approved July 18, 1894.

It will be observed that the bill is similar to the one passed last November for '93. It originally exempted the second Congressional district of Colorado. It will this year operate more generally in the liues iutended. being passed four months earlier than last year.

GREAT OBJECTION is made by Utah's mining papers against the appointment of J. B. Rawlings as Territorial mine inspector. The claim is made that he is totally destitute of mining knowledge.

CONGRESS has been in session a year. The record of what it bas done is very brief.

Concentrates.

MINERS' wages at Kennedy district are $3 per day.

A NEW 60-stamp mill is being put in by the Telluride Consolidated M. & M. Co.

GRASS VALLEY has accepted plans for a system of sewers to cost $40,000. It needs 'em.

THIRTY men have been temporarily laid off at the Crown Point mine, Virginia, Nev.

A $35,000-MILLING OUTFIT is being put in at Sherman, Colo., for the West End G. M. Co.

THE red oxide ore at the new camp of Kennedy, Nev., is pronounced almost entirely free milling.

TWO Utah men have bought the Blue Jay and Keystone mines, Albany Co., Wyoming, for $15,000.

JAMES HACKETT is working his mine at Rough and Ready, Nevada county, by the hydraulic process.

THE Rex Gold Mining Company has incorporated with $400,000 capital stock; to operate in Lake county, Col.

IT is alleged in Salt Lake that the famous Dead Man's mine in Uintah county, Utah, is simply a salted "fake."

THE Poorman (Idaho) is again shipping its daily quota of concentrates—fifty tons. About 175 men are employed.

THE Empire mine is reported sold to three San Francisco men, who will put up a stamp mill and chlorination works.

JAS. MONAGHAN'S Cariboo claim in Camp McKinney on upper Kettle river in British Columbia recently yielded 31 pounds of gold.

MINERS are said to be deserting Globe, Arizona, in large numbers. It is thought the shut-down there will be of long duration.

A COMPANY has been formed in Europe with a capital of $250,000 to establish hydraulic works on Williams creek in Cariboo.

THE Government is building a road from the Columbia river to Cariboo creek, the scene of the latest placer excitement in British Columbia.

FIFTY more miners have gone to Rush Creek, Plumas Co., to work, and the bed of the channel for three miles is now staked off for claims.

THE Hope, Montana, Mining Company's recent dividend of twenty-five cents per share makes a total of $558,250 in dividends paid by that Company.

HUGH L. COOPER, on the Pen d'Oreille river, B. C., has secured a lease from the Government of a thousand acres of placer claims which prospect well.

THE American National Gold Mining Company is a new Colorado incorporation; capital $100,000; will operate in Gilpin, Clear Creek and El Paso counties.

THE Little Chief Mining Co., at Phœnix, Arizona, has bonded the Jones properties on Cave creek, bought all the Mormon Girl plant, and will push things.

AT the assay office at Helena, Montana, the purchases of gold bullion for the first half of '94 aggregated $900,711; for the first half of '93 the aggregate was $518,980.

THE statement in the Cripple Creek *Journal* which says that a half-interest in the Hidden Treasure lode has been sold is denied. The World Company still owns the entire claim.

IN the Evening Star mine at Grass Valley, which gave such good returns years ago, the new shaft is reported to have cut the main ledge, and there is every prospect of rich ore yield.

OWING to the death of Stephen Sherwood the celebrated Sherwood mine at New River, Trinity county, is shut down, awaiting the appointment by the probate court of an executor of his will.

THE July purchases of gold at the Denver assay office, or branch mint, aggregated $800,000: for July, '93, the aggregate was $216,000 illustrating the increased activity in the gold mines of Colorado.

THE Tuolumne *Independent* says Thomas Ewing now has a controlling interest in the Black Oak mine at Soulsbyville, and that he will build chlorination works and increase the mill's capacity.

ALBUQUERQUE, N. M., thinks a new smelter is a necessity there. One mine-owner with 1000 tons of ore in sight and 100 tons on the dump offers a half interest in his mine for the establishment of one.

DR. CYRUS TEED now announces that he "can make gold" for $6 a ton. Of course, like all such people, he thinks that whoever disagrees with him is "silly," and that when he dies wisdom dies with him.

THE seventy-five employes of the Providence Mining Co., at Nevada City, Cal., donated one day's work last month to Harry Shearer, an unfortunate fellow miner who was badly injured by a cave recently.

THE White Pine *News* says seven tons of gold rock from the Serpent, located in Osceola district, were worked at the Chainman mill last week and produced a bar valued at $285, an average of $40 to the ton.

THE African Gold Recovery Company announce that 51,500 ounces of gold have been recovered at the Randt, and 6500 ounces in other districts, total 58,000 ounces during June, by means of the cyanide process.

WITHIN one year, says *Ores and Metals*, the cost of erecting a stamp mill in Colorado has been reduced 30 per cent. Formerly the cost was $1000 a stamp, while now it is $700 a stamp. The cheapness of iron permits this.

THE Bassick Gold Mining & Milling Company has been incorporated at Salt Lake, Utah, with a capital stock of $5,000,000. The company owns the Bassick mine in the Hardscrabble mining district, Custer county, Colo.

THE Bi-Metallic Company in Montana has finished a lixiviation plant for working tailings from amalgamation. It has 12 ore vats of 22 feet diameter and 10 feet depth, which will hold 150 tons each. Its capacity is 300 tons per day.

THE Bland Mining and Milling Company has incorporated at Helena, Montana. The incorporators are John Lynch, Geo. B. Wilds, James W. Hamilton, Wm. H. Smead, Joseph Murphy, Wm. A. Simons and John Doudell. Capital stock, $250,000.

THE Mountain View Gold Mining Company has incorporated in this city; directors—James H. Hall, J. M. Kaufman, Thomas A. Dehay, Henry Phillips, William H. Chapman; capital stock, $1,000,000, of which $5,000 have been subscribed.

THE Oaks Consolidated Mining Company has incorporated in this city: directors—James L. Rathbone, A. H. Rapp, Charles E. Shafer, Thomas A. Fisher and Thomas Ewing; capital stock, $1,000,000, of which $750,000 has been subscribed.

THE yield from the gold ore presented to the committee in charge of the Fair mining exhibit when run through the mill was $1258, exclusive of four tons of sulphurets worth $100 a ton. About one-half of the total yield was from Nevada county ore.

THE Boyce gold-saving machine, for saving the fine gold of Snake river, is in operation at Blackfoot, Idaho. It is said to save 95 per cent of the gold. In operating a machine of thirty yards' capacity per every ten hours there were cleaned up $119.

THE Angels Milling Company has incorporated. Principal place of business, Angels Camp. Capital stock, $3,000, with George Stickle, Jr., Robert Rasmussen, Eugene B. Cushing, Robert Gardner and John H. Carley of Angels Camp as directors.

THE Amador *Dispatch* says: A nice little nugget of gold, worth about $117, was picked up one day last week in the Eckhart claim, at Volcano, by T. Eckhart and a man working with him. It was a solid piece of metal without any mixture of quartz in it.

THE Nevada City *Herald* says that the Anti-Debris Association became anxious because "the South Yuba was considerably muddled for a few days, but from what source is not known." It is enough to muddle even a river to have the association watching it.

D. R. CAMERON, sheriff of Shoshone county, Idaho, is reported as saying that matters there are in a very precarious condition, and the continued presence of troops is absolutely necessary. Without them business would cease and life and property would not be safe.

IT is reported that the Kansas City Smelting and Refining Co. and the Mexican Central will build a branch road 100 miles from Jimenez, past Paral to the Buencevi mines in Mexico. The necessary concession has been granted by the Government and surveys made.

THE Alaska-Mexican Gold Mining Co. reports the cleanup for the month as follows: Period since last return, 31 days; bullion shipped, $15,951; ore milled, 6250 tons; sulphurets treated, 100 tons; of bullion there came from sulphurets, $3181. The working expenses for the month were $12,472.

IT is thought there is a prospect of opening up the Meadow Lake mines this season. Denver companies come with processes for working the rebellious ores. No one has ever doubted the essential richness of the mines there, but so far no process has been found to give wholly satisfactory results.

THE Bodie *Miner* learns that C. E. Loose owns two-fifths of the stock of the Provo Con. Milling and Mining Co. of Provo, Utah, and is the superintendent and manager of the concern. It is a silver proposition, and though there are only twelve men at work $40,000 has been paid in dividends the past four months.

THE Pelican-Dives mine near Silver Plume, Col., is reported to have more ore in sight now than it had at the time of the great trouble in the 70's before the consolidation of the two properties, and that there is ore running from the shaft that will average $200 per ton. About 200 miners are now employed.

THE Sand Creek Mining and Improvement Company has incorporated at Butte, Montana. T. A. Grigg, D. R. Barlow and C. H. Sherwood are the incorporators. To conduct a general mining business, reduction and smelting of ores, lease, sell and deal in mining property. Capital stock $1,000,000. Principal office in Butte.

A. W. CALLEN has sold the Prolific and Manzanita gold mines, at Placeritas, Arizona, to the Isabella Mining Company of Chicago for $100,000. The new owners will put up a mill having a capacity of thirty tons a day, and build a good wagon road from Placeritas to Morgan station, on the line of the S. F. P. & P.

E. S. STOYBER and F. Meier, of Silverton, Col., proprietors of the Silver Lake mines in Colorado, are arranging for the building of electric machinery with which to operate their mines. Their mines are located on the mountain side, and they intend to generate electricity by utilizing the waterfalls and putting in dynamos.

IN the vicinity of Alleghany, Sierra county, considerable activity in quartz mining is reported. Three ten-stamp mills are building—one for the Rising Sun Mining Company, another for B. B. Lewis and John Fessler, and one for Henry Johnston, which is expected to be running next week. There is a good country there worth developing.

THE United States Economical Reduction Company is building a reduction works at Florence, Col., for the treatment of refractory gold ore, that is expected to be the largest in the State. It costs $200,000 and will be unique in combining plain amalgamation, carbon reduction amalgamation, chlorination and a modification of the cyanide process.

AN enthusiastic correspondent of the Denver *Record*, writing from Salmon City, Idaho, figures out in a 1½-column article that fourteen miles from that place there are 10,000,000 yards of "fine grained, soft, silty rock" that samples $2 a yard. Twenty million dollars ought to be enough of an inducement for some one to get in with a fine gold process.

THE Last Chance Mining and Milling Company, with headquarters at Almo, Cassia county, Ida., has filed in the office of Secretary of State Curtis its articles of incorporation. Of the capital stock of $200,000, $175,000 is paid up. The incorporators are Thomas P. Potts of Woodland, Utah; Edwin Dowden, of Salt Lake; James M. Durfee, John Potts and T. H. Potts of Almo.

AN important decision was recently rendered by Judge Hawkins in Northern Arizona in the case of the United Verde Copper Company vs. County Treasurer. The suit was brought to restrain the tax collector from selling ore assessed at $30,000 for delinquent taxes. The judge held that ore on the dump was subject to assessment and taxation. The case will probably be appealed.

THE new twenty-stamp mill of the Sunrise Mining and Milling Company is in operation at Phillipsburg, Montana, with ten stamps. The mill plant has cost the company about $20,000, which seems a high figure for a twenty-stamp plant; but, says the *Mail*, considering that the engine and other machinery was purchased in view of furnishing power for more extensive operations, the cost is really considerably less than it would have been in times of ordinary prosperity.

THE Central Copper Mine Co. of Kewanee, Mich., shut down last Tuesday, thus closing a forty-year term of continuous operation of that mine. The shutdown is due to the exhaustion of the vein and the failure to find other deposits on the company's property. Four hundred men dependent on the mine are out of employment. This ends the copper-mining industry in that section.

LAST Tuesday, at Colorado Springs, Idaho, the Portland Gold Mining Company became sole owner of the Annalee and Doubtful lodes, formerly owned by the Amazon Company, and the Bobtail No. 3, an undivided seven-sixteenths interest in the Bobtail, the White House, National Ball and Captain lodes, formerly owned by the Battle Mountain Company; consideration, $500,000 cash.

THE Park, Utah, *Record* says the Deer creek gold excitement has faded into nothingness. There is no yellow metal to be found in the canyon. Old prospectors simply looked the country over and then left without wasting any strength in digging, being convinced from the formation that it would be only time wasted. The many holes sunk by novices without results show how true was their judgment.

THE Stevenson Gold & Platinum Hydraulic Mining Co., Ltd. has been incorporated under the laws of British Columbia, with an authorized capital of $1,000,000, to develop a placer mining claim at Granite Creek, containing 640 acres. Tests on the upper benches, which average from 30 to 150 feet in depth, have given returns as high as $1.50 per cubic yard, but the average is expected to run 25 cents.

THE Toledo mine and concentrator on Mill creek, west of Sheridan, Montana, were sold last week at sheriff's sale for $6000 to Levi Cartier, who held a mortgage of $6500 on the property. The Toledo, in the days when silver and lead were worth a fair price, was one of the best properties in that district, and the mine is by no means exhausted. The concentrator was erected four years ago at a cost of $12,000.

GEORGE J. PERKINS of Truckee is the inventor of a water tube boiler for locomotives. The *Republican* says he has been in the East for about a year testing his invention, and has succeeded in organizing a company at La Crosse, Wisconsin, with a capital of $800,000, to manufacture and introduce the boiler. It is claimed that its use will save 25 per cent in fuel, and with it no fire is emitted through the smokestack.

THE Tehama Mining & Milling Company has incorporated at Ogden, Utah, with a $750,000 capital stock. The mining properties are located in the Bountiful mining district, Davis county, Utah. The mines are said to produce free milling gold ore, not of extraordinary richness, but the ledge is of vast extent. The mill site and water power are perfect, and the situation of the mines is such that the ore can be mined at a very low figure.

RECENTLY the entire 120 stamps of the San Miguel Consolidated Bear Creek mill and the forty-stamp Gold King mill, at Telluride, Col., were dropping simultaneously making a power test, which proved satisfactory. The distance from the mouth of Bear creek, where the connection was made with the electric-power line of the San Miguel Consolidated to the Belmont mill, is four miles. The distance from the mill to the generating station at Ames is nearly 14 miles.

MEN employed at the Derbec drift gravel mine near North Bloomfield, Nevada county, quit work last Tuesday night because the management attempted to reduce their wages from $2.50 to $2 a day. The mules that have been hauling cars underground were brought to the surface and the machinery stopped. Wages in the county for gravel miners have long been $2.50 a day, and for quartz miners $3, and although repeated efforts have been made by some of the operators to reduce, they have in every instance been unsuccessful, despite the fact that the miners have no union.

AT El Dorado canyon, Lincoln Co., Nev., the Southwestern Company has suspended operations for a time, until arrangements can be made to secure supplies at a lower figure than has ruled for several years past. This is necessary from the fact that the ore deposits, though good, will not bear the unusual expense incident to mining in that out-of-the-way section. River charges have always been high, relatively, and freighting overland from Kingman, Ariz., renders it necessary to ferry everything over the river. Recently a road has been laid out from Vanderhilt to El Dorado, a distance of forty-nine miles, which, with some repairs, will be practical, and it may be that when resuming operations this route will be used and some station on the Nevada Southern made a shipping point, say Manvel or Vanderhilt.

Clipped and Condensed.

CHOLERA is spreading throughout France and Russia.

DELTA, Cal., was almost entirely destroyed by fire last Tuesday.

A $50,000 CASK of gold from New York was stolen while in transit from Havre to Paris.

THE House and Senate Conference Committee on the tariff expect an agreement on that measure this week.

THE result of the recent great strike is reduced work and wages in all branches of labor in and around Chicago.

BY a new ruling the Government Fish Commission and the Geological Survey are attached to the Agricultural Department.

THE Labor Commission appointed by the President to investigate the causes of the recent strike will hold its first meeting at the Postoffice building, Chicago, on the 15th.

IN two naval battles off the Corean coast the Japanese fleet sunk two of China's best modern ironclads, entailing great loss of life by drowning. China will confine further operations to land.

POPULIST SENATOR ALLEN of Nebraska has introduced in the U. S. Senate a bill to provide for the issue of $50,000 in treasury notes to be distributed among the States for the relief of the worthy poor.

EUGENE BRADEN has been appointed Assayer in Charge of the U. S. Assay Office at Helena to succeed W. F. Wheeler.

A Colorado Gold Mine.

(*Continued from page 65.*)

come productive. As depth increased the ore became more solid. In the Whale and Hukill little or no lead ore was found. In the Standley a lead zone was found, which in depth became the usual iron and copper pyrites. The silver values were greatest in the upper workings; with greater depth the silver diminished and the gold increased. Ore from the upper workings averaged 70 to 100 ounces silver per ton, and $1.50 to $1.75 gold in the lower workings.

The ores at present are dry quartz ores, mainly composed of iron and copper pyrites, with purple copper or hornite, and bright irridescent-hued peacock copper. There is not much free gold in the mine, nor does it appear there ever was, even at the surface, where it is generally found most abundant. The gold values increase with depth, especially at the bottom of the shafts; whilst laterally lead ore is found near the surface. Over two-thirds of the developed ground has been productive. The vein has been opened for over 3000 feet continuously, and prospected on the surface for 3000 feet further.

There are 14 lode claims, six placers covering 7000 feet of the vein and two miles of the creek. There are five principal ore chutes, or zones of principal mineral deposit on the vein, with average intervals between them of 200 or 250 feet. These ore bodies are more likely to be found under gulches and depressions on the surface than under mountain crests. The ore averages in silver 30 to 40 ounces per ton, and gold 2½ to 4½ ounces. Some of this ore, being poor and low grade and mixed with much rock, is a concentrating ore, and some of it goes direct to the smelter. The average assay value of the present ore is:

FIRST CLASS.	
Silver in copper ore	35 ounces
Gold	2½ ounces
Silica	26 per cent
Iron	24 per cent
Copper	5 per cent
SILVER IN LEAD ORE WITH NO ZINC.	
Silver	25 ounces
Gold	1¼ ounces
Lead	30 per cent
Silica	20 per cent
Iron	15 per cent
CONCENTRATES.	
Silver	20 ounces
Gold	2 ounces
Iron	23 per cent
Silica	16 per cent

The vein would popularly be classed as a so-called "true fissure vein," but if by this is meant that there was once a wide open fissure five to ten feet wide gradually filled with ore and quartz, there is no such thing there. Doubtless there was once a crack in the rock, similar to the cleavage plains or joints we have described in the canyon. This fissure or line of weakness, along part of its course, became a zone of alteration or mineralization of the country rock adjacent to it. The so-called vein exposed in the roof of the tunnels or on the face of the stopes, is in some places simply a line of rusty, rather decomposed rock, but a few inches wide close to the footwall. The remainder of the vein or gangue above the footwall is generally the ordinary gneiss or schist somewhat rusty, with little seams of quartz or feldspar, and little streaks of ore, an impregnation rather than a well defined vein. This mineral impregnation grades gradually into the country rock without any well defined limiting hanging wall. The vein in this part may be described as a zone of mineral impregnation near a line of fracture.

Farther on this zone is occupied by a singular combination, consisting of a belt of breccia five feet wide, formed of fragments of porphyry and granite. (See Fig. 1.) Though most of the fragments are angular, both porphyry and granite often assume a perfectly rounded pebble-like form. Running in and out between these blocks, and often acting as a cement to them, is the ore, mingled with quartzose matter, or by itself alone. Sometimes this breccia lies in two well defined zones on either side of a central mass of quartz and feldspar, speckled and veined with ore. In most cases the richest smelting ore lies by itself in a narrow zone between the breccia and either the hanging or footwall of gneiss.

FIG. 1.—VEIN PHENOMENA.

H. W.—Hanging Wall. F. W.—Foot Wall. R. O.—Rich Ore. C. O.—Concentrating Ore. Q. F.—Quartz, Feldspar, Etc.

This part of the vein doubtless originated in a fissure, which was enlarged by the eruption of the volcanic breccia, which carried up in its embrace fragments of the granite torn from the sides of the fissure, and pieces, too, of congealed porphyry; and, either by alteration or partial melting, reduced them to rounded pebbles. This may have been assisted by steam, but it seems hardly possible that underground waters circulating in the fissure could have given the fragments their rounded form.

Such a breccia zone, impregnated with ore matter, may seem anomalous, and different from the orthodox idea of a fissure vein. It is not, however, uncommon in these mountains for a porphyry dike without the presence of quartz to be impregnated by mineral and to constitute the vein to all intents and purposes, as, for example, the vein of the Mattie mine in the same neighborhood, which is only an impregnated porphyry dike.

It is to be observed that a dike of porphyry runs close by, back of and parallel to what should be the hanging wall, very nearly making the vein a contact vein, between porphyry and gneiss. (See Figs. 2 and 3.)

In one case, toward the end of the third level north, this dike has entered and absorbed the usual zone of the breccia vein, and retained only the narrow zone of the rich smelting ore between it and the gneiss, making this part of the vein a true contact.

This barren porphyry again in places cuts through both breccia and vein, and at others intrudes long, narrow tongues into the gangue. The vein never passes through this porphyry, but is thrown by it. Hence it appears that though the porphyry seems of the same nature as that in the breccia, yet it must have been erupted after the breccia, and after the breccia was mineralized.

This porphyry, of a light color, seems to have been reduced to a highly plastic or even molten condition, for it insinuates itself into every crack and crevice in the vein was found on reaching it to be somewhat scanty, and lying on the well defined footwall; the hanging wall was less definite. Both walls were of granitic rock. Contrary to the popular idea, two well defined walls, *i. e.*, footwall and hanging wall, are very rare in mines in this region. There is commonly but one wall, and that often but ill defined. The footwall in an inclined vein is that which slopes away from you, and upon which your feet would naturally lean toward, whilst the hanging wall is the opposite side of the tunnel where the rock naturally overhangs you or slopes towards you. A wall in a mine is generally recognized by a prevailing smooth

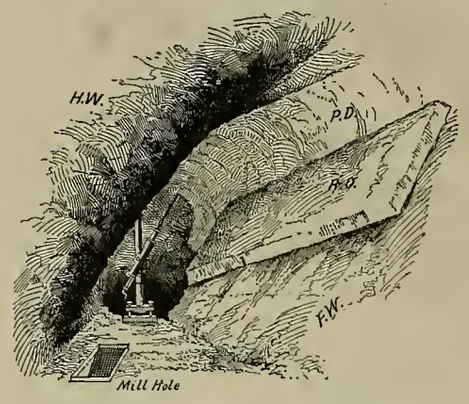

FIG. 2.—CONTACT VEIN IN STOPE OF 3d LEVEL.

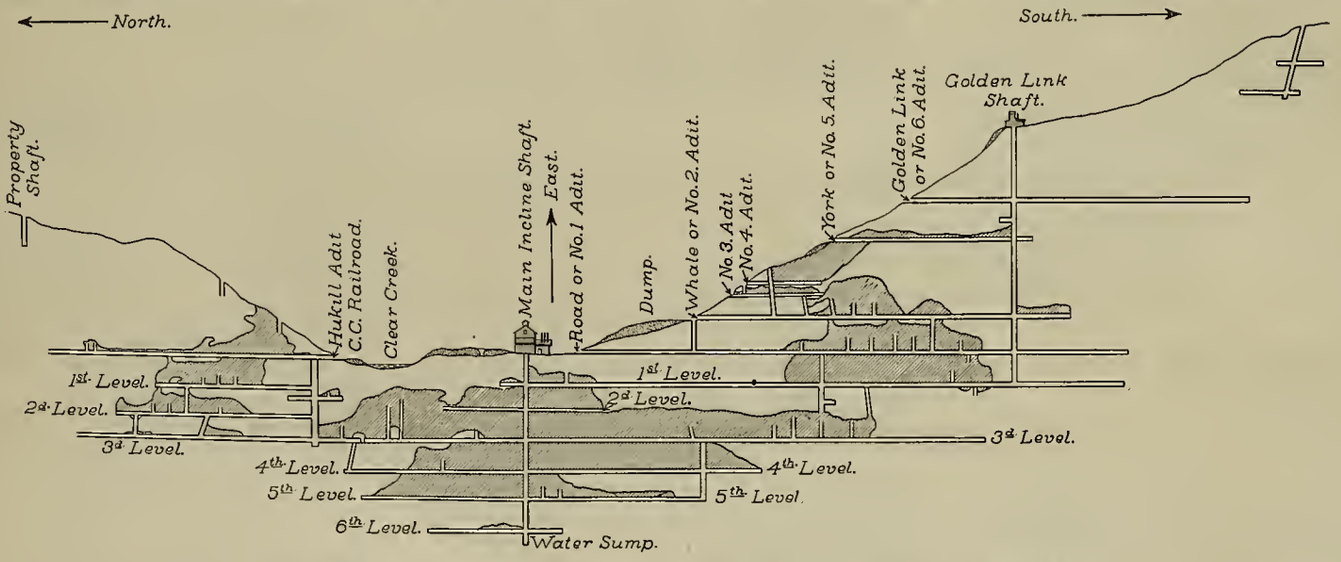
They incline inward at a slight angle toward the cap. Back of these the walls were lined with lagging. On the floor was the tramway, the rails 18 inches apart, laid on ties as on a railroad.

This diagonal crosscut reached the vein at a distance of 200 feet, when the rock becoming firm and solid no more timbering was required. The ore of



COMPLETE LONGITUDINAL SECTION OF THE STANDLEY CONSOLIDATED MINE.

aud is constantly and most unexpectedly met with in the mine.

The course of the vein is northeast and southwest dipping to the west at an angle of 68 degrees from the horizontal.

Entering the mine by the level on the south bank of the river, known as "Level A" (see plan of workings), for some reason, though but a few feet from the outcropping vein, it was not driven in directly on it, but aimed to cut it by a long diagonal crosscut. This level was eight feet high by five feet wide. It was well timbered for the first few hundred feet, owing to nearness to the surface making the roof and walls of rock loose aud unsafe. The stulls or upright timbers as well as the cap or top of the arch were of sawn timbers, cut square, eight inches thick.

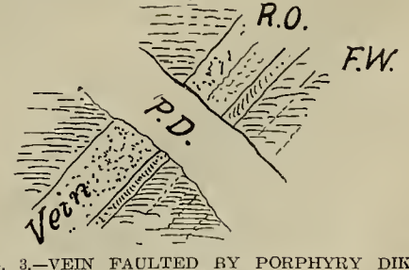


FIG. 3.—VEIN FAULTED BY PORPHYRY DIKE, 3d LEVEL.

surfaec on onc or both sides of the vein. The so-called vein, as we have deseribed, was here but a rusty linc in the granitic rocks. After 500 feet of this poor material, richer stuff was encountered, which induced them to stope upwards. The rich streak or chute continued to the breast or end of the level for some 1500 feet, where operations are still continuing.

In stoping, an upraise is made by a power or air drill in the roof of the tunnel to a height of perhaps 50 feet. See Fig. 4, where the air drill pillar is planted in the tunnel and the drill is in the roof. An opening upwards is thus made, the dirt from the ex-

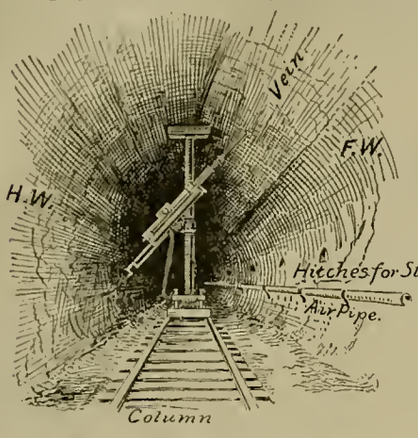

FIG. 4.—DRILL, PREPARING TO STOPE. COLUMN SET VERTICALLY.

cavation falling into the tunnel below. From this chute, stoping is eommenced; that is, exeavating along the vein on either side of this chute, beginning at the bottom. In doing this, the drills are directed in a slantiug direction downwards, so that water can be poured into the holes to assist drilling. In this stope the gangue matter of the vein is blasted down first, away from the richer streak of ore, which in this mine invariably lies elose onto either footwall or hanging wall, generally the footwall. Previously, however, so soon as stoping begins, thick stulls are laid aeross the upper part of the tunnel from wall to wall, each of them five feet apart from centers, and on these are laid lagging of poles 15 feet long, forming a floor on top of these stulls. (See Fig. 5.) The cross stulls in this case were the width of the vein, and two feet thick. The butt end of a stull is laid in hitch or square notch, eut in the face of the footwall, and the other end is jammed down on to the head in the hanging wall at a nearly right angle with both walls.

These stulls in this mine, with inclined walls, have to be very thick and strong to support the enormous pressure of the hanging wall, a pressure in this mine increased by the swelling of a body or dike of porphyry behind the hanging wall.

The stulls and lagging having been laid as a floor, the work of stoping upwards progresses. The dirt

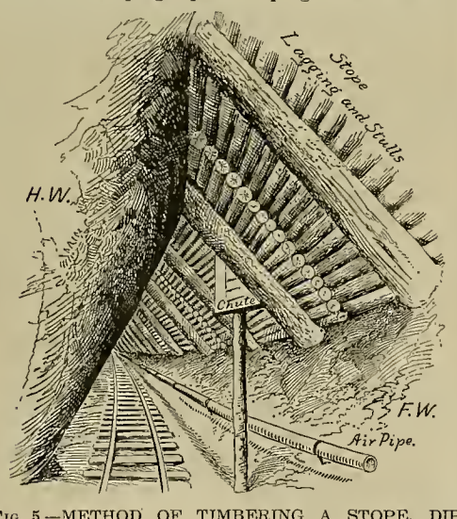

FIG. 5.—METHOD OF TIMBERING A STOPE. DIP OF HANGING WALL 68°.

falls on the lagging of the floor, but much of its pressure is distributed over the sloping surface of the footwall, instead of all on the floor of lagging and stulls. (See Fig. 6.)

On top of the dirt that falls from his work upon the lagging floor, the miner stands to contiuue his attack on the roof of the stope (See Fig. 7, on page 65, and Fig. 8) with the power drill, whose pillar may be, as in the illustratiou Fig. 8, placed across the stope horizontally or else vertically.

After the poorer rock of the gangue (*i. e.*, the vein part from wall to wall) has been blasted down, and scaled off from the streak of rich ore that in this case lies close to the footwall, the poor, barreu rock is broken up small to make a somewhat smooth floor to receive the precious ore as it is broken down. This, if soft, is either taken down with a piek or gad or else blasted down with a light charge of powder.

In Fig. 7 the men appear to be taking the ore off the footwall with hammer and chisel.

Meanwhile, to dispose of this ore and get it down safely into the tunnel below, a chute or mill hole has been kept open and carefully timbered with small eross sets of timber to the level of the floor of the stope (see Fig. 8), where it is as an open chimney down which to throw the ore into the tunnel below, where a car stands (see Fig. 9, on page 65,) ready to receive it and carry it out on the dump, to be wheeled to the mill or sorting room or to the incline shaft for hoisting. As the dirt on the floor of the stope rises, additional cross pieces are added to keep the mill hole or ore chute free and clear from stones. The mill hole is wider at the bottom, which is called a pocket, than at the top. This enlargement is doue to prevent stones clogging, hence the mill hole is in the form of au inverted funnel.

Down this ore chute the ore is dumped into the car in the tramway at the bottom of the tunnel.

Very rich ore is sometimes carefully broken down on a blanket spread on the floor of the stope.

The result of driviug the drill holes down in a slanting direction is finally to make one end of the stope higher than the other.

On reaching near the upper level, if the ore is not very valuable, a pillar is left, or else it is stoped clear up to the track and filled in. The vacant space is filled by stoping on one side and filling in, laying cross pieces from wall to wall to support the rails of the upper level whilst this is in process. Commonly this part is filled up during the night shift, so that by morning the cars can run ou the rails of the upper level.

Mill holes or ore chutes, as they are called, are generally placed at every 40 or 50 feet apart. Men may be working at one end of a stope, and others at

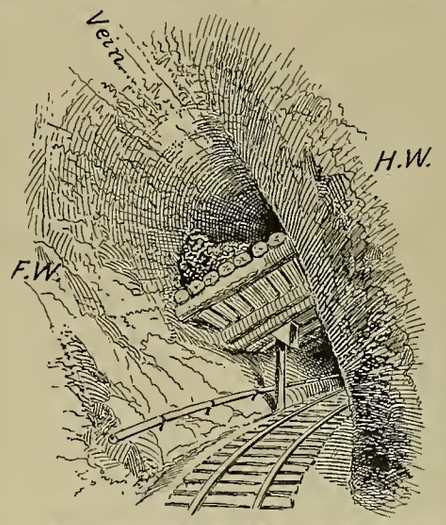

FIG. 6.—END VIEW OF A STOPE SHOWING HOW THE WEIGHT OF FALLEN ROCK IS DISTRIBUTED ON FOOT WALL AND LAGGING.

the farther end, the drilling holes converging toward the cutter. The cross-section of the vein is well seen on the roof and end faces of these stopes.

The gangue is generally a breccia, more or less impregnated with ore, which will pay to concentrate, but is not rich enough to smelt. The smelting rich ore keeps elose to one or the other of the walls and is sometimes a solid mass of pyrite or quartz and pyrite.

In blasting, dynamite is used. The power drills usually drill in a few hours half a dozen holes six or eight feet dcep, according to the amount of rock they desire to break down. A power drill will do in six hours what it would take a man by hand labor a week to do. When it is desired to break down a great quantity of rock, a number of holes are drilled at different distances and the charges ignited simultaneously by an electric battery.

The pillar mode of supporting the drill in these narrow veins is here preferred to the tripod system. The pillar can be placed in any position horizontally or vertically, and they have them of all lengths to suit different widths or heights of the tunnels.

The main air pipe supplying power to the drills passes along the side of the main levels, low down, but above the ground, and is four inches in diameter. Smaller inch pipes of iron are attached where side drifts branch off to supply the drills and to the end of these pipes about 50 feet or more of hose cased in wire is attached as a flexible attachment to the drills themselves. Two men atteud upon each drill.

Along the main tunuel, at a certain point, a cross-cut had been made into the footwall, which showed that the vein here had split up into three branches, each of them of fair size and valuable. This shows the importance of occasionally prospecting and cutting into the walls. On one of these veins was a lofty, open, untimbered stope. Here was encountered the porphyry dike which runs back of and parallel with the hanging-wall. Therc were placcs in the tunnel where they contemplated stoping, where the air drill was already in place and about to drill a chute in the roof. The hitches, too, for the

FIG. 8.—DRILL WITH COLUMN USED HORIZONTALLY.

butt ends of the stulls were already cut, ready for the carpenters to lay in the stulls (See Fig. 4). It is the carpenter's business to cut the hitches and prepare and set up the stulls and lagging.

In Umtali, Mashonaland.

From Umtali, Mashonaland, South Africa, John Jarvis, a Montana miner, writes regarding that far-off region of Portuguese territory:

The town contains several stores, two canteens, a postoffice, two butchers, a baker who is an American negro, a reading room and library, Episcopal church and a hospital. Six troopers of the Mashonaland mounted police are stationed outside the town. They are needed to keep order among the natives.

This country needs a railroad badly. To bring merchandise and machinery from Pretoria or Veyburg is both slow and costly. The distance is about 800 miles from either point. The least time that it can be made in is three months. Sometimes it takes six months in the rainy season. The rivers get too full and the transport riders have to wait until the water goes down before they ean ford them. There has been a good deal of agitating, urging the British South African Compauy to push the railway through the fly country. Oxen and horses cannot live in that part. The fly stings them and after some time they die. Last year the company gave a bonus to pay losses so as to get goods from the seventy-five-mile peg, but it was ouly given to one party, who did very little transporting, while those who risked going to the seventy-five-mile peg and lost their eattle got nothing except what they made transporting. The cost of living here is very high. Decent board cannot be had at less than £8 per month. If you board yourself it might be done for less. Everybody here keeps one or more negro servants to make the fires, carry water from the river and go out and bring in wood for fuel. Their pay is 10s per month and their food, consisting of Kaffir meal (or cornmeal) and meat once or twice a week. They seldom stay more than one month, then you get a green one and you have all your teaching to do over again, and as likely as not you get one from an entirely different tribe, whose language differs. Then there is a job to make him understand. As an example: The word "banga"—a knife—is what the negroes around Salisbury use, while those around here have another word for knife.

The people of Umtali are very enthusiastic over this mining district. Quite a number of people have assured me that this will be "the place."

I believe that this will be a good mining country. It only requires the 50 per cent tax to be done away with. A mining claim here is 150x400 feet, and a person is allowed to peg out ten elaims in a block. If you work the claim yourself, the company takes half the profits, and if you float it into a company they get half the shares. When this law was made it was understood that the money was to go toward building a railroad. We have not got the railroad yet, but still have the tax. I have no doubt but that this outrageous tax will soon be abolished. Then, and not till then, will it be advisable for people to come here. I have made a mistake in coming here too soon. I had far better have stopped in Johannesburg or some other part of the Transvaal.

OREGON papers say that the Isaac Banta gold machine, which is an ordinary sluice box in which chemicals are used to assist in separating the gold from the black sand, is being used with considerable success in black sand beach mining. Five of the sluices are in operation south of Seal Rocks, and others are being made ready to go to work.

THE South African *Mining Journal* vigorously opposes the proposition to make the cyanide process a Government monopoly, with royalty to be ebarged all nsers thereof. Speaking of the African Gold Reeovery's part in the proeeedings, it says:

"We are quite ready to admit that tbe company is the only manufacturer of cyanide who has stood between the ring of European manufacturers of that article and the mining industry; and that by refusing to join the ring it bas kept the price of cyanide down to 2s 1d when it would otherwise have been raised 4s or more. In that respect, in the fact that it has retailed cyanide to its lessees at eost price *plus* 10 per cent for incidentals, storage, etc., looking only to its royalties for its profits, it has deserved well of the indnstry, and its adaptability to keep the price down should have been allowed for in the negotiations which went on for the reduction of tbe royalty; for, if the compauy had gone into the ring, the indnstry might have had to pay, not £250.000 per year for its cyanide, which is the present approximate rate of consumption, bnt £400,000 or £500,000.

"But in secretly negotiating with the Government for this new monopoly in place of its patent, has it still adhered to its old principle of profits from royalty only, and not from cyanide? What gnarantee have we that the State monoply price of cyanide will not be as artificially fixed as that for dynamite, and this on top of tbe ontrageons royalty of 25 per cent which it is proposed to exact from all the gold won by its agency? Tbe stone, to employ the simile already suggested, is, in very truth, now in the hands of an insatiable and reckless Government. We may be perfectly certain that it will be carried to its most mischievous goal. Cyanide gold will presently not be worth prodncing at all. Let Mr. Kruger bear in mind the nnassailable economic trnth that there is a limit of taxation beyond whieh it ceases to become productive of revenne, and that he may heap tax after tax npon tbe industry, only to find that with every fresb one he devises the return to Government is growing steadily less. He may drive foreign capital out of the country—if capital is willing to go withont a struggle. There is one other aspect to this matter, which is of no trifling importance. All stimulns to the research after improved methods of gold recovery will be withdrawn if this new monopoly be constituted. Cyanide of potassinm as solvent and zinc as precipitate might be put out of date any day by some new discovery of science. It will certainly be the intention of Governmeut to provide for that obvions contingency. All recovery processes, existing or in futnrity, will doubtless be comprehensively included in the monopoly. The State, in the case of dynamite, has resolved to appropriate to itself the sole right to manufactnre auy improved explosives which may be invented in the futnre, and patentees are warued off. So it will be in the case of gold recovery processes; so that local inventors may well cease from their labors and enterprising companies may cease to finance them. Can the European investor read of these things, and not ask himself what the end will be?"

THE British Columbia *Miner* thinks that the Canadian Governmeut ought to aid the miniug industry in tbat province to tbe extent of buying diamond drills, to be leased to responsible parties at a reasonable rental. It says: "In the Kootenay the Government might establish one or two drills, under the care of tbe Gold Commissioner, to be let out to individuals at a rate of hire sufficient to pay interest on the cost of investment, proper secnrity being given for its safe return. It is possible tbat it might be advisable for a man skilled in its nse to accompany the drill, and his wages would have to be paid by the borrower. Under an arrangement of this kind the Government, thougb it would be pnt to some little expense at first, wonld find it a good investment, and to tbe public it would be of the greatest advantage. Prospects conld be proved and the direction of fnture developmeut on claims determined."

A CONCRETE ILLUSTRATION of the abstract "being out and injured" is afforded in the ease of H. H. Bancroft of this city, non-suited tbis week in the Superior Court. Some years ago there was a fatal elevator aecident in his Market street building. He compromised the damage snits brought by paying nearly $30,000. He then sned the San Francisco Tool Company for that amount aud $100,000 damages, claiming that they had put in a defective elevator. The defendants claimed that their work was done properly and that plaintiff had misnsed it. Plaintiff's evidence being all in, defendants moved for a non-suit, on the ground that the eomplaint was filed too late, and that the action was barred by the statnte of limitations. The motion was granted, the judge stating that the cause of action accrued at the time of the aceeptance of the design and not when the aecident occnrred.

THE Bank of England uow declines to receive silver exeept at a discount of one-qnarter of one per cent.

An Idaho Bonanza.

The De Lamar Mining Co. in its report of the year's work gives the following statisties:

Wet tons erushed, 39,053.58; dry tons erushed, 35,053.07; assay value of the ore milled: gold, $19.87; silver, $11.93; total, $31.80 per ton; pereentage saved aeeording to assay, $82.63 per eent; aeeording to bullion returns, 81.89 per cent. The pure gold prodnced was 26,483,313 ounces; fine silver, 509,169.19 onnces. The value of gold at $20.67 per onnce was $545,489; and for slag and residues, $6448, making a total of $551,937. The valne of silver at $0.71085 per ounce was $358,473; add for slags and residues, $2427, a total of $360,900. The mill was in operation for the year altogether 335 days 22 hours. The average ore crnshed per stamp per day of twenty-four honrs was 3.48 tons. There were 210¼ tons smelting ore sold, the retnrns on whicb were $117,-274; charges, $38,166; profit; $79,108.

The costs of mining, including prospecting and development work, and all other costs and expenses, direct or proportionate, amonnt to $5.9295 per ton. The costs of milling, inelnding all labor, snpplies and all proportionate expenses, amount to $5.9945 per ton. Total costs per ton, $11.9240, showing a decreased eost for the year on mining of $1.1871, aud on milling of $1.5067; total, $2.6938. In calculating the valne of the ore treated, the price of gold and silver products was based on the average priee realized by the bullion returns, $20.67 per ounce for gold and 71.085c per onnce for the silver.

The total receipts for ore worked and sold were $1,039,369; working expenses, $458,250; profit from working, $581,119. The average amount realized was $26.08 per ton worked.

The revenne accounnt of the Londou offiee gives the following statement: Receipts at mine, £212,116; London office, exchange, etc., £1,524; total, £213,640. The charges at mine were £93,520; London office, etc., £4,954; total, £98,474, leaving a net balauce of £115,166. From this there was used for pnrehase of claims, new machiuery, hotel fire, suspense account, etc., £15,598, and for dividends, £90,000; a total of £105,598, leaving a balance of £9,568. Adding, £30,759 brougbt forward from previons year, leaves a net balance of £40,327 forward to current year.

The directors' report says: The average price realized for silver was 71,085c per ounce, as compared with 84.450c the previous year. the highest figure touched being 84.02c and the lowest 59.13c. The price obtained for shipping ore suffered a similar depreciation. This fall in valnes represents a loss of abont $90,000 as compared with the previous year, or 4½ per cent on the capital of the company. Compared with three years ago. when the property was acquired and all calculations were based on silver at $1 per onnce, the difference is $200,000 aud on the same basis the loss to the company on the three years' operations amounts to no less a sum than $340,000. Under these circumstances it is gratifying to find that as the mine is developed in depth ores carrying a larger proportion of gold preponderate, for while the production of silver shows an increase of 22,032 onnces, or say 4 per cent, the production of gold has incrcased by 7460 onnces, or say 40 per eent, as compared with the previons year. In values tbe ore milled has yielded 60.46 per cent gold and 39.54 per cent silver, against 52.09 per cent and 47.91 per eent in 1892–93.

Very Inconsistent.

The Marysville *Appeal*, in a lengthy editorial on tbe telegram from Caminetti, saying that it is proposed to appropriate $100,000 for the restraining of debris on condition that the legislatnre of California appropriate a like sum, in the course of argnment says:

"The people of the valley will never have peace, nor will the impending ruin to the rivers be obviated so long as it is proposed to mine by the hydraulic process and dump into the rivers with or without restraining dams."

How is this, Brother; not long ago yon admitted, through yonr editorial colnmn, that hydraulie mining *could be carried on without material injury if only proper dams were built.* The truth is you jump whichever way the boss holds out his finger. Why can't yon be consistent for once in your life?—Monntain Messenger.

A New Amalgamator.

E. D. Roth, of Denver bas invented a uew amalgamating machine, consisting of a pan, the bottom of which is nearly convex in form, thus giving the greatest depth nearest its circumference. From the center of the pan rises a tnbe ten inches in diameter, and in the interior of the tnbe is a donble, left hand screw attached to a vertical shaft geared on top and with four arms at the extremity that rest in the pan.

The ore to be treated is first redneed to a pnlp and run through a screen of forty mesh to the inch. It is theu conveyed direct to the tnbe and is earried by the aetion of the donble screw into tbe bottom of the pan, wbich has previously been provided with a supply of qnieksilver. The four arms on tbe lower end of the shaft are eacb fitted with a knife arrangement that cuts the qnieksilver, each knife becoming a mechanical "riffle" as they revolve in the pan.

It is claimed tbat the aetiou of the double screw aceomplisbes a result that has been the aim of every amalgamator—that of placing the pulp below the qnieksilver in the pan by direct action, and in snch a manner as to avoid "flonring" the quicksilver.

The machine is intended to make not more than twenty-four revolutions per minute. As amalgamatiou is being accomplished the quicksilver is drawn off and a fresh supply introduced without stopping the machine.

The machine has receutly received an exhaustive test in the sandbars of Snake river, a number of them are being operated there.

From Cripple Creek, Col.

Under date of July 25th, F. H. Pettingill writes from Colorado Springs, Col., as follows:

With few exceptions stagnation unquestionably prevails throughout the entire list of quoted stocks. Of course, the increasing eastern demand is apparently having some effeet, but sellers are so numerous that it takes a phenomenal demand to create any marked advance.

There are a few tbings I shonld like to correct regarding the Ela Heclna Gold Mining Company of Cripple Creek. There is considerable enthusiasm evident regarding this property, but it is not in a condition to warrant many of the stories circulated regarding it. The company are down about fifty feet, and have a five-foot vein from which assays have been taken running from $6 to $500. The ore body is not continnous, nor is it compact enongh to take out a shipment, or even a mill run.

Mr. J. C. Dickey, the manager, has great expectations at farther depth. Other thau that there is nothing special transpiring. The property is steadily working, has considerable funds in the treasury and is being economically and intelligently conducted.

Pbarmacist is stronger; this is occasioned by a rumor that tbe Jones-Miller factions have come to an understanding by the former disposing of his interests to the latter. Whetber this is authentic or not I am unable to ascertaiu, as both parties decline to discuss matters.

There is one point which is having a bearish effect upon tbe market, and that is the continued disposals of collaterals by money lenders. The abandonment of many paid options is a disturbing element that is enconraging and has made short sales profitable.

From personal observation I am inclined to believe that Cripple Creek has not been in an equally flattering condition for a year. There are apparently more mines in operation, a larger number of miners employed and a greater amount of capital going in to-day than ever. Dividends are being pnt iuto the ground in developing new properties. Prospectors are more numerous in formerly unknown localities than ever. Transportation is going down. Intelligent mine operators are flocking to the camp from every otber mining district in the conntry.

On the whole, it is time that all sbould drop their bearish notions, as there is nothing to feed them on. A boom is soon to come, and it will arrive thirty days sooner than anticipated by the most hopeful.

Several facts are becomiug known that tend to create a sbarp competition between the two railroads entering the camp. Should this come abont, the cost of shipping ore will be greatly reduced.

Yours respectfully, F. H. PETTINGILL.

THE sale last week of the Ibex mine in Detroit district, Utah, illustrates the advance in values susceptible in a mining property when its real advantages and capabilities are set forth. In August, 1890, S. F. Mount, of Richfield, Utah, bought the property for $4000. It was systematically explored to a depth of 200 feet, the ore carrying gold and copper, the gold running $24 a ton, the copper averaging five per cent. It is a lime formation, no apparent limit to the ore body. Last week it was sold to Q. P. Posey and others, of Denver, for $135,-000. They will build a smelter at Oasis, on the Sevier river; iron and other fluxing ore being within easy reach. Anotber thing illustrated by snch development is that it results in putting $1000 a day into circulation for labor and supplies.

THIRTY-FIVE ponnds of giant powder exploded in the Golden Gate mine at Sonora, last Tnesday, killing L. Carr and J. Mahngram. The cause of the explosion is uuknown. The men went to charge and fire several holes in a drift in 350 feet on the 400-foot level, and had only been in the mine a short time when the explosion took place. Great qnantities of smoke shot up from the main shaft, and so great was the conenssion that all the lights in the drift at the 200-foot level were extinguished. The dead body of Carr was found some distanee from where the explosiou occurred. Ouc leg was torn from his body and the other nearly so, and tbe body was badly mangled. Mahngram was literally blown to pieces.

Nevada's Gold Prospects.

In many places on the Pacific coast, says Dan De Quille, a great fuss is made about gold quartz that yields from $5 to $10 a ton. Here but little is thought of such prospects. In regard to some of the gold belts of Nevada, I find the following notices in the local papers for the past three days:

Three and a half tons of ore from the Palmico mine, Hawthorne, yielded $4050 in gold.

A lot of fifteen tons of ore from the Irish Boy mine, Kennedy district, sent to Selby's smelting works, San Francisco, for reduction, paid $512 a ton. The vein is from two to four feet wide.

A ledge, just found, a mile and a half from Unionville, Humboldt county, assays from $140 to $1800 a ton in gold. The vein is two feet wide.

In Lincoln county, Scott Allen accidentally found a vein of iron-stained quartz. He did not think much of his find, but an assay showed that the material contained over $3000 a ton in gold. This find was made in a section of country some distance south of where Captain De Lamar is operating.

These paragraphs are in regard to only a few districts or sections of the many gold belts. In the Kennedy district—first discovered in July, 1891—are the Cricket, Imperial and many other mines as rich as the ones mentioned above. Indeed, it is a region full of rich veins of gold-bearing quartz, and finds are still being made almost every week. No place in Nevada is more worthy of the attention of the capitalist or prospector.

A railroad down through Nevada—as one that would connect Salt Lake City with Los Angeles—would open up many good gold camps. The whole route would be through a region full of mines of the precious metals. Down toward Death valley lies Montgomery district, a good gold camp, but one that is almost out of the world as regards transportation.

Also down near Death valley, in Tule canyon, some rich gold mines should be opened up. On this canyon rich dry diggings were discovered some fifteen years ago. In 1880 a few men were at work there. They had no machines for dry washing, and did not even winnow the dirt by tossing it up in the wind, Mexican fashion. They simply dug over the ground with picks, collecting such pieces of gold as they happened to see. In this way they made good wages in ground from two to four feet deep. Working in this rude way they found one nugget that weighed five pounds, and very many worth from $5 to $75. Pieces of gold worth about fifty cents were about the smallest saved working in this way, "by eye." With water, or even dry washing machines, such ground should have paid immensely. As all the placers in the Great Basin region are of local origin, Tule canyon must cut one or more large and rich veins of gold-bearing quartz. At present we hear but little about these diggings, though there is always more or less gold coming from them, which is said to be ground out in arrastras by some of the ranchers living in the vicinity.

In the early days an impression prevailed among our miners and prospectors—mostly from California—that the gold veins on this side of the mountains would not prove permanent. They said it was merely a surface production and would not hold out in depth. This soon came to be accepted as an established fact, therefore little attention was given to veins that were purely gold bearing by those who went forth on prospecting raids. Now the truth is that our gold mines are the most permanent in the country. The first gold mines opened and worked were in Devil's Gate district, at Silver City. These have been worked right along unceasingly for over thirty years, and to-day are paying their owners as well as at first. Wherever paying gold mines have been found in Nevada they are still paying, as in the beginning, and this is more than can be said of many of the silver mines.

Chinese Hydraulickers in Contempt.

In the contempt proceedings entitled the County of Sacramento vs. James Gould et al., says the Marysville *Appeal*, judgment has been rendered in favor of the plaintiff by Judge Davis.

Ah You and Ah Joe, two of the defendants who failed to appear or show cause as directed, were each fined $500, and in default of payment were ordered to be imprisoned in the Yuba county jail one day for each $2.

The defendants were mining on Deer creek, Nevada county, on what is known as the Red Diamond mine, the debris flowing from Deer creek into the Sacramento river.

Fraudulent Assays.

The Park City *Record* learns of a case of dishonest assaying which, if true, should place at least one assayer at Lehi behind the bars. A miner had a prospect at Tickville, and sent samples of his rock to the Lehi man to be assayed. He got a return of $2 in gold to the ton. This stimulated him and he worked hard, sending other assays from time to time, and getting increased returns, the last showing $16 to the ton in gold. He had some thirty assays made, and as all showed gold, he decided to get capital interested with him, so he took some rock and started to find assistance. He had it tested by a competent assayer, and was surprised and pained to learn that the best of it only showed a slight trace. He sent some to Park City and got the same results, and then realized that the Lehi man had given him false returns, and that he had been wasting time and money in developing a piece of ground that contained absolutely nothing. There should be some means of dealing out justice to such tricksters, for a man who will be guilty of such dastardly work is not fit to be at large.

Death on the Desert.

W. H. La Pearle writes from Bullionville, Nevada, as follows:

"I left Vanderbilt, Cal., 300 miles from here, afoot. Part of the way I came afoot and the rest of the way I walked. I had a jackass packed with a little bacon and flour and a canteen of water and then struck out into the desert. It was a tough trip. I had one tramp of sixty-five miles without water, except my canteen full, and the sun beat down on me redhot for two long days; with not a living thing in sight. I tramped steady for two days and one night, getting across that piece of landscape.

"I had quite an exciting experience the last day when within about six miles of water. I met a crazy prospector. He had his clothes off and was digging holes in the sand for water. When I came towards him he told me to look out, for the water was very deep. The poor chap had been without water for so long that he had gone crazy. I poured a little water out of my canteen for him.

"As soon as he saw the water he jumped on me like a mad dog. As I fell I managed to put my hand on a rock, with which I hit him on the head. He came to in a few minutes and I got some water into his mouth. Soon after he fell asleep. Every few minutes I would pour some water into his mouth, until it was all gone. I had only a pint when I met him.

"I knew it could not be far from water, so I took my pack off the jack and got on him and struck out. In a little over an hour I found the water. I never saw an animal drink like that jack did. I filled my canteen and went back to my crazy man, who was still asleep. I got some more water down him and wet his head. I watched him all night, and I tell you it was a long, dreary night, sitting out on the desert with a crazy man. By morning he had recovered his senses. He told me he had a partner, and they had got lost on the desert. He could not remember where he left his partner.

"After we had had a bite to eat, as he was too weak to go with me, I struck out alone to look for his partner. I found tracks leading right away from the water. I followed them about three miles, when I came to the poor fellow, lying on his back, dead. I dug a hole in the sand and put him in and covered him up as well as I could and went back. My wild man being able to walk a little, we went to the Indian reservation and told the Indian agent about the dead man and then came here and we both went to work."

Outward Bound.

The American and White Star lines have established a $10 rate from New York to Liverpool and Queenstown. The Chicago *Journal* says the news of the cut rates has reached that city and many of the people thrown out of employment by the strike are preparing to take advantage of them. Local steamship agents tell the Anaconda *Review* that a heavy exodus to all parts of Europe has set in. "Times are much better on the other side just now," one of them remarked. "We have sent abroad several thousand miners from Montana and Idaho who have been attracted to the rich gold fields of South Africa, and the stream of travel is all one way now, outward bound."

Pacific Coast Tide Tables.

The tide tables for the Pacific Coast of America, together with statistics in Asia, Australia and islands of the Pacific ocean, for the year 1895, published by the United States Coast and Geodetic Survey, are now ready for issue, and copies can be had for 25 cents at the agencies of the survey in this city, or by addressing the office of the survey at Washington, D. C.

THE quartz mine belonging to Birdsey, Knott & Swinden, Blackwell district, near Gold Hill, Jackson county, Or., was sold to Chapman Bros. of California, for $20,000. The ledge is 3½ feet wide, and shows much free gold. There are 40 tons of picked ore on the dump, which, it is claimed, will assay $50 to the ton. The original company has a lot of rich ore not included in the sale, expected to reach into the thousands when crushed. The purchasers intend to sink 100 feet, and if it preserves its width and richness at that depth they will put up a 10-stamp mill.

A Paying Mine Property.

The Salt Lake and Mercur Railway Co., has been organized with $100,000 capital to build a nine mile broad guage road from Fairfield on the U. P. to the Mercur mine.

As a mining property the Mercur mill and mine is unique. The mine is a great blanket deposit, with a slight dip, and so easily worked through the half-dozen tunnels run in on it as to make the cost of ore extraction almost nominal. Persons who have explored the tunnels and the rooms of a Western coal mine can get an idea of the manner in which this mine is operated, in being so similar, except that up to the present the rooms are lacking, the workings consisting only of tunnels, with parallel drifts, similar in size, and here and there crossents to make air courses, just as in a coal mine. The opening of rooms through extraction of ores will come later, and in time all will be drawn out, the same as are the fillers of coal left in coal mines to support the roof till after the miners have gone as far as desired and are working backward.

There is another difference between this mine and coal mines, in the fact that in the latter there is large waste in the slack and worthless bone, while in the Mercur there is but little waste to cast on the dump.

The ore from the Mercur runs from five to eighteen feet in thickness, is very easily broken down, even in running the six-feet-wide drifts or tunnels, and of course, in what miners term stoping the process of extraction will be still easier. The ore is very silicious, and carries its gold in such minute form as to make extraction of the metal easy under the cyanide process, wherein it is leached in great tanks and the gold deposited by action of zinc shavings.

While the company has prospered ever since they learned how best to extract the gold, they have labored under great difficulties in having to haul ore so far to the mill, and the extra cost of fuel taken by team from the railway up grade. The mill, in June, reduced about 3,000 tons of ore, an average of 100 tons per day. This was the best month's work so far with the mill.

The mill has paid such profit as to allow bi-monthly dividends of $25,000. It is proposed to remodel the mill so as to increase the present capacity of 100 tons per day up to 250 tons. This is to be done in such improved manner as to make the cost of operating not much above what it is now, as far as labor is concerned. The mill is provided with an engine which still has surplus power after the enlargement. Part of the old mill will be torn out and changed by additions to the structure, so as to dump ore into the top and permit it to pass automatically down through the rock-breakers, the rolls and then to ore bins, from which to be drawn into the tanks to be leached. This will do away with the elevators now in use and make the handling of ore much easier and more convenient.

COLONEL NICK TREWEEK yesterday returned from the East, whither he has been in the promotion of an enterprise which if successful means increased thousands for Utah mining properties. That it was the wrong time to place properties, no matter what their merits, however, was not long in dawning upon him after crossing the Mississippi. Threatened derangements in the tariff, discrimination against the white metal and finally the strike, has forced capital into perfect retirement pending the adjustment of these problems, and until they are adjusted there will, says Colonel Treweek, be but little capital coming westward. He takes the situation hopefully, however, and reads in the signs of the times a strong demand next year for Western investments, especially those that have reference to gold mining, placer and lode.—Salt Lake Tribune.

DIVIDEND No. 5 of twenty-five cents a share was recently paid on Silver King mining stock. It aggregated $37,500, or $187,500 to date. The *Tribune* gives as the reason why the King can pay such profits, in view of the low prices of silver and lead, is that the ore is much sought after by the smelters for its high-class fluxing qualities. It also carries considerable gold, and the fact that it is a dry mine lessens the working expenses. While the shaft is being enlarged the output will fall off, but on completion of this work and the other improvements under way the Silver King will be in a position to double its shipments and resume the payment of dividends.

DURING a big storm at Mercur, Utah, two weeks ago W. G. Adamson, a prospector, met with a peculiar experience. He was working in the bottom of a 50-foot shaft when the storm came up, and his partner, who was on top, told him he had better come out. He refused, saying he was better off there than on top. His partner sought shelter in a clump of cedars a short distance off, and soon water, mud and boulders were pouring down the canyon. Soon it began to run into the shaft and Adamson was kept busy treading water, dodging rocks and howling for help. His partner finally heard him and hoisted him out, and before the storm was over the shaft had 20 feet of mud, water and rock in it.

Scientific Progress.

Dust in Nature.

Without dust there would be no blue firmament; the heaven would be blacker than we see it on moonless nights. On this black background the glowing sun would shine out sharply, and the same sharp contrast of intense light and deep shadow would characterize the surface of the earth. There would be nothing to subdue this sharp contrast but the moon and stars, which would remain visible by day. The illumination of the earth would be similar to that which we observe when looking at the moon through a telescope, for the moon has no atmospheric envelope aud consequently no dust iu suspension. It is due entirely to the dust that we enjoy our soft, uniformly diffused daylight, for which our eyes are specially adapted; and it is the dust which contributes so much to the beauty of the landscape. But while the foregoing explains how the dust makes the whole vault of heaven light, it does not explain why it is chiefly the blue rays of the white suulight that are reflected, and only to a small extent the green, yellow and red rays. This is dependent on the size of the dust particles. It is only the finest of them that are borne by the air currents into every stratum of air, and it is only these fine, widely diffused dust particles that are of auy significance in this conuectiou. Now, let us consider the mechanism of light and the extreme shortness of the ether waves which constitute its essence. These waves, although all microscopically small, vary considerably in length. The fine atmospheric dust includes many particles large enough to reflect the short blue ether waves, fewer particles capable of reflecting green and yellow, and still fewer large enough to influence the long red ethereal waves. The red light, consequently, passes through the great majority of the dust particles comparatively unhindered. The blue rays, on the contrary, are intercepted and diffused, and so become visible. This is the reasou that the finest dust—and so, too, the firmament—appears blue.

So, then, the finest dust appears blue. You may observe that the wreath that curls upward from the burning end of a cigar is blue, while the smoke drawn through and exhaled is whitish. The particles in the latter case have uuited and become large enough to reflect white light. So, too, in the country, on a clear day, the sky is blue; but in the city it appears whitish, because of the greater number of coarse dust particles in the air. It is especially on mountain heights that the sky is so intensely blue, because the rarefied atmosphere supports only the finest dust particles. At a great height the sky would be almost black if there were no dust particles in suspension. We see it grow pale as we turn our eyes to the lower strata of air toward the horizon. But why is the sky in Italy and in the tropics so much deeper blue than with us? Is the dust finer there? As a fact, it really is. Not that finer dust rises there, but in our climate the dust particles are soon saturated with water vapor, which makes them coarser. In warmer regions, however, the vapor retains its watery character and does not condense on the floating dust. It is not until the aerial currents have borne it to higher aud colder regions that it is condensed to clouds.

This brings us to the most important role played by dust in our atmosphere; its influence in determining rainfall, due to the fact that vapor fluidifies upon the dust particles. It may be accepted as beyond questiou that of all the water evaporated by the sun from the surface of land and sea, not one drop returns which has not condensed upon a particle of dust as a nucleus. This is easily demonstrated. We fill a large flask with air which has been filtered through cotton waddings until all the original dust is driven out and the flask is full of dustless air. Into this dustless air turn a current of steam from a kettle and you will find it transparent and therefore invisible. Not a trace of the cloudy appearance we associate with steam. The only thing noticeable is that the inner walls of the flask begin to drip; the vapor condenses here as it cools, because there is nothing else for it to condense on. But blow ordinary dust-laden air into the flask and the vapor at once assumes the familiar cloudy appearance due to its condensation on the dust particles, and it begins to rain in the flask. The reason for this is that the vapor condenses on the dust particles and freights them until they sink as rain drops.

Without dust, then, we would have no fog, no clouds, no rain, no snow, no brilliant-hued sunsets, no cerulean sky. The surface of the earth itself, the trees, the houses, along with man and beast, would be the only objects on which the vapor could condense, and these would begin to drip whenever the air was cooled sufficiently. In winter everything would be covered with a crust of ice. Our clothes would become saturated with water condensing upon them. Umbrellas would be of no avail. The vapor-laden atmosphere, moreover, would penetrate to our rooms and condense upou the walls and furniture. In short, the world we live in would be quite another world if there were no dust. Since scientists began to realize the important part played by dust in the economy of nature, measures have been taken to count the particles in a given space. In Loudon and in Paris at the surface a cubic centimeter has been found to contain nearly a quarter of a million particles. On the top of the Eiffel Tower there are about half as many, while in the high Alps there are only about two hundred particles to the centimeter. A great deal of the dust at high altitudes is cosmic dust, consisting, like the meteorites, of carbon and iron.—Die Gartenlaube (Leipzig).

Accidental Inventions.

Some of the most successful and remarkable engineering enterprises have been claimed to owe their existence to circumstances which, when considered in themselves, seem far too trivial to have produced such important results. Though opinions be divided as to the first transmission of power by electricity, for example, it has been strenuously maiutained in some quarters that accident, pure and simple, was the cause of the great discovery, aud an interesting story has been told for many years of the atteuding circumstances. This is to the effect that at the Iuternational Exhibition at Vienna in 1873, the Gramme Compauy exhibited two dynamo machines for plating purposes. One of these machines was in motion, and a workman who noticed that some cables were trailing on the ground, thinking that they belonged to the second machine, placed them in its terminals. To the surprise of everybody this second machine immediately began to turn, and it was then discovered that the first dynamo was driving the second. It would be strauge, indeed, if there were not other versions of this story, and, accordingly, we find several somewhat different accounts, from all of which, however, it would appear that the development of any measurable power in a machiue taking its supply of electricity from a primary dynamo was something wholly unexpected and correspondingly startling.

Closely analogous is the narrative of the origin of one of the most successful foundry blowers now in use, according to which the inventor was attempting to construct a water motor which persistently refused to go round when the water was turned on. In the determination to learn what was wrong, a belt connectiou was made with a line shaft so that the motion of the machine might be studied. By the same means a reverse motion was given to it, and the way in which it threw the water, and, after the water had beeu exhausted, drove a current of air, suggested au entire change of purpose, and the machine was finished aud put on the market as a blower instead of as a water motor, and thousands have been built since. The story, often told, with various modifications of detail, serves as an additional illustration of the fact that inventors frequently stumble upon success in entirely unexpected directions.

The Russell Process.

THE RUSSELL PROCESS CO.,
Park City, Utah.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

DOUBLE-ACTING

Cornish ★ Plunger.

PUMPS TWICE AS MUCH WATER AS THE OLD PLUNGER. Only about one-third the weight of the old Plunger. Special construction of steel for packing on mules, only one-twelfth the weight of the ordinary Plunger. First outlay one-third less; works with 10 per cent less power.

IMPROVED SINKING PUMP.—Bucket and clack changed under water. Bucket lasts six times as long as the old one, saving expense of putting down another pump where bucket and clack cannot be changed under water. The self-tightening and self-lubricating stuffing box and new bucket also saves expense of dropping extra pumps. WM. NANCE, Grass Valley, Nevada County, California.

Mechanical Progress.

New Electric Locomotive.

There is an electric locomotive in course of construction in Boston, which promises to meet all the requirements for propelling railroad trains. It is an eight-horse power machine, and it is unique. The distinctive feature of the invention is the substitution of a piston and cylinder in place of the usual rotary motor for the application of power. The cylinder is much lower than for steam purposes, and has in its interior a series of magnets. The piston passes entirely through the cylinder, with crossheads at either end. On the piston within the cylinder is a series of armatures of peculiar construction. On the axle of the driving wheels are commutators, whose functiou is to apply and cut off the electric current, just as the eccentrics control the steam of a steam engine. The principle of the machine is the admission of the currents to the maguets in the cylinder, which are in advance of the piston rod, and by their action on the armatures the piston rod is moved forward. As the stroke is ended the current is cut off from the magnets first charged and applied to those at the rear of the piston, giving it a reverse motion, thus maintaining a strong, regular motion. There is absolutely no back pressure from the electric current, while in a rotary motor this is estimated at twenty per cent of the force applied. It is practicable to run the machine at 200 revolutions of the axles per minute, and with a driving wheel eight and one-half feet in diameter and the crank-pin three feet from the center there would be a six-foot stroke under a full head of power. The machine is adapted to receive the electric current either by a trolley wire, a third rail in the track or from a storage battery.

THE vast engineering enterprise now being carried out for the utilization of a part of the energy of Niagara has stimulated attention to the subject of water powers all over the country. Many of them are being quietly bought up and others are very freely discussed, while on a third class heavy expenditures are already being made. One of the most ambitious of these projects is that for which a big dam has been thrown across the Colorado river, near Austin, Texas, by municipal funds, and which ouly depends for its completion on the raising of the full $1,500,000 voted by the citizens. This dam is of solid granite and limestone masonry, 1150 feet long, 66 feet wide at the base, 18 feet wide at the top, and 6 feet high above low water. By its meaus the river at this point has beeu turned into a lake 30 miles long, in places 2 miles wide. It is estimated that 100,000-horse power can be furnished wheu the plant is ready, aud one mildly wonders what Austin, a city of but 25,000 people, is going to do with so much, unless it should attract manufacturing industries from all over the South by its cheap power.

THE lapse of the Edisou incandescent lamp patents in Europe has had the effect of bringing so many new, cheap and bad lamps on the market that all the manufacturers there are agitated. These patents and those ou the telephone have beeu the only electrical ones that have beeu sustained by the courts, aud uow that they have run out the temptatiou to enter the field appears to have overcome commou prudence; hence incandescent lamps have sold in London at fourteen cents apiece. The lowest price in New York is at least twice as much, aud is admitted by experts to be fair. A union is now being formed at Berlin to which all the leading lamp manufacturers of Europe have given their adhesion, which will probably prevent further cutting. The price is likely to be about that which now prevails in America. The complaint is made that fixing the price is a small matter compared with fixing the voltage. Instead of a few standard voltages being in existence, there are literally scores, all of which complicate matters, it is said, and add greatly to the cost of production. The point is made that in Europe, or at least in England, the unit of illumination for a lamp is ten-candle power, whereas in America the unit is sixteen-candle power—another instance, it is alleged, of American extravagance and abseuce of economy.

BUT one of the two mangauese mines in California was in operation in 1893, the one near Alameda, in Alameda county, which produced 400 tons carrying about sixty-five per cent of binoxide, the value at the mines being $2000. As has heretofore been stated, there is but a small demand for manganese ores on the Pacific coast, chiefly for use in the manufacture of chlorine gas to be used in workiug sulphuret gold ores. The total amount of mangauese produced in California up to the close of 1890 is estimated to be between 6000 and 6500 tons. This estimate is made on the basis that 5000 tons was mined for shipment to England from 1867 to 1874. After 1874 only small amounts were produced each year, none being produced in 1892, and in 1893, as stated above, the product was 400 tons.—J. D. Weeks in Mineral Resources for '93.

M. MOISSAN recently described a reverberatory electric furnace, the esseutials of which are a block of limestone hollowed out and lined with plates of magnesia and carbon, the carbon being the inside lining. A lid of like structure covers in the cavity. Electrodes pass through slots cut in each side of the block, and square with them is a tube of carbon from one-half to oue inch in diameter. The arc passes about one-half inch above the tube, and, by tilting it, the reducible material can be passed through from the high to the low end, and the furnace thus made to work continuously. M. Moissan obtained two kilograms of chromium iu an hour with 600 amperes and 60 volts.

A NEW YORK INVENTOR has introduced a new method of keeping up the incandescence of electric glow lamps. The current is not contiuuous, but is divided up, as cyclostyle writing is divided into dots. The lamp has no time to cool down when the current comes through it; but in the meantime the current has, in the same manner, been supplying other lamps on another circuit. By means of a rotating commutator at the central station, the nccessary switching on and off is, we understaud, accomplished at the rate of about seveuty times a second.

THE following is a description of the Bernardos process of electric welding: The article to be operated upon is connected to one terminal of the dynamo, while the other terminal is a carbon rod, the movements of which are controlled by the workman. By this an arc is formed between the metal and the carbon pencil, and this latter becomes the equivalent of an electric blowpipe, fusing the metal, melting together seams, and even cutting out sheet metal into patterns.

IT has been shown by recent experiments that there is practically uo difference in cost between cooking by electricity and by coal, while the advantages of the former method in point of comfort, cleanliness and safety are considerable. Of every 100 tons of coal burned in an ordinary cooking stove ninety-six tons are, it is said, practically wasted, whereas with electricity the expeuse is not so much on the fuel as on labor and interest on machinery.

THE Western Union Telegraph Company has absorbed the American Rapid Telegraph Company and increased its capital stock 5500 shares in payment for the same. The property of the American Rapid Telegraph Company consisted of 2684 miles of poles and 20,370 miles of wire, extending from New York City to Boston, Buffalo, Cleveland, Pittsburg, Chicago, Washington and intermediate points, with office equipments and rights of way.

Educational.

INSTRUCTION BY MAIL

In ARCHITECTURE; ARCHITECTURAL DRAWING; PLUMBING, HEATING and VENTILATION; BRIDGE ENGINEERING; RAILROAD ENGINEERING; SURVEYING and MAPPING; ELECTRICAL ENGINEERING; MECHANICAL DRAWING; MECHANICS; ENGLISH BRANCHES, and

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL NOTES—*Ledger:* R. H. Browning of El Dorado springs, Missouri, has purchased one half of the stock held by Chas. Peters in the Good Hope Mine. The contract is that the mine will be opened in thirty days.

The Hancock company will be incorporated in a short time. The people who recently purchased the property from C. O. Mitchell of Sutter Creek have already ordered a 20-stamp mill from the Risdon Iron Works, and extensive supplies from San Francisco. The entire apparatus for working the property will be on the ground inside of 30 days. This property has a ledge exposed for 2000 feet which is 20 feet wide, and the croppings of which will show gold at any point. Miners who are familiar with the property consider the prospects good for a large mine.

Messrs. Cross and Poundstone spent a part of the week at the Gover mine in conversation with those interested in the attachments upon the Gover. Mr. Cross represents the Hobart estate which is interested with Haywards and Lane in the Utica and other mining ventures. These people desired to allow the balances in the hands of the sheriff from the clean ups he has made on the property, after the sheriff's fees are paid to go pro rata to the payment of labor claims; they to take the mine on a ninety day trial, and if satisfactory to take the property and pay the balance of the labor claims out of the earnings of the mine. If the miners consent to the arrangement the property will be placed in charge of Mr. Poundstone as superintendent and work will he resumed immediately.

The mill on the Maximilian mine about one mile east of Sutter Creek will be in a condition to start up in a few days. This is the property of John Bernardis, who brought a three-stamp battery from Jesus Maria and erected it on the property. The mill was made at the Donnelly foundry, being about the last work turned out by that concern, and has been used but a short time. The power will he secured from the Blue Lakes Water Company's ditch, a line of pipe 300 feet long, giving a fall of 750 feet. A 31-inch wheel will furnish the power. The tunnel is 40 feet in on the ledge and is supplied with tracks and car. The construction of a 300-foot ditch is all that is necessary to have everything in running order. Before going to the expense of putting up the mill Mr. Bernardis made a mill test of 50 tons of rock at the Belmont which was more than satisfactory.

THE GOOD HOPE MINE—*Dispatch:* Charles Peters has sold one half of his interest, or 24,500 shares, in the Good Hope Mine to R. H. Browning, and the probabilities are that the work of developing the mine will soon begin. The Good Hope is situated between the Kennedy and Zeile mines, both of which are now paying good dividends, and there is every reason to believe that this will also prove to he a valuable property when it is fully developed.

El Dorado.

GRIZZLY FLATS.—Cor. *Democrat:* Machinery is heing placed on Rocky Bar for the purpose of working a big bed of gravel known to exist there, hut which has been neglected from the fact that it required a little capital to put up suitable pumping and hoisting machinery.

The Mouse Gulch mine, which has heen idle for many years, is now attracting considerable attention, as good milling ore is being taken out.

The Eagle King is being worked, and shows a large vein of good ore.

The Melton mine is waiting for machinery delayed hy the tie-up on the railroads.

Will Murdock and others are opening a har of gravel on the North Fork of the Cosumnes river, which is promising well.

Cap's Crossing, a few miles from here on the North Fork, is attracting the attention of prospectors. Several nuggets of gold have been found in a ravine on the side of the river recently, weighing as much as $126.

Nevada.

OSBORN HILL.—*Telegraph:* The Osborn Hill mine is building a 20-stamp mill. The ledge is looking well. A force of men is at work.

At the Conlon mine the shaft is being put down rapidly. It is now about 300 feet.

There has been a great deal of work done at the Daisy Hill within a very short time. The machinery is all on the ground and will be at work. The shaft is on an angle of 42 degrees, and is now 100 feet deep. It is tapped at the hottom hy a perpendieular shaft 83 feet in depth.

Placer.

ALTA.—San Francisco parties are operating the Cedar Creek gravel mining claim at Shady Run. It is the same as the Damascus lead. A. Rodger is superintendent. It is principally fine gold, and pure, averaging $19.20 to the ounce. Mr. Rodger unearthed one of the largest nuggets ever found in that section, when, some years ago, he found one at Iowa Hill valued at $1250.

Plumas.

PLUMAS IMPERIAL MINE.—*National-Bulletin:* Water hecoming exhausted, the Plumas Imperial hydraulic mine has closed down for the season. Washing was suspended and the hedrock and sluices cleaned up. The yield of gold was satisfaetory, demonstrating that the mine is a valuable piece of property. The company had an immense amount of work to do the last spring, and did uot get to washing gravel until the water season was nearly over. However, a large gravel channel was opened up, containing much coarse gold, as well as a good yield of the finer quality. The compauy owns a large area of mining ground, 1200 acres in all—900 on Hungarian Hill and 300 at Emigrant Hill—embracing extensive and valuahle gravel deposits, and constituting one of the best hydraulic propositions in this part of the State.

During the past year the corporation did much work in fitting up this mine for operation. Connected with it are 16 miles of ditches and flumes, a reservoir at Dean's Valley, and nearly 5000 feet of large pipe, all for the purpose of delivering a big supply of water at the mine.

The restraining works erected near the confluence of Rock creek with Spanish creek are the best to he found in northern California. A large stone dam huilt across a narrow gorge, the sides of which are solid rock, form a deep settling reservoir nearly half a mile long. With practically dead water for that distance, it is impossible for any debris of a hurtful character to pass the dam. The impounding of debris is most complete, thus enabling the company to operate their mine without the slightest harm to the navigable streams in Sacramento valley or to the farming lands in American valley.

Siskiyou.

MINING NOTES.—Yreka *Journal:* The companies at work in the Benz Bar and Fort Jones claims are washing pay gravel. Nearly all the other companies have been washing for three weeks with good success. The river is down to its summer stage. Miners will rush work day and night in most of the claims until the winter storms set in again next Decemher.

The Orr quartz mill on Humbug creek has been kept running steadily for some time lately on good paying quartz.

FROM SALMON RIVER.—A correspondent, under date of July 16th, says James Murphy and John Freelaud have discovered a rich gold mine on White's Gulch, the ledge heing from four to six feet in width, and the ore estimated at $50 to $75 per ton.

Smith and Marion are working their mine on White's Gulch, and are taking out rich ore.

The Golden and Frank mine is running in full blast and paying well.

The Jumbo Co. have started up their mine with a full crew, and taking out good ore.

The Gold Nugget gravel mine has been shut down, water being scarce.

OREGON.

ROGUE RIVER NAVIGATED. — Grauts Pass *Courier:* H. B. Moore of Curry county came up Rogue river in a boat for supplies for their ranch, a distance of eighty miles, consuming forty hours on the trip. Their boat was twenty-four feet long and they were obliged to "line up" over rapids and falls for a distance of teu miles.

They prospected along the banks with pick and pan and anybody can find diggings where fifty cents to a dollar a day can be made with a rocker. The best prospects they struck were down the stream about sixty miles.

They took about 700 pounds of provisions on their down trip and claim that the stream could be made navigable for small boats at very small expense, and that the government could by blasting and locks make Grants Pass accessihle for steamers of good size, even when the water is low.

THE BUFFALO BONDED.—Baker City *Democrat:* A mining deal of considerable magnitude was transacted in Pendleton Saturday, wherehy the Buffalo property in the Granite district was bonded to W. T. Mendenhall of Chicago for $30,000. The deed was placed in escrow at the Pendleton Savings Bank, Mr. Mendenhall having an 18-months limit. The Pendleton parties who own the property are Lot Livermore, S. Rothchild, John E. Bean, C. S. Jackson, Cox & Minor, Thomas W. Downing, William M. Beagle and Harry Dickson.

The property is a quartz formation carrying both gold and silver. The mine is well developed, over 80 feet of tunnels having been run. Mr. Mendenhall will study the character of the ore and decide whether to erect a stamp mill or put up a smelter. He will remain at the property, which is located about 50 miles west of Baker City and 100 miles south of Pendleton, for a month or so, then return to Chicago, and later in the fall will make a trip to Germany.

LONG CREEK.—There is much prospecting going on all through the Long creek section. Many prospectors are going in, more than ever hefore. Sloan & Haskell, Smver and others are doing lots of work. The first mentioned firm recently took out a $487 nugget, and several smaller ones have been found. They have cleaned up $8000 thus far this season. At Brown's mine in Fox valley the output has been this year $10,000. A mill, the Black Butte, is running with ten stamps. The capacity will he increased unless a sale is consummated, which is now being negotiated. The consideration is to be $100,000 for the mill and quartz mine.

WASHINGTON.

A mill run has been made at the Golden on ore from the Triune, in the Okanogan country, saving $15.25 gold to the tou. This is a profit of $10 in excess of the expense of mining and milling.

IDAHO.

IN THE CŒUR D'ALENES—*Miner:* We have no desire to exaggerate the condition here in the Cœur d'Alenes. The plain statement of the facts is sufficient to convince any one that the ordinary civil officers, it matters not how fearless and determined, are powerless to cope with the criminals that infest the country and to protect life and property. Threats and intimidations, coupled with an inordinate desire to make money, have so suhdued public sentiment, which in most sections can be depended upon to support the officers in enforcing the law, until to denounce crime is to invite a hoycott or worse from the element that dominates the country and encourages and protects the criminals. The people of the Cœur d'Alenes are entitled to protection in every right of American citizenship, and the past has certainly furuished sufficient proof that this can only he secured by the presence of United States troops. Steps should be taken at once to establish a permanent post here. This would at once restore and maintain peace.

A PROMISING SECTION.—Boise *Democrat:* The next important quartz-mining district opened will undoubtedly he that of the Half Way House, on the Idaho City road. That point is the radius of a network of gold and silver-bearing ledges, unequaled in extent and value by any camp in the State. Mineral helts, with porphyry and granite formations, rib the hills and mountains everywhere, while water power and timber supplies are at hand. A considerable numher of locations have been made, but development work has progressed slowly for want of means hy the parties holding them. Recently men of experience and able to command unlimited capital have visited and examined some of the prospects.

NOT ENCOURAGING THERE.—Hailey *News-Miner:* G. A. Williams, superintendent of the Atlanta Gold and Silver Mining Co., arrived yesterday from Atlanta. He is now working twenty-one men, and says there are fifteen or twenty more already in that camp looking for work. He advises no workingmen to go to Atlanta for they will be disappointed. He is clearing out a 1400-foct tunnel which has been lying unused for twelve years and which is badly caved—at least as far as he has gone in it, some 200 feet.

MONTANA.

DEER LODGE GOLD MINES.—"The gold production of Deer Lodge county for the year 1894 will exceed that of the past eight years." This statement is made to the Anaconda *Recorder.* The Bald Butte mine is making a profit of $1000 a day. This mine employs fifty men, and has a complete reduction plaut. The Granite Butte, northwest of the Bald Butte, is making a profit of $300 a day for its owners, and employs twenty-two men. At the Cumberland mine a Crawford mill of ten stamps' capacity will be started up next week. The Royal mine will he producing again by Aug. 1st. Placer mining in the county is very active. A great many men are at work in Pioneer, Rock Creek, Ophir, American, California and Washington gulches. A miner named James O'Donnell worked a claim near Champion thirteen days recently and took ont 157 ounces in gold, for which he received $18 an ounce.

A RARE METAL.—S. C. Beebe, in Anaconda, gives the *Railway Review* some interesting facts about a mine recently discovered in the district about twenty miles west of Bannock. The ore of which he speaks is a free-gold quartz, mining from $12 to $20 per ton in the yellow metal. The chief valne of the ore, however, is thought to depend in the metal validium which it carries in large quantities. This metal is worth $1800 a pound, and is of value for coloring. It occurs in small seven-sided crystals, about the size of grains of wheat, and of a pinkish brown color. The specific gravity of the metal is about the same as that of lead. It concentrates readily and three tons of ore have been already run through a concentrator with very favorable results. The ore also carries chloride of lead, bnt not a trace of silver.

Mr. Beebe states that abont $4000 worth of work has already been done on the claim, and the deepest workings are about fifty feet. The vein is a contact formation between quartzite and porphyry, and is about four feet from wall to wall. It is owned hy Mr. Taylor.

So far as known, this metal does not occur anywhere else in the United States. Its treatment so for as this country is concerned would consist merely of concentration, the concentrates being shipped to Swansea, Wales.

BOSTON & MONTANA—This company is better off in regard to material than any other in Butte. Since the operation of the smelter at Great Falls and the shutting down of the smelting works the company uses practically no coal. This company is operating both the Colusas, the Mountain iVew and the Pennsylvania. These great properties give employment to about 700 miners and produce the outut requipred of them with the steadiness of clockwork. The two Colusas are worked principally through the Leonard shaft, which is the largest in the camp. This shaft is eighteen feet eight inches by six feet six inches, and consists of two working shafts four and one-half by four feet in the clear, and a pump compartment four and one-half by seven. It is now 600 feet deep. The smelter at Great Falls is running as usual.

The Butte & Boston is making about 2,000,000 pounds of copper per month and is being operated in a most progressive and energetic manner. Its smelter is principally supplied hy the East Gray Rock and Silver Bow mines. The shaft at the East Gray Rock is now below the 1300-foot level, and sinking is still in progress. This mine is magnificently equipped, and sinking will continue until the 2000-foot level is reached.

THE PENOBSCOT SOLD.—*Inter-Mountain:* The latest important transaction is the sale of the Penohscot mine, north of Helena. The purchasers are New York and Denver capitalists, and the consideration is $125,000. The first payment of $25,000 was made to J. Henry Longmaid, the former owner of the property, and the new proprietors will take possession at once.

The Penobscot is a gold mine and the ore is free milling. It is in the same helt with the Drum Lummon, Bald Butte and other famous gold producers.

THE SUNRISE MINE.—The Phillipsburg *Mail* reports the uew twenty-stamp mill is in operation. The mine is located in Henderson gulch about two miles above the old placer diggings, where thousands of dollars were taken out years ago, and it is now conceded that Henderson mountain and its tributaries furnished the gold for the old diggings that enriched so many pioneer fortune seekers. It is stocked for 500,000 shares.

Several other prospects are under way of development in the vicinity of the Sunrise, and most of them have reasonably good indications for developing into mines. Among the most promising is the Healey property, on the opposite side ol the gulch one mile below the Sunrise.

ROYAL GOLD.—Phillipsburg *Mail:* This mine is northeast of Phillipsburg. The property was originally located by Messrs. Smiley and Swain, two prospectors, who succeeded in getting Willard Bennett and W. W. Turney interested in the property. They were soon convinced of the richness of the property and a deal was consummated with the owners in 1891 whereby they received $13,000 for all their right and title in the Royal Gold. Mr. Turney managed the operations on the property for some time after that, and with a small Huntington mill in use he took out considerable gold and made developments sufficient to warrant operations on a more extensive plan, and last year a ten-stamp mill was huilt. In the meantime Mr. Turney had disposed of all his interest in the property to Willard and Nelson Bennett and Conrad Kohrs, receiving a total of $50,000 therefor.

Willard Bennett then took charge of operations, and to him is largely due the success of the mine up to the present time. He blazed the first trail into the place, and his unfailing confidence in the mine and his willingness to expend money in its development has made it what it now is. When Mr. Bennett took the management the property owed him $40,000, and in less thau nine months' run with ten stamps he had paid off the debt and made the stockholders richer by $70,000 in dividends.

The mill is not now in operation, as the flow of surface water into the tunnel lately has prevented the extraction of ore. The water is slowly receding, however, and thirty men are now engaged in one way or another in preparations to start the mill at the earliest possible time.

The development thus far made consists of 3000 feet of tunnels and drifts, at least one-half of which has heen or is now in ore. It is estimated that at least a half million dollars is now in sight, and as greater depth is attained the vein becomes stronger and richer.

Everything about the place in the way of permanent improvements shows good management and arrangements for economic operations. A tram road of 1000 feet is built from the upper tunnel to the mill, which is operated by gravitation and the ore is conveyed by it at a cost of less than three cents per ton. The superintendent is now planning to run the mill with water power, which can be done about eight months in each year, and that will prove a big saving.

SOUTH DAKOTA.

BIG HORN MOUNTAINS.—The formation of the mountains is entirely different from that of the Black Hills, showing very little indications of the presence of gold or silver. Copper, however, abounds, though so far the ledges found are too narrow to pay for development, though some of the ore assays as high as forty-five per cent copper. At the Bald Mountain placer country, near Buffalo, which attracted so much attention last year, there is some gold, but not enough to pay: one company, with a $75,000 plant, is barely making expenses. The gold-bearing district is limited. Bald Mountain being a cement deposit, apparently formed before the upheaval of the surrounding mountains.

AT THE GOLDEN REWARD.—Deadwood *Pioneer:* Harris Franklin has gone to Chicago to purchase the requisite machinery for the 100-ton cyanide works which the company are going to build next to the Goldeu Reward chlorination plant.

At Puma the cyanide mill is running steadily on concentrates recovered by the Rice concentrator from Homestake tailings.

THE BLACK HILLS.—The owners of the Little American mine of Rainy Lake City got 27 ounces of free gold and a quantity of rich concentrates, the product of one and a half day's work with the stamp mill of the Little American. The free gold, alone valued at $499, came from 30 tons of ore. The Rainy Lake mill is now running night and day and the number of stamps will be douhled at once, and a new mill also put up. The vein on the Little American is 17 feet wide and widening.

UTAH.

Park District.

THE SILVER KING.—*Record:* About thirty men were laid off at the Silver King mine Saturday last and the work of enlarging the shaft to two compartments and a manway is now in full swing, and it is expected to have the same completed within 90 days. The shaft from the 700 level down is of the required size, hut from there up will have to he enlarged and retimbered. Surface water has ceased to trouhle and the work will he prosecuted without inconvenience from that source. The enlargement of the shaft, however, is not the only improvemeut to be made by the owners of that property, for it has heen determined to put in first-class machine shops, an air compressor and rock drills, and thus place the property on an equal footing with all the hig mines in the camp. The shops and the work of erecting the huilding has already commenced; will be equipped with a complete set of the latest improved tools, comprising a lathe, planer, drill press, patent forges, a 25-horse power engine and a duplex air compressor—in fact, everything necessary to enahle the company to do its own repairing, make needed improvements and facilitate rapid and economical work in all parts of the mine. When the improvements under way and in contemplation are completed the Silver King will he second to no other property in the camp, and the fact that last month, with a single compartment shaft and a depressed market, the property paid a dividend of 25

cents a share, or $37,500, shows that it is a big mine now, but it is going to get bigger as the years roll around, and with silver at $1 per ounce it would be a mighty lever in making the fame of Park City world wide.

A PECULIAR FEATURE.—S. L. *Tribune:* A number of Provo citizens have been to the Uintah country and located claims. There is one peculiar feature connected with the new district that is causing a great deal of comment, and the impression is prevalent among those best qualified to judge that before long something sensational will be made public. Of the very many samples brought in for assay, none have contained more than from $1 to $2, and in many cases not more than a trace, except those taken from the Dead Man claim, although apparently the same class of rock and taken from the same vein. The money to be paid Mr. Whittemore for his interest in the mines discovered by Hatch and Holladay has not yet been paid over, as was reported in a local paper some time ago.

BINGHAM DISTRICT.—The long Butterfield tunnel continues to be pushed ahead at an encouraging rate. It has thus far cut through four bodies of ore.

The new shaft on the West Mountain Placer Mining & Milling Company's property is down to water, and as the work cannot progress further without the aid of machinery, the men were laid off until the pumps, boilers, etc., arrive.

The Alice mine, which is being operated by Salt Lake parties, is attracting attention. A long tunnel is being run to tap the ore body. The tunnel starts on the Levant ground and runs through the J. C., Miners' Home, Alice No. 2 and Washington properties. Five hundred feet farther will have to be driven before the objective point is reached. The Alice is located on the same vein as the Highland Boy.

COLORADO.

San Juan District.

RICH ORE.—*Republican:* Samuel G. Beatty and M. Landa, of Silverton, came in yesterday with a carload of eight tons of ore from the Golden Fleece Mine and are at the Oxford.

The ore is of great richness and will probably average $2,500 to the ton. It will be sold to the Colorado Sampling Works.

"We folks in the San Juan District," said Mr. Beatty, "have just about gotten tired of waiting for an improvement in the market for silver, and have concluded to ship our ores to the best possible advantage. I am interested in a number of silver properties, also in mines which run heavily in galena ore, but gold is the only thing which it will pay us to mine now.

"The Golden Fleece mine is one of the richest in the district, and already shows signs of fine development. We have not done any stoping yet, but in the chute we have run, have discovered some remarkably rich ore. Samples have run as high as $79,000 to the ton, but of course these were exceptionally rich specimens.

"The mining men of the San Juan have about waked up from their condition of lassitude of the past few months and concluded that nothing could be gained by inactivity, notwithstanding the low price of silver. They are putting on new energy and going to work vigorously to develop their mines, satisfied that low profits are preferable to idle mines. They also realize that silver has nothing to hope for in the near future, and are seeking new mines of gold, copper, lead and iron, with all of which the district abounds."

ARIZONA.

ON THE AGUA FRIA.—*Courier:* Some months ago excitement was created by a lot of rich gold rock being brought in from the Moscow mining group, on the Agua Fria. The ore was free milling and when broken open the gold dropped from the honeycombs, covering the places where the rock was broken with glittering flakes of gold. At that time the owners were offered $100,000 for the mine, but, owing to some disagreement, nothing was done with the property then; since, work has been pushed and a large body of much richer ore struck. There are seven claims in the group. The owners will work the ore at a custom mill. This mill will be run by water power and the Moscow ore will be worked at a cost not to exceed $3.50 per ton.

WORKING DAY AND NIGHT.—*Journal-Miner:* The editor of the *Journal-Miner* visited the Lynx creek hydraulic works a few days since, and found the steam dredge and amalgamator working very satisfactorily to T. G. Barlow-Massicks, superintendent and general manager of the works. Mr. Massicks is running two shifts of ten hours each per day, and is putting through close on to 1,000 yards of gravel per day. The machine at work now differs very materially from the original machine sent out, in fact, but little of the original machine is left. The company which furnished it succeded in furnishing an excellent suggestion, by their machine, and Mr. Massicks has succeeded most admirably in working out the suggestion into a good practical machine for handling placer gravel and saving the gold in it, with a very small amount of water. The machine contains two principal features. First, the gravel is taken from the banks by means of a dredge, operated by steam; and the second is the amalgamating tank. The gravel is carried up in the dredge buckets and emptied into an immense steel cylinder, which constantly revolves, and which is provided with three sets of screens. As the gravel enters this, it is washed by means of water jets, and the washing process continues after it reaches the cylinder, and until it is discharged on an endless belt, provided with huckets similar, in principal, to an elevator, by which the debris is carried to one side, out of the way of the machine. The finer gravel and gold is carried to the large tank beneath the cylinder, where the gold is caught on plates. The whole thing is managed by five men, the machine being arranged so that everything is done by steam. It requires only three miner's inches of water to operate it, and this water, when used, flows back into the reservoir and is again pumped up into the machine, and is used again and again, the loss being comparatively small.

Red Rover District.

AN IMMENSE BODY OF ORE.—*Gazette:* Dr. G. W. Stimpson has returned from the Red Rover district, where he has had men at work on the Ruby mine. This is a property discovered years ago, but for its inaccessibility and distance from water the discoverers were unable to work it without the aid of capital.

The deposit is an immense iron dyke, in some places 400 feet in width, with croppings rich in gold, copper and silver. It is distant one and a quarter miles from the old Red Rover, which was without donht a chimney from this great mass of ore. The work of the past few weeks has resulted in a wide, roomy tunnel, 100 feet in length, and by driving 85 feet farther the ore body will bo cut 400 feet below the croppings.

NEW MEXICO.

SOLD FOR $75,000.—*Liberal:* P. H. McDermott of Carlisle has sold the Laura and Clara mines to the El Paso Smelting Co. for $75,000. There are three shafts on these properties, one fifty, one fifty-six and one a hundred and thirty-five feet deep. There are several hundred feet of drifts. No ore has been stoped. The ore runs nearly equal in value with gold and silver.

THE CONFIDENCE MINE.—Silver City *Enterprise:* In making the upraises to start the stopes the following results are shown: An average sample taken from upraise No. 1, ore body seven feet in width, gave 1.82 oz., $36.40, gold and 74.2 oz. silver, at 60 cents per oz. for silver $44.52, a total of $80.92 per ton. Another average sample from the samo upraise gave 1.20 oz., $24, gold and 81 oz., $48.60, silver; total $72.60 per ton. Upraise No. 2, ore body eight feet in width, gave 1.86 oz., $37.20, gold and 130.2 oz., $78.12, silver; total, $115.32. The lowest average obtained from these upraises during this work has been .75 oz., $15, gold and 50.7 oz., $30.42, silver, or a total of $45.42 gold and silver.

The mill is approaching completion as fast as men and means can accomplish it. The ore bins at the mill have about 700 tons in them and will soon he filled to their utmost capacity, about 1800 tons. At the mine upraises have been started at 900 and 1000 feet from month of tunnel, and stull timbers are being put in place to start stopes from. Two other upraises will also be started immediately, one at 400 feet from the month of the tunnel and one at 1100 feet. The whole of the ground along the entire length of tunnel will he blocked out for stoping as necessity for ore requires.

The mill and mine will be lighted by electricity. A telephone liue will be run from the mine to the mill. The poles for the telephone and electric light lines are heing strung along the route between the mine and mill. The pipe line trestle work is nearly completed, and the 7000 feet of five-inch pipe to supply the mill with water will soon he put in place. A larger pipe-line to carry water power to run the mill is contemplated; for the present the machinery will he run by steam.

NOTICE OF ASSESSMENT.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, Cal.; location of works, Virginia, Storey county, Nev.

Notice is hereby given that at a meeting of the board of directors, held on the 27th day of July, 1894, an assessment, No. 74, of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, room 69, Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of August, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 21st day of September, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the board of directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada block, 309 Montgomery street, San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Philip Hayes in the Hayes & Steelman Mine near Gold Lake, Sierra Co., to deposit tailings on a flat in Mohawk Valley; from Stephen Soracco in the Mohawk Mine near Johnsville, Plumas Co., to deposit tailings behind log and brush dam in a ravine; from Frank F. Vanzlui in the William Tell Mine near Johnsville, Plumas Co., to deposit tailings behind log and brush dam in Yankee Ravine; from Nicola Rossi and Peter Lorenzo in the Grizzly Bear and Garfield Flat Mines near Johnsville, Plumas Co., to deposit tailings behind dams in Squirrel Creek; from Reagan and Lowe in the Howard Mine near Ono, Shasta Co., to deposit tailings behind brush dams in a ravine; from T. H. Steel in the Steel & Co's Mine near Brownsville, Yuba Co., to deposit tailings behind stone dam on New York Flat; and from the Consolidated Amador Volcano Hydraulic Gold Mining and Land Co. of California in the China Hill and Elephant claims, to deposit tailings in Sutter Creek; gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., on Monday, August 13th, 1894, at 1:30 P. M.

CASCADE WATER WHEEL

EMBODYING IN PRINCIPLE, THE

HURDY-GURDY or IMPULSE WHEEL.

ADAPTED TO ALL HEADS,

FROM 30 FEET TO 2000 FEET.

Our experience of 33 YEARS in the water wheel business enables us to suit every requirement of Water Power Plants. Send for Illustrated Pamphlet.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 22 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies. Stamp Cam.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Selby Smelting and Lead Company,

416 Montgomery Street, San Francisco.

Gold and Silver Refinery

—AND—

Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of

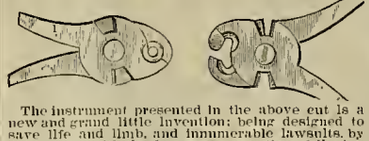
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

Also Manufacturers of

STANDARD SHOT-GUN CARTRIDGES,

Under Chamberlin Patent.

GIANT POWDER FUSE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

MOODEY & SHERWOOD, Fresno, Cal.

(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞Extra sizes and lengths made to order on short notice.

611 and 613 FRONT ST., San Francisco, Cal.

Electrical Progress.

The Coming Electric Light.

A writer on the electric light says we are on the eve of a revolutiou in electrical science that seems destined to make of light not beauty's citadel merely, but the hestower of beauty itself. Without light heauty would cease to he evident. No wonder, then, that light has become the Nile of physics, with scientists seeking night and day for its ultimate source. The secret seems to have heen learned at last, and scieuce is now the land of the uusetting sun.

Imagine au ever-playing fountaiu of light or a century plant in uneudiug bloom, of which the petals are sheafs of light. There is no graceful dream too extravagaut iu this respect for realization now. The chaudelier, the globe, the bulb, the paiuful mechanism which has made the counection of light and machinery so unæsthetically obvious heretofore—all are destined to be swept away. Light iu the next century will well impalpably out of walls. It will stream from hrackets or picture frames, noue divining from wheuce it comes, like the perfumes of Lucullan hanquets.

Nicola Tesla predicts the results of the discovery that has beeu made. "The one impediment," he says, "is cost. That problem will he solved yet —perhaps in three mouths, perhaps not iu as many years. The existing waste in electric lightiug is barbarous—barharous. Ninety per cent of the material employed goes for nothing. But when we have settled the question of cost the uew era will dawn. Light will become really a great transforming factor in civilization. It will then he uot only day, but a glorious, heautiful day."

It may he mentioued at this point that to D. McFarlau Moore, the American electrician, who has done as much to popularize the use of electric light as any living man, probably, helongs the credit of having first called the attention of scieutists to the impeuding chauge. Tesla has indeed been experimeutiug for years, and long ago indicated the lines along which the trausformation would be wrought. Mr. Moore, however, demonstrated why the uear future will wituess the commercial adoption of the trausmissiou of light through tubes, aud that electricity is to be the ageut of this consummatiou. It is declared hy scientists that while the conversion of heat into power aud power again iuto the current kuown as electricity, seems to have reached a limit for the present at least, the matter of producing light from electricity has hardly hegun to be studied.

The incandescent lamp is admittedly the illuminant of to-day. In spite of its conceded advantages, however, the scientific world has come to look upon it as a crude contrivauce for reasons apart from the humiliating circumstance that to extract five per cent of light 95 per cent of the constituent elements goes to utter waste. Therefore, iu spite of the practical elimination of the factors of heat and odor from the prohlem of dispelling darkness, scientists have for years beeu at work in an endeavor uot so much to make new discoveries as to utilize discoveries already made.

Now, what is known as phosphorescent, or glow lighting, has come to be recognized as the source of untold millions to the capitalist who can first reduce it to a marketable commodity in the cities of the world. So far the great cost attending its utilization has stood in the way of any such enterprise. Mr. Moore makes the assertion, iu *Cassier's Magazine*, that electric sparks rapidly succeeding one another in a vacuum are the key to the whole treasure house. This fact is shown hy means of au ingenious contrivance now familiar to most electricians, in which the currcut of electricity is repeatedly broken hy rapid vibratious. The vibrations produce a correspondiug number of sparks which act upon the ether iu a bulb duly placed to be affected in precisely this manner, with the result that the whole bulh gives forth light. Such electriciaus as Nicola Tesla and McFarland Moore would not put the condition of things into such simple words, Mr. Moore indeed sayiug, and very scientifically, no douht, that the whole thing is the result of the current heing rapidly disrupted by a magnetic field exterior to the evacuated space.

In fact, the whole problem of light may be said to have become one of vihrations. Its solution, as stated, has heen arrived at hy means of electric sparks thus made to succeed one another rapidly in a vacuum. And aloug these lines has it become a possibility to conduct light through tuhes, with results destined to effect the revolution now on the eve of accomplishment.

"Then we will, iudeed, have beautiful light," says Nicola Tesla. "How few of us realize the importance of the cost of light on the lives of people today. It is not too much to say that when the coming changes are inaugurated our whole municipal life will be trausformed. Light will he not merely a meaus of seeiug at night. It will become the great source of beauty in streets aud homes. Heretofore the difficulty of getting both light and heauty has seemed insuperable. We now have the means of produciug light that will uot merely be beautiful itself, but will make all thiugs beautiful."

"And how soon may we look for all this?"

"As soou as the matter of cost has been reduced within due limits. It will undouhtedly be reduced in time. He would be a rash electriciau who ventured to say precisely when. It may be some years. Perhaps a genius will hit upon the true method to-morrow. At all events, electric light cannot fail to be ultimately one of the cheapest of commodities."

Mr. Tesla concedes that existing electric light fixtures are too unpleasantly evident. In the coming condition of things they will he eliminated so far as being visihle is concerned, unless some special effect were sought. In a great hall, for instance, the light would stream from the capitals of its pillars, or it could he as easily arranged to shed itself from the ceiling or the dome cornices. The illustrations herewith will give an idea of the effects Mr. Tesla had in mind. Separate lights, such as we have now, will become things of the past.

"The transformation iu street illumiuation will be very marked," he declares. "The unsightly pole will no louger he seen. Light may stream from a statue or from a fountain in great waves. Its source will be hidden. Its very quality will be chauged. The glare now so ungrateful to many eyes will give way to a sympathetic glow."

The young electrician was of the opiuion that the popular mind and taste were not sufficiently educated on the subject of electric lighting.

"The most wretched makeshifts are tolerated," he says, "because the puhlic have not as yet beeu accustomed to the best results. There was at one time, indeed, a prejudice against electricity itself as a means of lighting, owing to its depressing effect on some people. To-day the improvements are so marked that the light is preferred to gas. In the same way the improvements to come will be so great that the unsightliness of present methods will be deemed unendurable. It is hardly too much to say that the heautifying of cities will never he adequately undertaken until the electric light has been improved, or rather, reudered generally available in its new form. Then we may look for decided alteratious in the appearance of the streets of our great cities.

A striking improvement, moreover, will he the absence of sharply defined shadows that detract so much from the advantages of the present lights. We will have not lights but light, as Mr. Moore so graphically puts it. Phosphorescent electric light so closely resemhles the light of day that the coming era will practically be one of unbroken day.

The elimiuatiou of elaborate fixtures in great edifices will he a very conspicuous cousequence of the reform. In spite of the artistic nature of the candelabra which have been introduced into the more preteutious structures, they are a serious drawback to the stateliness of some forms of Gothic and Greek architecture, and, as architects well kuow, it is frequently necessary to modify an interior on this account. But nothing can he conceived more majestic than the iuterior effects which will become possible by the introduction of the new method. No glohes, no hrackets, no candelabra, can break the sweep of pillar or nave. There will be greater cleanliness, as well as beauty, aud an immeuse saving of time aud trouble, not to speak of expense.

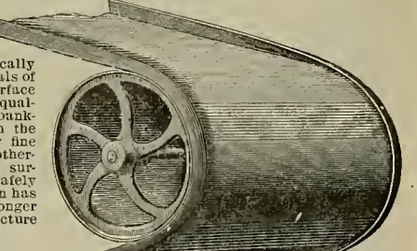
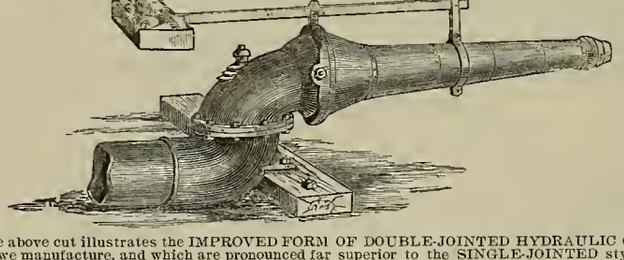
The Blasdel Concentrating Belt Co.

WE are now having our new Improved Concentrating Belt manufactured iu San Fraucisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make auy length or width desired. The advantages of these belts over **any others** will he readily seen by practical millmen First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the helt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt the surface of which is entirely smooth. We can safely say that it is a hetter concentrator helt than has ever heen manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flauges when desired.



H. G. BLASDEL, JR., Manager,
419 California Street, - - - - San Francisco.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

Practical Information.

American Lumber Abroad.

A publication from the State Department consists of reports from American consuls throughout the world regarding United States lumber in foreign markets. While intended primarily for the advantage of American lumber producers and shippers, the information is of unusual general interest. The remarkable fact is shown that the United States sends lumber to every country on the globe, and that while in many lands the market is virtually controlled by the shippers of this country, there are still greater possibilities of increased sales.

Nearly all the building lumber imported by Africa, it is said, comes from the United States; that Japan buys it, and that no other lumber enters South American ports. In Samoa 4c a foot is paid for rough Oregon pine and California redwood. Hawaii, by letting American lumber in free of duty and charging 10 per cent ad valorem duty on Canadian lumber, virtually prohibits the importation of the latter. Consul Mills, at Honolulu, reports that all the timber used there comes from the United States, and that it amounts to 15,000,000 feet annually. Even the island of New Caledouia prefers pine from Washington, and pays about $20 for 53 cubic feet. All the lumber used in Madeira comes from Maine, North Carolina and Nova Scotia, while Mexico and the West Indies rely wholly upon the United States. Australia buys $1,000,000 worth every year, and would take as much more if it could be bought readily.

The great difficulty appears to be in procuring the transport of American wood. Little is carried by American ships. The principal rivals of this country in the world's lumber trade are Canada and Norway, except in England, where Russia and Germany are competitors, and in Austria, which is supplied by countries on the Mediterraneau. Austria, however, gets her staves from the United States, as do most of the other nations of Europe. More lumber from the United States than from Canada is used in Great Britain. Nearly all the spools are made of white birch from Maine. Even Oregon timber reaches England.

One consul protests against selling American lumber in foreign countries because it may ruin the forests of the United States. It appears from most of the consular reports that comparatively few countries have wooden houses, on account of the great expense of lumber, and that transportation facilities alone prevent the substitution of wood for stone and similar materials. This is generally the case in tropical countries, where the woods are too hard to be profitably used for ordinary construction.

From a business point of view it is shown that the American export lumber trade is still in its infancy, though American timber is probably more widely known than any other product of this country.

Aluminum does not appear likely to replace steel in the making of medical instruments. A physician who has tried it says the aluminum probes, sounds, tongue depressors, etc., do not oxidize, but he finds they are deficient in elasticity and stay after pressure. Moreover, he adds, the aluminum is so light that it makes him feel as if he could put no trust in it; he likes, when he uses an instrument, to feel that he has got hold of something.

The latest number of the *Bulletin* of the American Geographical Society announces that the recent study of the observations on mountain summits in the neighborhood of Mount St. Elias shows that Mount Logan is the loftiest peak in North America, with a height of 19,500 feet, thus being 1200 feet higher than Orizaba and 1500 feet higher than Mount St. Elias.

Burial at sea will, for some people, lose half its terrors if, as the investigations of Captain Maury lead us to believe, it is true that at certain depths decay is practically arrested and all the corpses which have been committed to the deep in blue waters, with weights attached, are now standing on the bottom with lineaments and features as perfect as they were on the day whereon their comrades cast them over the ship's side.

One of the latest trials of the profit-sharing system has been undertaken at Westfield, Mass., by the Foster Machine Company. Each employe is supposed to be a stockholder to the extent of $600 or more, and at the end of the year he receives a dividend thereon at the same rate as the paid-up stockholders. If this is ten per cent he gets $60 or more. Meanwhile, he receives his regular wages.

The telephone business has developed an interesting fact that may check the growing popularity of aluminum. That metal has recently been used in telephone diaphragms, and there are signs that it corrodes under the action of the human breath. It is argued that if such corrosion results from that agency, the metal may be injuriously affected by vegetable acids.

Lieutenant F. Boyer, of the French navy, to avoid collisions, proposes to introduce at the top on all fast sailing steamers an electric light, which will cast a beam ahead to indicate the direction in which the vessel is steering. So long as the approaching ship was not in the actual pencil of light it would be unnecessary for her to alter her course.

The latest thing out is a pulseometer, by which the life insurance examiners can tell to a fraction the exact condition of an applicant's heart beat. An electric pen traces on prepared paper the ongoings, haltings and precise peregrinations of the blood, showing with the fidelity of science the strength or weakness of the tell-tale pulse.

Touch the convex side of a watch glass upon water so as to leave a drop hanging on the glass. Pour a little ether into the concave side and blow upon it. The rapid evaporation of the ether will render the glass so cold that the drop of water will be frozen.

The Mechanical Engineering Department of the Washington Agricultural College and School of Science, Pullman, Wash., now occupies its new $10,000 building.

One of the biggest projects now before the engineering world is the construction of a storage reservoir in the Nile above Egypt.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 2, 1894.

The slight fluctuations of the week in silver leave the price the same. As compared with '93, the seven months of '94 show a depreciation. The highest price reached in London in '93 for an ounce of British standard silver (.925 fine) was in January—38 9-16d., equivalent to $0.84724 per fine ounce, and the lowest 30½d. for British standard, or $0.66426 per ounce for fine silver. The highest average London price for any one month in the year was 38.356d in February, and the lowest 32.015d., the average price in December. The highest monthly average price of fine bar silver in New York was $0.84380 in February, and the lowest $0.70250 in December. The difference between the highest and lowest monthly average price was greater than in any year since 1880, amounting to 16.7 per cent. The average London price for the whole year of bar silver, .925 fine, was 35.596d., and the average price during the year of fine bar silver in New York was $0.78219, a decline as compared with the average price in 1892 of over 10.5 per cent.

The following table shows in the first column the average London price per standard ounce, .925 fine, in pence; in the second column the equivalent in New York of the London price per fine ounce, the rate of exchange being also considered, and the third column the actual selling price per fine ounce in New York. The averages are for the month:

	Average Prices—		
1893.	London. Standard Ounce.	New York. Equivalent. Fine Ounce.	New York. Price, Fine Ounce.
January	38.321d	$0.8217	$0.84115
February	38.356	0.84316	0.84380
March	38.108	0.83255	0.83713
April	38.028	0.83610	0.83735
May	38.069	0.83856	0.84081
June	37.279	0.81654	0.81802
July	33.060	0.71981	0.72333
August	33.944	0.74337	0.74851
September	34.120	0.74709	0.75210
October	33.608	0.73339	0.73711
November	32.240	0.70390	0.70947
December	32.015	0.70177	0.70250
Year	35.596d	$0.77986	$0.78219

The greatest range of London prices in any month was in June, when quotations fell from 38¾d to 30½d. the closing price in December showed a slight reaction from the fall which followed the closing of the Indiau mints, but it was only a slight one.

So far in '94 the averages for the months are as follows:

1894—	London. Standard ounce.	New York. Fine ounce.
January	31⅛	67⅝
February	29⅛	63¾
March	27⅜	59¾
April	28¾	62¾
May	28⅛	62½
June	28⅝	62⅝
July	28¾	62⅝

In copper the future is as uncertain. Like silver, it is absorbed in India, where it is almost entirely used for religious purposes, except where the worshiper is so rich he can afford silver. All the requisites for Hindu worship—the shrines of the gods, the platter with its floral patterns, the pedestal on which the idol is placed during the sacred bath, the vessels for holy water—all these in a Hindu temple are of copper.

Regarding the future of the red metal, it is believed the preseut low price cannot in the nature of things be permanent. This belief is shared by W. T. Sargant & Sons, who, in their latest circular to hand, say:

The statistical position of copper is one of unusual interest. It is just twelve months ago that the disturbed state of American trade showed itself distinctly in the utter inability of the United States to consume the metal at anything like the old rate; and from July 1 to December 31, 1893, it supplied Europe with 57,425 tons of copper, against 16,901 in the same time in 1892. During the six months, say from January 1 to June 30, 1894, it has further supplied 37,394 tons, against 19,989 tons in the same months of 1893. This increase of 57,950 tons in twelve months has been followed by an increase in our visible supplies of 117 tons. In other words, Europe would have been starved out had this surplus not been received. Sball we receive a similar surplus in the twelve months now ensuing? At present the probabilities are greatly against it. There is not the same pressure to sell on American account in Europe, and the reports point to a moderate and steady revival of demand in America. The producers there, seeing how entirly they hold the key of the situation, might determine to lessen the output, which is at present going on at the fullest possible rate. The present situation seems, then, to indicate that with the continuance of a large production aud a small consumption in America the surplus will not add to our visible supplies in Europe, but that we are liable to the double contingency of a larger consumption and smaller production in America that would force the demand heavily on to the European reserves. What justification, therefore, is there for copper remainiug at the present level of intense depression? Our price to-day is £10 per ton below the average of the past ten years, whereas we have facing us eventualities that might amply justify prices £10 per ton above such an average. We never remember a position so clearly justifying holders in nursing their stocks in expectation of a demaud from consumers to clear them out of it at higher rates.

The lead market is as heavy as the avoirdupois of the metal itself.

Mining Share Market.

SAN FRANCISCO, August 2, '94.

A little stir in Gold Hill shares was the only feature of a dull week. The shorts seem to have gone out of business on Pine Street, there being nothiug of present encouragement in prices. The assessments of the first seven months of '94 have been light, comparatively, the companies generally being in good trim financially. The stock business simply trains with all other lines, and till there is a general move, there will be little of import.

The Savage will try what virtue there is in having 800 tons of low-grade ore concentrated.

The Morgan mill resumed last Wednesday on 1000 tons ore from the Con. Cal. & Virginia. Work is also resumed in the Belcher, Yellow Jacket, Crown Point and other Gold Hill mines.

Miller, Sloss & Scott have sued the Integral Quicksilver Mining Company for $31,325 goods alleged to be sold and delivered.

Dividends in July.

Totals	$847,400	$875,520

The local savings banks paid out last month about $2,000,000 semi-annual interest on deposits.

The Marysville *Democrat* and Sutter *Independent* are having a lively discussion as to the object of the building of the dam at Deguerre Point, this side of Smartsville. The *Democrat* contends it is for tbe purpose of restraining the debris in the tributaries of the Yuba, and thereby improve the future navigation of the river. The *Independent*, on the other hand, conteuds that the building of the dam is in the interest of future hydraulic mining. The *Independent* is correct iu its assumption, says the Nevada *Transcript*. That dam is to be built so as to enable hydraulic mining to be resumed all along the ridge in Nevada county, where it has beeu estimated that there are not less than two hundred millions of gold which cannot be taken out in any other way than by hydraulickiug. Just as soon as that $300,000 dam is built permits will be granted to resume hydraulic mining, and then the tons of gold which will be taken out will make times in California livelier than they have been witnessed in thirty years. The resumption of hydraulickiug on the ridge means the employment of a thousand or more men, au increase of several millions to the taxable property of the county, besides relieving the stringency of the money market throughout the world. The gold that is now locked up is needed very badly, and it must be taken out.

The Morning Star mine at Iowa Hill has declared a $4 dividend.

Oldest Mathematical Book.

The oldest mathematical book in the world, which dates some 4000 years back, and was written in Egypt, contains a rule for squaring a circle. The rule given is to shorten the diameter by a ninth, and on the line so obtained to construct a square; and this, though far from being exact, is near enough for most practical purposes. Since then the amateur squarer of the circle has been a thorn in the side of the professional mathematician. Learned societies at last, in pure self-defense, made a rule that all solutions of the problems sent to them should, without examination, be consigned to the flames. In the last century a Frenchman named Mathulus was so sure that he had succeeded in squaring the circle that he offered a reward of $1000 to any one who proved his solution erroneous. It was shown to be erroneous, if not to his own satisfaction, at least to that of the courts, and he had to pay the money. Mathematicians have long been convinced that the solution was impossible; but it is only a few years since they were able to demonstrate this.—Engineers' Gazette.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 24, 1894.

523,473.—SASH BALANCE—L. Huntington, Tahoe, Cal.

523,440.—LIFTING MACHINE—D. Nelson, Reno, Nev.

523,309.—GAS ENGINE IGNITER—A. J. Painter, Pasadena, Cal.

523,389.—FINGER GUARD—A. T. Snell, Santa Barbara, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

JOINT AND BEARING.—Weldon C. Rarig, San Francisco. No. 523,238. Dated July 17, 1894. The object of this invention is to provide an improved means for securing removable bushings which are employed to form the wearing faces of a joint. It consists of one or more elastic sleeves open along one side and adapted to fit upon the pin which forms one part of the joint, and within the eye or box within which the pin enters. The elasticity of the inner one contracts it upon the pin and the outer one expands within the box. Projections upon one part and corresponding depressions upon the other lock the sleeves to their respective parts when required, while thin contact faces receive the wear. This allows the sleeves to be easily removed and replaced at a trifling expense, and the more important parts are preserved from wear.

SASH BALANCE.—Louis Huntington, Tahoe, Cal. No. 523,473. Dated July 24, 1894. This invention relates to an improvement in devices for opening and closing windows without the use of weights or springs. It consists in the combination of a sliding sash with a horizontal revolvable shaft which carries one or more pinion wheels, the teeth of which mesh with corresponding teeth in vertical racks projecting from and secured to the sash. A flanged guide wheel is situated near the pinion wheel so that the rack passes between this guide wheel and pinion wheel, and is thereby kept in engagement with the pinion. A means, consisting of a band or cord passing around the wheel upon the shaft, is employed for rotating the same and raising or lowering the sash.

Again in the Lead.

It is rare that an award is so meritoriously bestowed as that which gave to George E. Woodbury of this city the first premium at the Midwinter Fair on his concentrator. The Woodbury Concentrator has successfully stood the test in numerous competitive exhibitions and in practical working alongside of other machines. It took the first premium at the last two fairs of the Mechanics' Institute, the first premium at the State Fair in 1892, a similar award at the Columbian Exposition at Chicago, and it has now captured the first prize at the Midwinter Exposition.—*S. F. Report.* *

Do You Own a Mine?

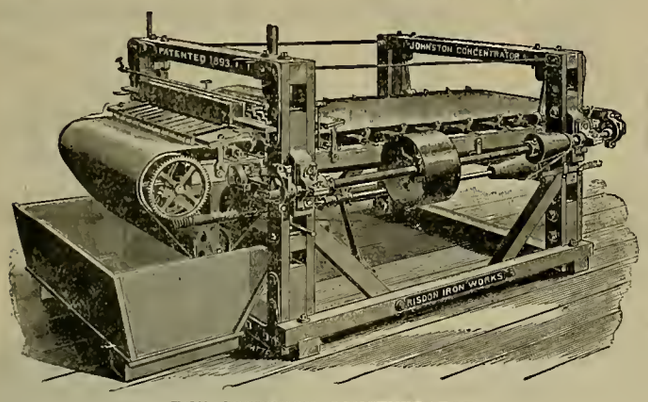
If so, you are interested in concentration, a process which requires no description, and the machinery used is pretty generally known. It can be safely stated without going into a description of several new concentrators, which, like the pulverizers that come out to displace the stamps, are heard of for a little while and then drop out of sight again—that where sulphurets are of such value as to make close saving necessary, the Frue Vanner, or Concentrator, is always used. In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4000 of these machines sold. They are in use in every part of the world where mining is carried on, including Africa, Australia, New Zealand, India, Siberia, South America, China and Japan, and a great many of the smaller provinces. There have been sold on the Pacific coast alone over 1600 of these Vanners, and in all cases they are giving entire satisfaction.

From time to time valuable and important improvements have been made in this machine, the most notable being the Brownell patent flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of a belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain, either at the edge or at the base of flange, as is the case in all belts with a raised edge.

Illustrated catalogue of this concentrator will be furnished upon application to James S. Brownell, Western Agent Frue Vanning Machine Co., 132 Market street, San Francisco, Cal. *

The Johnston Concentrator.

SIMPLICITY OF CONSTRUCTION. ✦✦ GREAT DURABILITY. ✦✦ EASE OF OPERATION. ✦✦ INCREASED PERCENTAGE OF SULPHURETS SAVED.



THE JOHNSTON CONCENTRATOR.

THE HUDSON GOLD MINING CO., WARD, COLORADO, June 8, 1894.

RISDON IRON WORKS, San Francisco—GENTLEMEN:—After a thorough test of the Johnston Concentrator, I am so well satisfied that I wired you to ship me two more as speedily as possible. I find the machine well constructed, easily kept in order, requiring but little attention, and doing entirely satisfactory work on our ore. After my experience with other tables, I am congratulating myself on my possession of the Johnston. Yours faithfully,

B. LANGRIDGE, Ph. D., Mining Engineer.

(COPY.) SAN FRANCISCO, CAL., June 1, 1894.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco:

GENTLEMEN:—We have tested the Johnston Concentrator furnished us by you on trial; and after an exhaustive test, we are satisfied it is the best in the market. Please prepare and ship us, as soon as possible, THIRTEEN more machines.

Yours truly, APOLLO CONS. MINING CO.
[Signed.] By LEON SLOSS.

MINING AND MILLING MACHINERY.

Adapted to every description of Mining and Milling.

Manufacturers of the TUSTIN PULVERIZER; adapted to Wet or Dry Crushing,

Also the well-known HUNTINGTON CENTRIFUGAL ROLLER QUARTZ MILL.

Special Descriptive Circulars of these Mills sent on application.

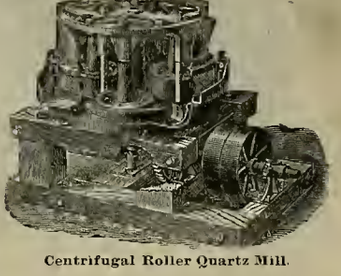
Specialties manufactured by us—"HUNTINGTON" BLAKE ROCK BREAKER; "FULTON" BLAKE ROCK BREAKER; FRUE VANNERS; "BOSS" CONTINUOUS SYSTEM.

Manufacturers of all kinds of ELECTRIC LIGHT AND ELECTRIC R. R. AND CABLE R. R. PLANTS. STEAM ENGINES—Plain Slide Valve, Corliss High Pressure, Corliss Compound Condensing and Non-Condensing.

Agents and manufacturers of the DE LA VERGNE REFRIGERATING MACHINES, FILTERS OF THE NEW YORK FILTER COMPANY.

Sole Agents for THE DEANE STEAM PUMP, ARMINGTON & SIMS ENGINES, LEFFEL WATER WHEELS.

Tustin's Pulverizer—Works Ore Wet or Dry.



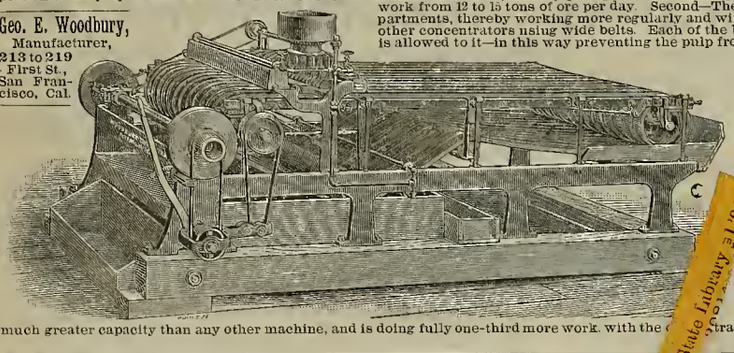
Centrifugal Roller Quartz Mill.

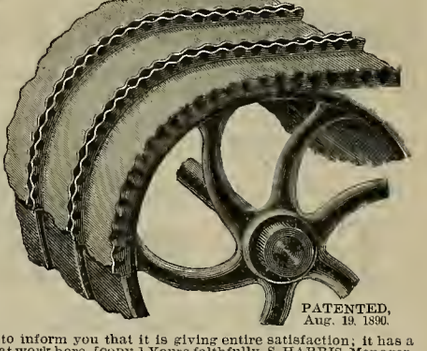
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891 with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
213 to 219
First St.,
San Francisco, Cal.





PATENTED, Aug. 19, 1890.

THE SAN JACINTO ESTATE—Office of the General Manager, Cajalco, Oct. 30, 1891.

GEO. E. WOODBURY, ESQ.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the [illegible] rates equally clean, as from either of the machines at work here. [COPY.] Yours faithfully, S. HARRIS, Manager.

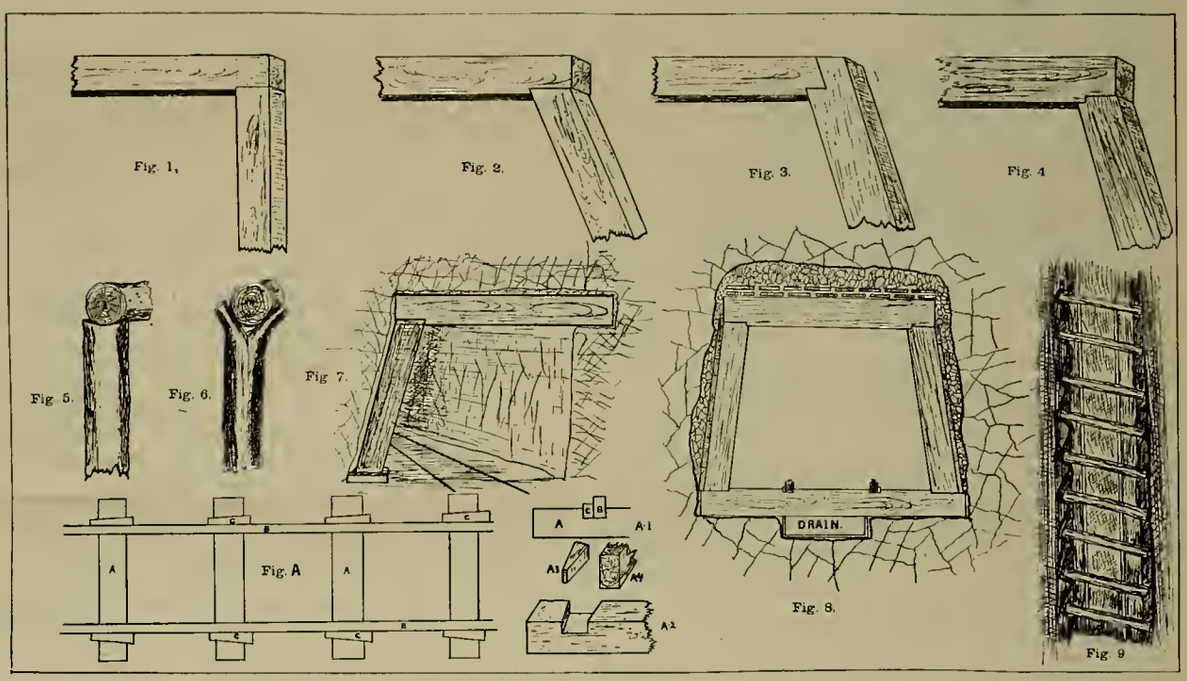
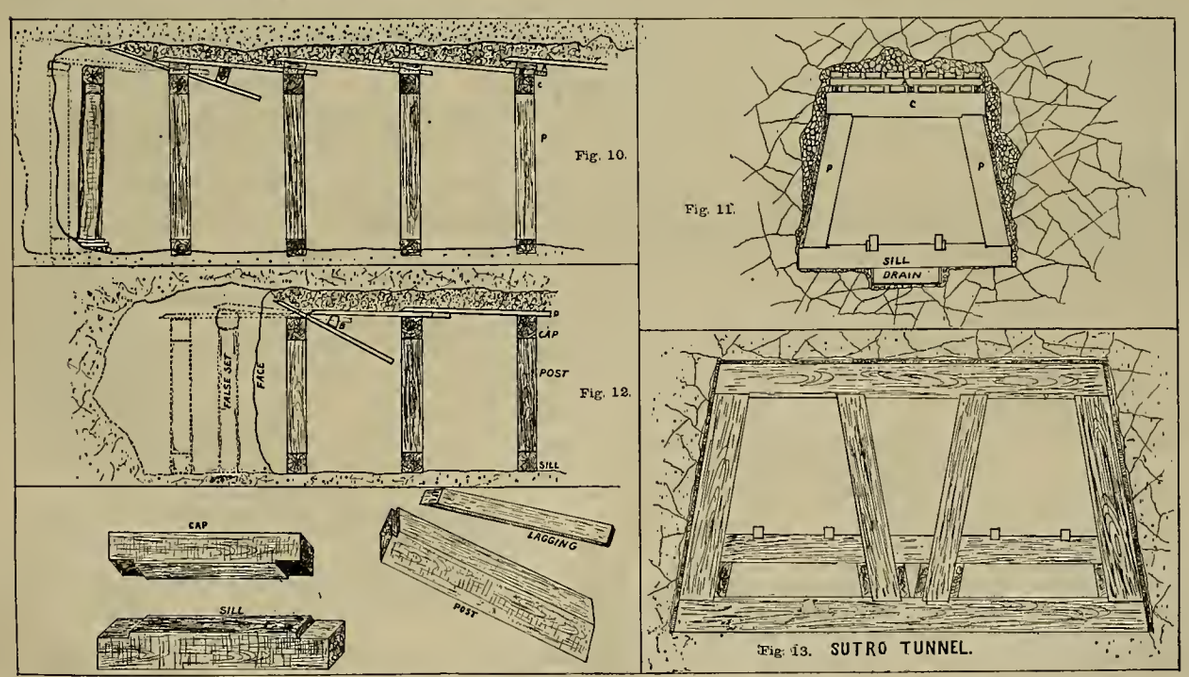
Methods of Mine Timbering.

In last week's issue reference was made to Bulletin No. 2, issued by the State Mining Bureau, treating of methods of mine timbering. The treatise is considered worthy of reproduction. It is a compilation of practical, up-to-date methods and is of manifest value to every mine-worker wherever timbering is required. Some changes have been made to conform to the columns of this journal, such changes having no reference to the matter beyond its necessary adjustment.

The excavation of any considerable amount of earth, or rock, beneath the surface of the ground usually necessitates that the roof, and not infrequently the sides, of such excavation be sustained artificially to prevent caving. In these later years the size of underground excavations is so great, as compared with those formerly made, that the ingenuity and skill of the miner is taxed to the utmost limit. So successful, however, have miners become in devising novel methods to meet daily exigencies that the obstacles usually encountered in mining, among which are flakey rock roofs, soft, running ground, floods of water — sometimes scalding hot — and, worst of all, swelling ground with heavy pressure from all sides, including the bottom, have mostly been successfully overcome.





METHODS OF TIMBERING IN MINES. — (See page 84-85.)

Before Deidesheimer's "square set" system came into use, the ingenious placing of posts, caps and "stulls" constituted the only method of timbering, the multitude of conditions met in the mines making the combinations almost endless. Where veins occur in firm, solid rock, being perpendicular, or near it, the danger of caving is greatly lessened, and the amount of timber required is reduced to a minimum, but these conditions are exceptional.

Veins dip at all angles between perpendicular and horizontal, and vary greatly in width. Moreover, the character of the wall rocks, as well as of the ore itself, is so variable that unexpected problems are encountered daily. The shape of large bodies of ore is a matter of great importance in determining the system of timbering to be employed.

Through all this variety and change in form, dip, size and character of the vein, or deposit, and in the inclosing walls, certain established principles are followed in sustaining the roof and sides, the constant aim being to prevent caving, and to avoid such a catastrophe timbers are placed with a view of holding the rock masses in place, and always in such a manner as to receive the strain directly. Those timbers which reach from wall to wall of an inclined vein (stulls) are not set at a right angle to the pitch of the hanging wall, but at a somewhat higher angle. The reason is obvious, for, if placed at a right angle, should a subsidence of the wall occur, the timber, partaking of this movement, at its upper end, would then have a tendency to fall of its own weight, whereas, if set originally above an angle of 90 degrees with the hanging wall, the subsidence of that wall only serves to wedge and hold the timber support more firmly, when it must bend and break before falling. When properly placed, stull timbers usually give sufficient warning of their weakness to permit of plac-

RECENTLY car painters in Chicago struck through sympathy for car painters at Pullman. Now the former Pullman car painters have taken the places of the Chicago car painters at lower wages, and the comments of the former Chicago car painters are not flattering to their own self-esteem.

REGARDING the suit against the Bear's Nest mine-owners by Mr. Renshaw on behalf of his English associates, Capt. Carroll, one of the parties interested in the suit, says he will sue the allegators of the charge that the mine was "salted." Should both proposed contests be fought to a finish, the umpire's decision will hardly meet with mutual acquiescence.

CONSIDERABLE comment was made during the past year on the action of the Queensland Mining Government who paternally assisted Australians out of work by sending them out to find gold. The mining papers there said it was a mistake, and it seems that the Government, after a thorough trial of the idea, now thinks so too. The opinion there is that no good resulted from the money so expended, and the Australian *Mining Standard* says the money was "frittered away." The Australian Minister for Mines thinks that any money spent in the future should be upon lines for the purpose of finding gold at different levels on fields already worked. It is in pursuance of this idea that work for deep sinking on gold fields has been proposed.

A COMPETITIVE EXHIBITION of gold-saving machinery is to be held at Sydney, N. S. W. All machines and appliances are to be in full working order; there will be a special classification for models and plans. An Australian mining exchange says the schedule is of a character embracing "classes for alluvial and reef gold-saving machinery, beach washers, crushing machinery, amalgamators, ore pulverizers and rock breakers, calcination systems, models of shaft and drive timbers, systems of reduction of concentrates, pyrites, etc., hydraulic sluicing machinery, and a variety of other things connected more or less directly with the mining industry. It is contemplated also to offer prizes for essays upon the subjects of both reef and alluvial mining, from the point of pegging out claims to retorting the gold, including the systems of working; also for model regulations for the guidance of mine managers and for a prospector's guide, and papers on other subjects." The authorities have granted the use of the Exhibition building. The general arrangements for the exhibition are in the hands of W. A. Macarthur, of Sydney.

Valuation of Mines.

Surprise is sometimes expressed that men will put their money into mining ventures in far-off, out of the way regions when better prospects lie so near. The surprise is enhanced by the knowledge that climate, resources and facility for securing machinery are infinitely superior in the neglected field.

There seem to be two reasons for this. In the first place, in those semi-barbaric districts, inhabited by sleepy, unprogressive people, indifferent to or ignorant of the value of mining property, the superior race finds little difficulty in securing at small cost valuable undeveloped properties, sometimes appropriating them without even the formality of purchase. In these instances the first cost is of no import. In some parts of this and other States everything probable and possible in the way of a prospect is already in private ownership, and once a "location" is made, it is sometimes held at what a would-be purchaser deems too high a figure.

In the second place, the obscure, remote and isolated character of many of these far-off localities lend an added charm to the promotor or middleman, who looks upon such difficulty of reach and research as of value to him in preventing too much knowledge of the matter on the part of the shareholders whom he has in mind.

It is concerning the first probable reason that a word or two may not be wholly out of place.

Most things for sale are "worth what they will fetch." 'Tis different with a mining claim. Sometimes it is worth less than the purchase price; oftentimes more, but, in the case of buying and selling mining property, that is a matter that ordinarily must be determined after the transfer is made. A man may pay $10,000 for a piece of mining property that will show itself worth $1,000,000 after he has spent a few thousand additional dollars on it or it may not be worth the amount annually necessary to expend in order to hold it. For this reason nothing is more difficult to determine than the exact value of a mining claim; therein lies the element of risk. The same general site, appearance and showing that made one claim worth a million will not hold good in the one adjoining it. The apparently high price set on a prospect or location is what deters so many would-be investors from buying. Of course, the probable purchaser will naturally want to buy for as little as possible; the seller wants to dispose of it for all he can get; but there is ordinarily no standard of value, and, hence, an agreement as to what is mutually satisfactory is difficult to be reached. A prospector will search patiently for weeks and months, find a claim, and open it up to the extent of his financial ability; to him it represents a good deal of time, toil, hardship and skill, and when a purchaser does come along the prospector is not apt to undervalue his property. But by holding out for a larger sum than reason and experience tell him he is likely to get he stands in his own light, and so far as he is individually concerned, creates that condition which is the subject of comment. There is the element of chance that must be divided: the chance that the buyer may pay more than the mine is worth, and the chance that the seller may let a really valuable property go for too small a sum. As a general thing the buyer gets the best of it. Some of the biggest fortunes in California to-day are held by men who got their money from mines that other men found and they secured at a trifling outlay.

But, in this connection it must be borne in mind that the time has gone by, in California at least, when a man buying a mining claim does it with the intention of organizing a company, listing the stock, and working the street instead of the mine. Nowadays a buyer of mining property is simply investing his own or somebody else's money as a business proposition; he intends to develop it and run it as any other legitimate business would be carried on. Because of this, the first cost of the mine is of more importance to him than if it were to be made simply the basis of speculation. The time when an atmosphere existed in which to flap the wings of fancy is no more. Because of this it is believed it would be more in line with the requirements of the situation for holders of claims to look at matters as they exist, and think twice before a reasonable offer is refused.

There is more gold, a hundred times more, in this State than has ever been taken out; there are hundreds of valuable prospects held by men who have grown gray in possession; there is a better field for investment of capital in gold mining in this State to-day than anywhere else in the world; there is more present desire to invest in legitimate mining than ever before. Putting these facts together it is unnecessary to more than suggest that the advantage possessed in this regard is not increased by any disposition to let investors pass to other fields by putting too high a price on the property they seek. In these sunset years of the century men will not take the big chances they used in the purchase of possibilities.

An Unfounded Theory.

In the *Engineering Magazine* for July is a page that should not go uncontradicted, wherein is asserted that the "character and tone" of the precious-metal miners are behind what they used to be in the days of auld lang syne. In this assertion the ordinarily exact and commendable comments of our contemporary are at variance with the facts. Both in "character and tone," the gold and silver miner of to-day compares favorably with any in the past. In all that goes to make a man there is no deterioration. He is just the same patient, plucky, persevering, hopeful mortal he always was; just as full of work and energy, just as devoid of petty meanness; just as enterprising and intelligent; more peaceable and practicable in his methods, and as open-handed as his surroundings and circumstances will permit.

The argument of the *Engineering Magazine* in the article referred to is that civilization and the railroads having made travel and life generally easier, the miner of to-day has gone backward and lost the manly qualities that characterized the miner who crossed the plains or came around by the Isthmus or the Cape.

Far be it from us to deny the good qualities of the miners who founded this and other far western States. In the days when none but the daring started, and none but the strongest survived, there came a grand contingent of sturdy men who, in their day and generation, wrought greatly. All praise to them.

But, as they pass away, their successors display no less the possession of the same qualities that made the pioneers heroic. True we ride in easy cars to-day across the way they blazoned with their bones; true the haze of violet-colored sentiment that always irradiates the past does not enwreathe the sunlight of the present; but it is not true that the miner of '94 is inferior to the miner of '49; "or the spring of '50;" nor is it likely that were the men of the preceding generation here to cope with the changed conditions of to-day their achievements would exceed those of their worthy successors. While "it is natural for man to indulge in the illusions of hope," it is also natural for some men to indulge in the illusions of memory. When one is retrospective he always thinks of the pleasant occurrences; the successes; the flushes of triumph and other "flushes" that were temporarily successful, and usually ignores the troubles that beset all men alike in all years. So in writing of "old times" in mining regions 'tis only natural to gild the glory of a bygone day. That is all right; but it is not just to say that the men of to-day who unlock the nation's treasure house are in any way inferior to them who first found where lay the precious store.

The miner and the walking delegate, it should be remembered, are two different types of humanity.

FROM Prescott, Arizona, comes complaint regarding the passage of the recent bill suspending the requirement for assessment work on mining claims for this year, it being asserted that it does not benefit that section. As the bill is passed now, it seems needless to hold any post mortem on adverse comment. It is in order, however, to suggest that the laws Congress makes or suspends are for the entire country, and as in all such cases of wide-spread jurisdiction, it is impossible to expect unanimity of opinion concerning their effect.

Concentrates.

THE Park Gold Mining Company has incorporated at Denver with a capital stock of $750,000.

THREE HUNDRED THOUSAND silver dollars will be coined at the San Francisco mint this month.

THE North Banner Consolidated Tunnel Company has levied an assessment of five cents per share.

THE Golden Chain Mining Co. of Lake county, Col., has been incorporated with a capital stock of $100,000.

THE Allegheny and Cripple Creek Mining Co. of Col., with a capital stock of $1,000,000, has been incorporated.

W. W. RODEHAVER is charged with embezzling funds belonging to the Placer County Miners' Association.

THE Alaska *Mining Record* says that the gold output for last year in the Silver Bow basin there exceeded $120,000.

A SON of Major-General O. O. Howard is putting up a 20-stamp mill on the Holdsworth mine, Meadow Lake district.

THE coal mines in southern Colorado and New Mexico reopened last Monday, giving employment to about 2500 men.

THE Medford, Or., bank has a $1000 gold brick, the result of a clean-up of the Hammersly Mining Company, after a ten-days' run.

THE Ontario government has bought two diamond drills for exploration purposes. One will be kept at Toronto and the other at Rat Portage.

A STRIKE of free milling gold ore is reported in the Annie lode, fifteen miles east of Mosca, Col. Alleged assays give a result of "$42,000 per ton."

THE Lookout Mountain Gold Mining Company has filed articles to do business on Gold creek, in Granite county, Col. Capital stock, $500,000.

THE Cochiti, N. M., Mining and Milling Company have their new mill and amalgamator at work, turning out at present thirty tons of ore daily.

LA VITA, Colorado, and vicinity are elated over a strike that has been made on Silver mountain. The ore is said to assay over $700 in gold to the ton.

THE Gold Valley Mining Company has been incorporated by C. C. Melver, W. X. Sellar of London, J. W. Seymour of Texas, H. Steil and D. Cushman.

JOHN D. BEAM, manager of the Livecoaks Mining Company at Coarse Gold gulch, was crushed and instantly killed by the fall of a hanging wall at the mine last Saturday.

THE Jacksonville, Or., *Times* says some Chinese who are mining on Elliott creek were surprised by white men at dinner last week and robbed of about $200 in gold dust.

THE insurance men are willing to rebuild the mill recently destroyed at Hiko, Nev., but, with the present silver outlook, the owners would rather have the insurance money.

THE last clean-up of the Reno Reduction Works amounted to $1733. The owners of the Golden Eagle mine from which the ore was taken are prospecting for a large deposit of ore.

THE Denver *Record* thinks a dead line should be drawn on the finding of "the richest gold mine in the world" again for three months. It has been found six times in four weeks.

THE Sand Creek Mining and Improvement Co. has organized in that Montana district with $1,000,000 capital stock. The company has twenty-one claims that it proposes to develop.

FOR half a million, cash, the Portland Gold Mining Co. of Colorado Springs, Col., becomes the owner of four mines adjacent to its present property, thus stopping costly litigation.

POORMAN, Idaho, stock is now quoted at twenty-three cents, a falling off of more than fifty per cent during the past six months. The depression in the silver-lead industry is the cause.

THE Los Berros gold mine, sixty miles from San Miguel in the Jolon country, cleaned up $2800 for the month of June, and during the three years of its existence over $250,000 has been taken out.

WILLIAM LOBE, employed in the Stickle mine, at Angels, fell 150 feet off the side of a skip last Saturday and was instantly killed. He was a native of Cornwall, England, aged forty-one years.

PORTER BROS., who have been identified with some large mining deals in the Cœur d'Alenes, are negotiating for the Little Pittsburg mine in Spring gulch. The mine is a copper-silver proposition.

EX-SENATOR TABOR'S mining property at Vulture, Arizona, has been attached to satisfy a claim of $7820 of the National Bank of Madison, Wis., and one of $11,200 of the National Bank of Springfield, Illinois.

THE Hecla Consolidated Mining Company at Glendale, Montana, on July 25th paid the 127th dividend of one per cent ($15,000), making the total dividends paid up to date under the present management $1,905,000.

JOHN HAYS HAMMOND is on his 1500-mile journey through British South Africa to inspect and report on the mines owned by the company, for which he is managing engineer, and which pays him an annual salary of $60,000.

THE Keaunedy, Nev., *New Era* says there is a mining notice near that town which reads: "We claim 1500 feet in a promiscus directum along the curse of this vane. This claim shall be nowen as the Blew Id Nel."

SENATOR STEWART'S new mining law, recently published in full in these columns, has passed the Senate, and may, with some amendments, pass the House this session. In its present form the bill is not wholly unobjectionable.

AT Hillsboro, New Mexico, placer miners screen their gravel through a series of meshes, reducing it to one-tenth the original bulk. The gold is found in the concentrated product sent to the mill to be amalgamated.

GEORGE BENDIE, a prosperous and wealthy mining man of southern Mexico, was assassinated last week in San Nicholas Del Ora, where he owned several valuable mines, by a former employe, a Mexican named Reyes, who escaped.

THE United States Court at Denver has made a decision by which Margaret Billings and others, heretofore comparatively poor people, are given $740,000 in money and a thirteen-forty-seconds interest in the Emma mine of Aspen, Col.

THE valuation of the Harqua Hala (Arizona) Bonanza mine has been raised for purposes of taxation from $50,000 to $150,000. The property is said to have been sold last year for $1,000,000, and to be producing $300,000 in gold bullion per annum.

THE Winnemucca *Silver State* says: A silver camp will soon spring into existence south of Winnemucca. Assays taken from ledges give over 100 ounces in silver and a few dollars in gold. An assay from Virginia City showed 175 ounces in silver and $9 in gold.

C. W. MILLER, F. Patterson and J. D. Cook of Portland, Or., have incorporated the Farmer's Flat Mining Company with a capital stock of $40,000. The company will do general mining business, principally near Jacksonville, having purchased the Miller mine for $12,000.

THE discovery of lead carbonate—the ore which gave Leadville its boom—is considered by mining men important for the Cripple Creek, Col., district. The vein is reported to be four feet in width, and is all pay. An assay returned $40 in gold, 280 ounces silver and 33 per cent lead.

THE recent effort to organize a stock company to buy and work the Magalia mine was a failure. N. D. Rideout, the owner, proposes to sink a vertical shaft 500 feet, through which to pump the water. It is believed were the water got rid of the property would be a good paying one.

STARTING within the limits of Denver and extending about twenty miles up and along the course of Cherry creek, says the *Record*, 150 men are now extracting gold from dirt and gravel and making it pay. Most are washing, but in several instances dry placer machines are used to do the saving.

THE Tombstone *Epitaph* reports that the Quijotoa property, comprising the last of the Bonanza Company's possessions, has been bought for the nominal sum of $3500. This property originally cost in the neighborhood of $250,000, and consists of quartz mill, pump, well, piping and mining implements.

AT Florence, Col., the work of putting machinery in place for the Economic Reduction Works is about finished. The plant will have a capacity for treating 500 tons of ore per day, high or low grade, refractory or free milling, by processes which it is claimed will save all the gold there is in the ore.

THE *Journal-Miner* says the Zero mine in the Hassayampa district is one of the most remarkable in this country. It is said to have paid $100 per foot for every foot of development work done in sinking and drifting, and this, too, with silver only sixty-two cents per ounce, the property being a silver producer.

THE man who robbed the Alaska-Treadwell chlorination works of $13,000 last January has been arrested in the act of disposing of some of the proceeds of the robbery. The chlorinations when stolen were taken seventy miles to Admiralty Island and buried, to be resurrected when the excitement was over.

PETER MCCOURT, manager for Senator Tabor, said in Prescott during his recent visit that he would return in about a month and resume work on the old Vulture mine. About $150,000 will need to be expended in a new mill, in a new pipeline and in a new shaft and lower working before any bullion can again be turned out.

THE Derbec mine has started up again. An arrangement was made with the men to take what comes out of the mine. If the yield of one month is more than $2.50 per day, the surplus will be set aside to make up any subsequent deficiency. The company wanted to reduce the pay to $2 per day, and the above is the result of arbitration.

THERE is considerable mining on the Laramie river at present, and extensive works have been started. Wm. Taylor of Rock creek is doing the most work and is getting good returns. The gold dust is very fine, and gold-saving machines of all kinds are used. The old way of sluicing has been found unprofitable, owing to the lightness of the gold.

THERE are about 300 men at work in the Bohemia, Or., mining region. Two stamp mills are running, and a ten-stamp mill is on the road. Some Tacoma parties will also put in a mill soon. Some ore recently sent to this city from the Bohemia mines is reported to have assayed over $7000 to the ton, which has had the effect of increasing the mining fever.

AT the present time, says the Marysville *Appeal*, the Yuba river, near Parks' Bar, very forcibly reminds one of the sea beach at low tide to see so many parties with spade and bucket, digging holes in the sand here and there, not, however, in search of bivalves or goldfish, but fishing for gold. It is generally understood that some of the miners are very much encouraged with their prospects.

AT Dayton, Nev., last Sunday, nearly all the wood near the Carson river was destroyed by fire. Empire Longabaugh lost 1600 cords, and the Carson & Colorado Railroad Company lost 2165. The fire was of incendiary origin. The fire took place between 2 and 3 o'clock in the morning, and was plainly seen at Virginia, Nev., twelve miles distant. The wood is said to have been insured for $5 a cord.

THE Elko, Nev., *Independent* says: Chas. Graff, from Mardis, brought thirteen ounces of gold dust taken out of the placer claims by himself and partner in two weeks. The gold runs from $18 to $19 per ounce. Graff says that things are booming in the Mardis district, and that there were no idle men, as everybody willing to work has no trouble in finding it.

AN assessment of two cents per share has been levied by the Odin Gravel Mining Company. The Nevada *Transcript* says operations are going ahead very satisfactorily at the mine. It is expected that the rich part of the gravel channel, towards which a drift is now being run, will be struck about the last of this month. In this event it is almost a foregone conclusion that assessments will cease.

REGARDING the falling off in the Bendigo gold yield, the Australian *Mining Standard* says: In the six months ending December last the yield was 116,047 ounces, while the returns for the six months ending June, 1894, show a decrease of 32,601 ounces, the dividends in the same period being £87,913 less than were paid in the last half of 1893. Mining at Bendigo during the first half of the present year has been carried on at a loss.

A PARTY of miners, consisting of W. Snyder, A. Goodwin, Jeff Goodwin and J. H. Fick, of Forest Hill, have gone to North Bloomfield to take charge of a boring machine that is to be used there in prospecting, says the Colfax *Sentinel*. The gentlemen have had charge of the boring machine at the Mayflower for the past year and have used it very successfully. The new machine was fitted up in San Francisco. The boring machine before many years will prove to be a very efficient instrument for prospecting without such great expense.

"ONE of the best showing pieces of property in Colorado was discovered through the constructive instinct of a prairie dog," says P. A. Church of Boulder. "A man named Burr, who found the property, was attracted to it by the sulphides lying at the mouth of the excavation made by one of these little animals. Mineral was found in less than ten feet, running first over $4 and steadily increasing. As the work progressed deeper the returns from the various assays taken at different depths showed about $4000." The mine referred to is the Ella H., which is located at Balfour, and which is at present being worked with much vigor.

THE Tombstone *Epitaph* reports that the Congress mill is dropping forty stamps and rolling sixteen concentrators, which keeps four men sewing up ore sacks, averaging 160 pounds to the sack. The company is also shipping about forty tons of high-grade ore daily. The company has at present 136 men at work underground. The mine shows an abundance of ore throughout all the numerous workings. At the 1000-foot level there are fourteen men at work, and their labor has disclosed a breast of seven feet of high-grade ore, and the ore continues on down below the 1000-foot level, and seems to widen on its downward course. The ground at the lower levels works much easier than that above.

A MAN'S skeleton was found between Cargo Muchaco and Pichaco, in the eastern end of San Diego county, last week, by Benjamin Page of Yuma. On the ground in the vicinity of the skeleton were found a pocket-book, watch, keys and small change, and an envelope addressed to "Peter Zanovich, Yuma, Arizona." A man by that name left Yuma two months ago for this State. The circumstances indicated that the man was on his way to Cargo Muchaco, and, being unacquainted with the country, had been overcome with thirst. Coyotes had devoured the flesh. The skeleton was buried where found, and steps were taken to learn if it was the remains of Zanovich.

A DENVER man says he has discovered a process and has applied for a patent upon a device which will save 90 per cent of the gold in placer mining. The contrivance consists of a number of copper plates, inserted in zig-zag fashion in a sluice, whose dimensions are 3x14 feet. At the top of the sluice-way is a depository for chemicals which aid in retaining the gold deposited when free from sand and gravel in the riffles of the machines and in two deep pockets arranged for the reception of the deposit. The inventor says he has made a test which fully demonstrates the utility and efficiency of the machine. A $5 gold piece was dissolved by muriatic acid, the deposit mixed with sand, and by the aid of this device he says $4.65 was saved.

ACCORDING to the Aspen *Sun* there are 519 salaried miners and 571 leasers working in the mines around Aspen, Col. This does not include office men or men connected with mining companies other than those strictly miners. The number of leasers is no criterion that none receive pay, as it is sure that one out of every three of the leasers receive pay, and are hired in the same manner as the miners. This swells the number of paid day miners to 676, and makes the leasers 314. The wages paid out to the 676 men, allowing $3.25 a day which is a low average, are $45,630 per month, and are nearer $50,000, as the average will be close on to $3.40 per day. Some leasers make money and some don't, but still there is more than $36,000 a month distributed this year than last.

BLACK SAND is being worked at Manti, Utah. The gold is covered by a sort of asphalt, or black wax. This coating must be removed by some acid process before the gold can be collected. The first assay gave $74.24 per ton, and was made from a shot sack full of sand taken from different places now claimed by the Red Creek Company. Pannings of 2500 pounds of sand taken from one place gave less than $5 per ton. If an assay of $20 per ton can be secured, the company will probably continue operations. The entire ground seems to have been worked at some time in the past. A wall surrounds the whole sand bed about three miles in length. This gives evidence of having been constructed for the purpose of working the sand by some process. While digging for bedrock, the prospectors found that the ground had been worked once. This fact gave credence to the story that a veritable old Spanish mine had been discovered. One man claims to have found the ruins of an ancient smelter near the Red creek camp.

Clipped and Condensed.

THE republic of Hawaii has been formally recognized by the United States.

THE Pacific railroad funding bill goes over to next winter's congressional session.

THE tariff bill has reached a favorable stage of compromise between the House and Senate.

C. P. HUNTINGTON is trying to buy the recently completed railway across the Tehauntepec isthmus.

STATE TROOPS have all been withdrawn from Oakland, Truckee and Dunsmuir. Gen. Dimond declares "the war is over."

THE House bill appropriating $50,000 for the construction of a revenue cutter for San Francisco harbor was passed last Wednesday.

IN the Corean war, the Japanese have so far defeated the Chinese by land and sea. China refuses European or American mediation.

CHARLEY MITCHELL, the former proprietor of the Grass Valley *Union*, is receiving many congratulations upon his appointment as refiner at the S. F. Mint.

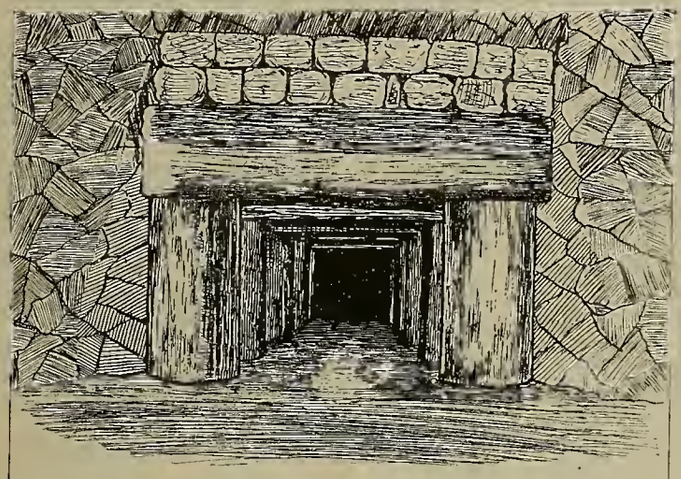
Methods of Mine Timbering.

(*Continued from page 81.*)

ing additional timbers and subsequeutly the removal aud replacemeut of old or weak timbers.

To make an understanding of tbe various practices more compreheusive, a number of drawings have beeu introduced iu this article. As a matter of course, certain exigencies are likely to arise, the character of which has uot been anticipated, but in all cases the principles applied remain the same, and it is thought that the conditions most likely to occur have been treated fully enough to meet the demands of metalliferous mining geuerally.

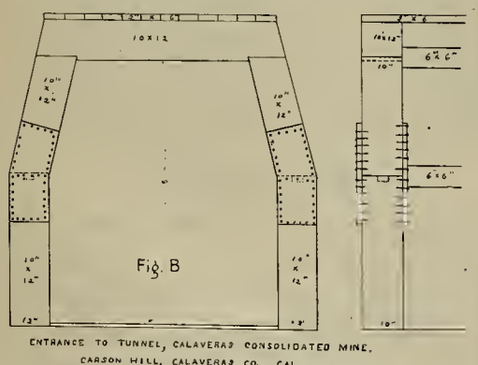
In some instances solid masonry is built to sustain certain portions of mines, and in late years iron has been introduced as a substitute for timber, but in American mines timber is most commonly employed. Ordiuarily tbe location of the mine determines the



ENTRANCE TO AN OLD MINE IN HONDURAS

kind of timber. Piue of various kinds is more extensively used than any otber. Sugar pine and spruce are preferred when obtainable, but yellow pine is by far the most common. Oak is gladly taken when good sticks of sufficient size cau be found. There are oak timbers in mines in Mariposa county, apparently sound, that have been in place for twenty years. They certainly outlast any other timber. Cottonwood aud redwood are sometimes used when no otber is obtainable, but are not at all desirable. In the desert in tbis State, iu parts of Arizona and Nevada, miners take any timber they can get, even resorting to the yucca, which answers quite well for a time in that dry climate, wheu the pressure is not too great. At Silver Reef, in San Bernardino couuty, greeu yuccas were used iu timbering a drift. They still stand iu fair condition, baving been in place five years. The superintendent of the Gover mine, Amador county, California, has commenced some experiments with spruce and sugar pine, placing tbem side by side in the same set in the lower levels of his mine, to test their durability.

The method employed to sustain the roof aud sides of tunuels and drifts are numerous, the existing conditious determining the method. Often the rock is sufficieutly firm to stand without timber, but at times the conditious are annoying and daugerous.



ENTRANCE TO TUNNEL, CALAVERAS CONSOLIDATED MINE, CARSON HILL, CALAVERAS CO. CAL

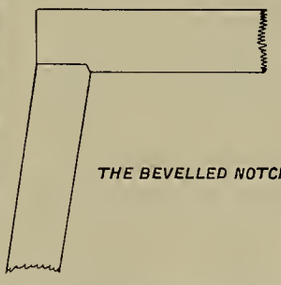
Where the pressure is entirely overhead an upright post is set on either side of tbe tunuel, usually spread somewhat at the bottom, but otherwise always at right angles to the roof. (Drifts are frequently run on an incline, particularly iu blanket veins, and also in fissures having a low angle of dip.) (See Figs. 2 and 4, on page 81.) On these posts are placed a cross-piece called a cap.

When it may occur that the floor of a tunnel, drift or crosscut does not afford a firm fouudatiou for the posts, as in soft, wet fissures, when not in ore, or, as is ofteu the case at the eutrance to a mine, a cross-piece or sill is first laid aud the posts set upou it. A second cross-piece (the cap) is then inserted at the top, the ends resting upon the posts, the cap being employed in all cases, whether tbe sill is necessary or not.

In working ground that is fairly firm, particularly in the drift gravel mines of California, a system of posts and "breastiug caps" is used. Tbis consists of a piece of timber hewn or split, two and one-half feet loug, one foot wide and three or four inches in thickness (the eap). which is placed against the roof, and a post of the neccssary length is set beneath it, being driven into a perpendicular position by blows of a heavy hammer or maul. It is a cbeap aud secure method of timbering small drifts, and is often employed iu large ones, the breast extending entirely across the channel. Lagging placed at right angles to the cap may be driven in above it wbeu necessary.

Very ofteu pressure is exerted from the sides as well as from the top of a drift. In such cases the timbers are framed with a view to bindiug them more firmly together when in place. (Fig. 8.)

Figs. 1, 2, 3 and 4 show several styles of framing timbers for drifts. Of these Fig. 4 is undoubtedly the best. Better than any of these is the bev-



THE BEVELLED NOTCH

eled notch, whieh greatly reduces the liability of the timbers splitting. It has come quite extensively into use of late years. When properly framed and set there is little danger of slipping. Still another, and no doubt the best method of all, has lately come into practice. It is that of nailing a two-inch plauk on the under side of the cap. By this device the fullest strength of the timber is obtained, with no probability of splitting.

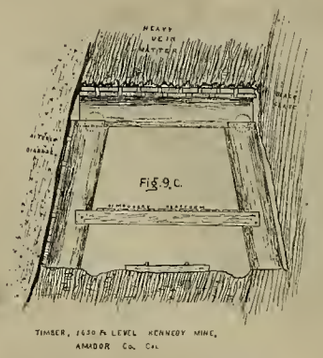
When round timbers are used they should always be stripped of the bark or they will speedily decay. The manuer of framing timbers is the same, whether they be round, bewn or sawed.

Figs. 5 and 6 show a method of placing posts aud caps. It is seldom seeu now. There is nothing about it to recommend it. Oak is the only timber that may be safely employed in this manner, piue being too soft aud quite certain to split.

Where one side of a drift only and the roof need support, the post and cap (Fig. 7) is sometimes employed. One end of the cap rests upon the post, the other on a shelf, or niche, cut in tbe opposite wall.

LAGGING.

When the roof or side of a tunnel is loose and shows any tendeucy to cave, sprawl off or run, lagging must be employed. Lagging is the name given to strips of wood 4 to 6 feet long, 6 to 8 inches wide, and 2 to 2½ inches thick. They are usually split from piue logs, but sometimes 2-inch plank 6 inches iu width is sbustituted. In large shafts in heavy



TIMBER, 1630 ft LEVEL KENNEDY MINE, AMADOR Co. Cal.

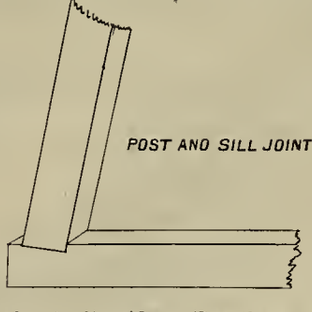
ground 3-inch plank is sometimes employed. The methods of driving lagging are shown in Figs. 10 and 12. The pieces of lagging are inserted over the top of the cap, the euds pointed upward a few degrees. They are driven forward as the work of excavation progresses, when there is danger of caving. Not infrequently ground will stand for many hours, and sometimes for months, before caving, but it is cheaper to timber very soon after the excavation has been made, in order to keep the ground in uormal condition, giving it no chance.

The two systems shown in Figs. 10 and 12, while tbe same in principle, differ materially in detail. In Fig. 10 the lagging is inserted between two caps, which are separated by wedge-shaped blocks, oue of which is placed in the center aud one at either end. (See between A and C, Fig. 11.) The lagging is driven forward as explained. If the ground is very heavy, a "false set" (Fig. 12) is set up, and the ends of the lagging rest upon it. The excavation progressiug and the lagging being driven well forward, the next set is put in position and the lagging driveu "home," that is, until the forward ends find a secure resting place on the true set. The false set is then knocked out and the same proeedure gone through with the next set.

The only differeuce between Fig. 10 and Fig. 12 is that in the former there are two caps, as explained above, while in Fig. 12 the lagging is inserted beneath the forward ends of the next set back. In each case the lagging is kept pointing slightly upward by the insertion of a block of wood shown at B, Fig. 12. When the forward ends of the lagging rest on the false set this block may be allowed to drop out. The system shown in Fig. 10 can be employed much more advantageously and work progress more rapidly iu very heavy ground than when that shown in Fig. 12 is used, which does very well in lighter ground. Where the ground is very bad the lagging must be kept driven as far forward as possible. By observing eare in this matter serious runs are sometimes prevented. Sills are only employed when the bottom of tbe tuuuel does not afford a firm foundation for the posts.

For lagging, spruce, yellow pine and tamarack are much used, but the sugar pine of California has no superior for toughness and durability. Lagging sbould not be too stroug, for in the event of extreme weight it should bend and give notice of impending danger. The miner may then relieve the pressure by cutting away a portion and reinforcing the timbers, thus saving the more expeusive framed timbers and perhaps preventiug a serious eave.

Caps aud posts are all sizes from 4x4 or 4x6 inches up to 24x30 inches, according to the size of the excavation and the character of the grouud. Caps should be free from knots aud checks as far as possible. Less care is necessary in the selection of posts, though all timbers sbould be of good, sound wood. Sills extend somewhat beyond the posts which rest upou them. A shallow notch is usually cut in the sill to admit the post, the bottom of which is cut at



POST AND SILL JOINT

right angles to its sides. (See the accompanying figure.)

The greater care taken iu framiug aud setting up mine timbers the less danger there will be of collapse iu the future. The tools necessary to secure this exactness are a plumb bob aud a steel square. A spirit level is also very useful.

To coustruct a track, cross-ties made of 3x4 scant-

ling are often laid on the floor of the tunnel or drift, and to these are spiked "T" rails. When flat iron is preferred a durable track for permanent use is made by setting long 2x4 scantling in slots sawed in the cross-ties, the long strips being secured by driving in wedges at the side. The details of track construction are shown in Figs. A, A1, A2, A3 and A4, which are on the same plate as Figs. 1 to 9. Upon the scantling stringers may be spiked the flat iron, or, if desired, "T" rail. The scantling should not be spiked to the cross-ties, as nails are quickly corroded by the mineral vapors and waters of mines.

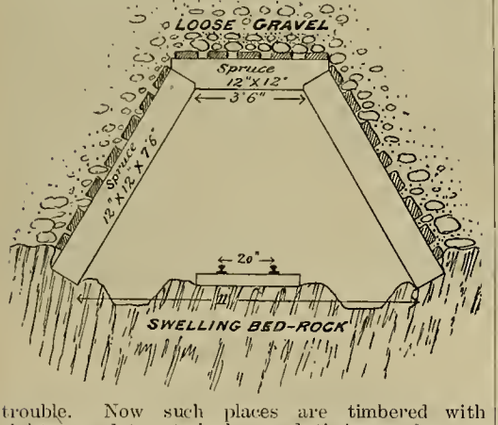
Provision for drainage should always be made at the very commencement of opening a mine, for, though the tunnel may be dry at its mouth, when it has been driven a long way into the mountain more or less water is nearly always encountered. A drain or trench should always be cut in the center or at the sides of every tunnel or drift. Illy drained workings cause the timbers to rot quickly, and also endanger the health of the miners. Neglect to provide drainage very often results in the necessity for retimbering, which expense might otherwise have been avoided for a long time.

Prospectors, in their haste to advance work as speedily and as cheaply as possible, frequently fail to timber properly and to provide for drainage, with disastrous results in the future. Many months of laborious toil are too often lost in this way, to say nothing of the loss of life and limb by the unfortunate miner caught in a cave which might have been easily avoided.

One of the greatest difficulties with which miners have to contend is the swelling of the rock masses into which their excavations have penetrated. Often the force or pressure against the timbers caused by the swelling of the ground is irresistable. It is a common feature of many of the mother lode mines in California, particularly in Tuolumne, Calaveras and Amador counties. Swelliug bedrock is quite common in the gravel drift mines of California. All Comstock miners know what swelling ground is. It is one of the most serious obstacles with which they have to contend.

In a general way it may be said that the only recourse is to timber in the most substantial manner, and then, by frequently, as is often necessary, cutting out a portion of the heavy ground and relieving the pressure, the timbers may be kept in place and the excavation kept open. Fig. 14 represents a cross-section of a tunnel where the trouble in its worst form was encountered. By setting timbers in the manner shown in the cut, placing the sets close together, and relieving the ground by the removal of the encroaching portion from time to time, the trouble is reduced to a minimum. In the Hardenburg mine, Amador county, swelling ground has caused a great deal of trouble lately. The 900-foot level is run in a zone of crushed foliated black slate, which, on the footwall side of the drift, when first broken appears firm and solid, but in a few days it commences to spawl off and to noticeably encroach upon the drift. It continues to swell, displacing timbers or breaking them, and causing no end of

Fig. 14.



trouble. Now such places are timbered with eighteen and twenty-inch round timber and somewhat loosely lagged. But few days pass before it is necessary to take out lagging and cut away the swelled ground.

In running the main tunnel of the Hidden Treasure mine at Forest Hill, in Placer county, swelling bedrock was encountered. Mr. Ross E. Browne, E. M., in his article, "The Ancient River Beds of the Forest Hill Divide" (*vide* X report, State Mineralogist of California) says of this occurrence:

"The pressure of the gravel is not great, but the swelling bedrock has been a source of trouble, driving the legs of the timber-set inward and crushing the cap. After many unsuccessful attempts to overcome this difficulty, the legs were given an increasingly greater bottom spread, until finally it was found that they remained stationary. The swelling bedrock is removed from time to time and the track adjusted. The accompanying cut shows the form of tunnel timber-set now used in bad swelling ground. Sets are first put in four feet apart, and in the course of a few months center-sets are placed between these. Timber sets on this plan have now been in place three years (1879), and are still in good condition. In 8500 feet length of tunnel there are about 4000 sets of timbers. Two men are kept constantly employed in casing and repairing the sets and adjusting the track."

Some of the drift mines on Sugar Loaf mountain, near Nevada City, Cal., that were worked twenty-five years ago, were timbered in a very peculiar and unusual manner, owing to the swelling of the bedrock. Massive timbers had been placed time and again, only to be forced out of place or broken. At last the method here described was introduced and found to answer every requirement most admirably. It was subsequently tried in some of the other mines of the neighborhood with equally satisfactory results. Once firmly placed, the timbers were never again renewed, standing until the mine was worked out.

The plan adopted was as follows: A drift of the usual form was run and heavily timbered, being well lagged overhead. The sets were placed five feet from center to center. As the work of excavating the drift proceeded, a triangular section was cut out of each side of the drift between the posts of the two adjoining sets. These two posts formed the base of a triangle, the apex being directly opposite the center of the base. At the apex a post was set, the center of which was three feet from the center line of the posts forming the base. Caps were placed reaching from the post at the apex to each of those of the base, and lagging driven in diagonally from the drift. The two sides of the triangular section opposite the base were lagged, a considerable space being left between the lagging to afford an opportunity for the soft swelling ground to force its way through the open spaces, when it is removed. These triangular spaces are continuous; that is, were cut opposite each set of the main drift. The method involved considerable extra expense in mining and timbering, but it was so infinitely superior to any plan previously tried that it was looked upon as a success mechanically and financially.

Drifts sometimes require but a few posts to support particular rock masses that threaten to fall. Where a post alone affords insufficient support, a heavy piece of plank (plate) is inserted between the top of the post and the roof.

Tunnels and shafts at times must pass through soft, running ground. Zones of rock of this description are often found lying between walls of firmer rock. The occurrence is not infrequent on the mother lode of California when the fissure is barren of quartz and filled with a mass of soft crushed foliated black slate. It is prominent in the Quaker City, Gwin, Hardenburg, Kennedy and many other mines on the lode. Such ground is nearly always wet, and the process of sinking or drifting in it is attended with expense and danger. In sinking through such ground the miners usually make an effort to push the work and pass through it as quickly as possible. When the ground is very wet and runs easily it is not always the best plan to "crowd" it. In some cases the difficulties are more easily overcome, the expense reduced and the completion of the task sooner accomplished by going slowly, allowing the ground to assume a more normal condition by cutting out and removing the material falling into or forced into the excavation. When water is troublesome in ground of this character, the better plan is to permit it to drain off. By so doing the ground sometimes becomes firmer, and, as a consequence, is more easily handled, timbers more readily placed in position, and the work carried on more satisfactorily.

Another kind of ground difficult to timber is found in some much altered rocks where talc, steatite (soapstone) and serpentine, containing much water, have to be passed through. The ground often breaks well and sometimes stands well for a time, but it is treacherous and should be promptly and substantially timbered. Rocks of this description are abundant in the great auriferous belt of California, and, as miners there well know, are usually fissured in every direction and upon exposure to the atmosphere exhibit a tendency to break up (called blocky ground). Great angular blocks and "heads" (round bowlders) drop from the roof and sides without warning. The former are often wedge-shaped and slip out from the fissured rocks when the ground had appeared firm and solid. The heads are usually hard in the center, while the outer portion is quite soft, feeling greasy to the touch. In size the masses range from an inch or two in diameter to those which weigh tons. Timber must be placed in ground like this immediately as the work progresses. The sets should not be more than 2½ feet from center to center, instead of the usual distance, 4 to 5 feet, whether it be in shaft or tunnel. Lagging, when used, must also be short.

When passing through slips or fissures, whether single or in zones, in any kind of rock, extraordinary precautions should be taken, as accident is much more likely to occur at such points than in solid, unfissured ground. Rock in the vicinity of veins is nearly always more dangerous than that at a distance from the vein.

(*To be continued.*)

Very Well Answered.

"A patent right. To charge eighteen times what a thing is worth."

Thus the term, "a patent right," is defined by *Puck*, and many people will smile over it and believe it to be an accurate definition. But, says the *American Machinist* of July 19, it is not accurate simply because no one can be compelled to pay anything whatever for a patented article. Anyone who chooses can go right on doing without the patented thing just as he did before it was invented, and he will do so unless convinced that the patented thing is worth more to him than the price asked for it.

It should not be forgotten that a real patent is simply a right to the exclusive control for a limited time of a thing actually created by the inventor—a thing in the possession of which he should be just as much protected as in the possession of a table or of a machine which he has made. A man by working two days produces a table, and when it is done it ought to be his to dispose of as he likes. If he has no use for it himself he may want to sell it, and if he does he has the privilege of charging what he likes for it, under the penalty of having it left useless on his hands if he charges more than it is worth. A man who works a year or more, perhaps, studying, experimenting and working, produces a machine which will accomplish things not before possible of accomplishment. If these things are not desirable to others then nothing will be paid for their accomplishment nor for the machine, and the inventor will be unpaid.

A Prehistoric Diamond Mine.

Exploitation, writes a correspondent of the Leeds *Mercury*, in what appears to have been a prehistoric diamond mine, recently discovered near Winburg, in the Orange Free State, has disclosed some curious and interesting circumstances. The shaft is almost perpendicular, and at the bottom, 150 feet from the surface, workings or tunnels branch off a distance of several hundred feet, much after the fashion of an English coal mine. The ground in the workings is diamondiferous, and many small gems have been found in the recovered debris. Appearances indicate that the mine had been worked secretly, and that the miners were armed, for old-fashioned spears and battle axes have been found side by side with primitive tools and skeletons of men, who must have been much above the average stature of any race of the present day: Stones, bearing inscriptions in curious characters, have also been found. It is yet a matter of conjecture as to what race worked these old diamond mines. The natives of the country have not even a legend or tradition regarding them. During the past few months there has been great activity in prospecting for new diamond mines in South Africa, and by last mail there is the official announcement by the Free State Government of the discovery, near Bloemfontein, of what appears to be a remarkably rich and promising spot. It has long been the theory of old diggers that diamonds are distributed over a wide area in South Africa.

An Index of Greatness.

We wish our Eastern friends would try to understand that it is only through the mines of the earth and through the skill shown in manipulating the metals that a nation ever becomes great. The miner is the most important citizen of any country. There is no country so barbarous, except among the most savage tribes, that the people have not a little skill in agriculture. They plant their fields, gather their crops and eat their food, but they make no advancement from age to age until they learn to go below the surface to bring up the metals, to reduce those metals and acquire the skill to put them in such forms of commerce as will command the patronage of the world. The act of doing that causes the mind to begin to expand until when the first rude sword is fashioned in a nation the possibility of a steel bridge or a steel ship is all made clear. We wish our Eastern friends to make a note of the fact that this country has advanced just as much as its people have learned to work the metals, and its further advancement will be shown as by an almost perfect indicator, through the further advancement that may be made in the same line.—Salt Lake Tribune.

The North Star on Sultan mountain, Col., has an almost phenomenal record in the respect that it has not shut down a day in eleven years. During that time it has shipped 25,000 tons of ore and 5,000 tons of concentrates, which produced 2,000,000 ounces of silver, 10,000 ounces of gold and 8,000 tons of lead. The average value of the ore in gold, silver, lead and copper is $65 a ton.

In making contracts with the iron and steel manufacturers this year, the Amalgamated Association officials have agreed that if tariff rates on sheet-iron and steel are made lower than those mentioned in the new bill as it passed the Senate, another conference is to be held and the scale question reopened.

Including "Fertilizers."

A Wall-street geutleman named Converse Clemeut, finding the midsummer dullness unprofitable, has visions of wealth, and has written to the Secretary of War for a permit to "dredge and bring ashore large quantities of black sand at various points on the coast between San Francisco aud the British possessions, particularly at Grays Harbor and points on Puget Sound, to extract valuable minerals from aud work residue into fertilizers." It is the opportuuity of his life. He wou't even need to "dredge" it, or "bring it ashore." It's ashore already, safely landed, and ean't get away. Nor will he need a permit. He will have the freedom of the entire beach from the sunny shores of Califoruia to where the free American of Alaskan descent bathes his barbarian brow in the surf that thunders on the shore of far Attou. The saud is strewn along the coast for several thousand miles, and contains gold that would make it worth even a Wall-street man's while to gather in. The trick is to separate it at a profit. A good many have tried it. The Secretary of War has referred Mr. Clement to the United States eugineers at Portland, Oregon. That he will be given permission can hardly be doubted, though he will do well not to expeet too much from the Government in the matter. His idea of working what is left after extracting the gold into fertilizers is seopy. Though the ordiuary effort has been to get the gold from the chemical embraee of the blaek sand, caring littlc for the residue, yet the idea of the Wall-street man is uot to be treated ligbtly. It may be that as brilliant a future awaits the man who can make the gold beaeh sand available for fertilizing purposes, as awaits him who can sueeessfully separate and keep separate the minute gold disseminated throngh that maguetie mass of silex.

But "art is long and time is fleeting," and it is likely that Mr. Clemeut, should he go ahead with his notion, will find an ordinary lifetime no more than sufficient to develop a portion of his auriferous scheme. The "fertilizing" part of the project is dimly remote.

THE American Medical Association had a meeting reeeutly at Oakland, at wbieh Dr. E. H. Woolsey read a paper on electro-therapeutics. The application of eleetricity to the restoration of health or the curing of disease is a favorite subject with eclectic physicians, but by reason of the increase of empiric attempts, is uot given as much discussion in a scientific way as its importance demands. Dr. Woolsey's paper was in every way au admirable one and deserves wider recognition than it appears to have received. The logical conclusion of his argument is that, while electricity is of manifest benefit in the treatment of diseasc. yet its potency renders it daugerous in the hands of even the most skillful—how much more so in the hands of the ignorant praetitioner. He detailed the processes and results of elaborate experiments covering a period of six mouths on differeut subjeets with currents of varying intensity, and while careful to avoid being positive in the expression of opinion, he made evidcnt the fact that electricity as a therapeutic agent is as capable of causing as eliminating disease. He clearly demonstrated that no one should allow a physician, "electric" or otherwise, to practice upon him with the electric current unless thorougbly satisfied that he understood what he was about, aud that it is the height of folly to permit a quack or charlatan to administer "electrieity" iu auy case of siekness or disease. Dr. Woolsey's paper may have the salutary effect of checking the destructive zeal of some "eleetric" doctors who would rush in where others fear to tread.

THERE is no war between the great Montana copper producers, uor any combination to restriet the output. It is understood, however, that a combine is on hand between the Boston companies and the Anaeonda, the amount of output to each produeer to be on the proportional basis of that previously produced, and as each is anxious for a high relative place in the proposed combine, they are now producing as much as possible.

AUSTRALIA mined 4,037,929 tons of coal last year. The supply is apparently inexhaustible.

Land Bill Passed.

Congressman Caminetti's bill iu regard to entries of land passed the House last Wednesday. As heretofore noticed, tbe intent of the bill is to save those making entries the delay, trouble and expense of appearing before United States registers and receivers by allowing entrymen to swear to tbe required affidavits before any duly authorized State or Territorial officer.

The part of the law most immediately important to miners is the section which establishes a rule of procedure in all cases where eontest arises as to whether the land in dispute is miueral or agricultural. The Secretary of the Interior and Commissioner-Gencral of the Land Offiee wrote to the House Committee commendiug tbe bill. The former wrote:

"I would suggest that tbe proviso be amended so as to read as follows: Provided that the presence of rock-bearing gold, silver, ciunabar or other valuable deposits of minerals shall be regarded as prima facie evidence that the land eontaining the same is and always has been miueral in eharacter; provided further that in investigating the character of the land, with a view to ascertaining whether it is more valuable for mineral tban agricultural purposes, evidence may be taken of the mineral diseovered or developed adjacent to such land, proof of which shall be corroborative evidence that the laud in question is mineral iu ebaracter; provided further that notbing herein contained shall affect auy pending coutest, and provided further that, except in Utah, wherever land is proven to be within a well-defined mineral belt it shall be prima facie evidence of the mineral character of such land uutil the eontrary is proved."

The bill. as passed by the House, practically complies with those suggestions.

This Will Do.

A good many inquiries are being received at this office as to the proper form for the required notice to be filed with the recorder in compliance with the provisions of the assessment suspension law recently passed by Congress. The following, it is believed, will meet the general requirements:

NOTICE.

To Whom It May Concern:—Notice is hereby given that .....the undersigned, owner..and holder.. of the..... .....miuing claim.., situated in the.....mining district, in the county of....., State of....., being desirous of taking the benefit of the Act of Congress, entitled "An Act to Amend Section 2324 of the Revised Statutes of the United States," relating to mining claims, approved July 18th, 1894, do hereby declare that....in good faith intend to hold and work said mining claim...

Witness.....hand...at....., County of....., State of....., this. .....day of....., 1894.

Signed, ...

.....

.....

Information Wanted.

TO THE EDITOR:—May I avail myself of your colnmns in order to make a request of sueb of your readers as are interested in stamp-milling to furnish me with some data regarding tbe stamp mills first ereeted in California. Tbe letter of Mr. Stanford, appearing in tbe MINING AND SCIENTIFIC PRESS of Oct. 21, '93, gives valnable information, but I desire, if possible, to obtaiu further partieulars regarding the mills whieh were first built in tbe State—more partieularly a drawing or detailed description of some pioneer plant. Respectfully,

Rico, Colorado, Aug. 1, 1894. T. A. RICKARD.

Don't be Hoggish.

We learn that there are three or four mining experts in this city at present who are in search of mining properties for companies and men of means. We presume that they are after both developed and undeveloped properites and if any can be secured reasouably they will doubtless take them. People who have claims to sell or bond and are approached by men of this kind should not expect to become Mackays or Floods in a day and demand exorbitant prices for them, but should have some eonsideration for others. A man, no matter how rich he may be, does not care to sink his fortune in the first bole in the ground he eomes across, and possessors of properties should not expect him to do so. It takes money to develop a mine as it should be developed, and any one who is lucky enough to have one and is met by these men should not hesitate in disposing of it if given an opportuuity. The quieker the people begin to realize this and give the capitalists a fair chance to open up the many properties that are undeveloped in this county the better it will be for our people and the State at large.—Nevada City Transcript.

Mexican Coal in the United States.

It is the general impression tbat no coal is mined in Mexico. This is a mistake. The fact is that Mexico sends coal to the United States. It is not sent in large quantities, but a considerable portion of the output of the mines at Sabinas, Sau Felisse, Hondo and Alamo is sent to the Uuited States over the Mexican International Railroad, and euters through the port of Piedras Negras. Nevertheless, the railroads of Mexico get much of their coal supply from England. When tbe rate of exchange is too high, they burn wood. Most of the eoal measures so far found are near the uortheru boundary, and the cost of transportation to the interior is greater than the ocean and rail cost from England. The Mexican National, a narrow gauge road from Laredo, Texas, to Mexico City, gets mueh of its supply from its own mines in the State of Neuva Leon. Tbe difficulty of mining the poor qnality of tbe product, and the lack of transportation facilities, have delayed and even stopped operation in the eoal fields of some districts. The most valuable coal mines yet found in Mexico are near San Marcial, along the Gulf of California, extending north to the Arizona line. The coal from this region is all anthracite or semi-antbracite. An English eompany was granted a eoneession of 4,000,000 acres in the district, but failing to comply with tbe agreements, the coneession was given to a Mexiean compauy.

Before the end of the present year the eoal output from the Fuente, Mexico, mines will be not less than 1,000 tons per day, tbe greater part of whieh will find a market in the Uuited States. On account of the thiekness of thc coal seam, thc cbaraeter of the roofing, which requires but little expense for supports, and the absenee of water or dangerous gases, this coal can bc mined with the eheap Mexican labor at a cost not exceeding 50 cents per ton. The coal gives good satisfaction on locomotives and stationary engines and being rich in volatile matter, will prove a valuable gas coal.

Cinnabar Mountain.

The Kennedy, Nev., *New Era* says: The early prospectors who visited this then remote portion of the world in search of silver in white quartz mistook the red oxide float to be eiunabar, never dreaming of the precious gold therein associated, and thus the towering peak which overlooks the destines of this toiling multitude bears the misnomer to this day. The "one-idea" prospector of thirty years ago has learned to look for gold. not only in glittering erystals, but in every form and hue of rock, until now they tell you "gold is wbere you find it." The cinnabar-like rock of Kennedy is gold associated with iron rust, commonly speaking, in a free state.

Apropos of this short dissertation on the mistaken ideas of years gone by,we reeall the history of the White Pine excitement, when thousands wended thier way to that great silver excitement. Nearly all the travel was through the canyon in whieh the town of Ely is situated, and half-way up the defile in the mouutain range, wagons rolled and pedestrians trod over an immense red oxide ledge that crossed the canyon and made on eaeh side into cliffs of the same character. No attention was given the rock, for it had not the characteristics of the quartz of California or Virginia City, or the ruby of Austiu. Four years ago an inquisitive prospector had a sample of tbe ore assayed, which act lead to the location of the Joanna aud Chainman group of gold mines, considered by many the most promising mines on the Coast.

As Viewed In South Dakota.

It is a remarkable fact, and one to be regretted, that the Americau people, with all their push and enterprise, should allow foreigners to open up their mountains and carry away the gold. More than one English syndicate has representatives in the United States now for the pnrpose of buying gold properties. Tbis ean, however, be accounted for by the senseless prejudice which exists in the minds of the majority of the American people against mining for preeious metals—a prejudiee not shared by any other people, and one that would be eliminated if they would only stop to investigate. If it is not eliminated, foreign syndicates will own more and more of our mines, and the gold that should enrieh the United States and its citizens, will go to Europe in dividends. To permit our precious metals to be mined aud owned by foreigners shows a lack of patriotism, as well as business sagacity, on the part of our people. It proves, though, that our Euglisb cousins appreciate a good thing, and it makes no differenee to the ever hopefnl, hardy prospector, to whom he sells the fruit of his toil.—Dakota Times.

Gold Ore Treatment at the Randt.*

The Witwatersrand gold fields are situated on one of the highest points of the South African plateau, some parts of the main reef being 5,000 ft. above sea level. It is worthy of note that on this account air compressors have to be made some 25 per cent larger than they would need to be on the coast. Johannesburg, which is only about six years old, now contains some 30,000 white inhabitants, whilst the mines employ 21,000 native laborers. It is only the discovery of coal in close proximity to the goldfields that has made the present great development of these latter possible. The cost of transport of fuel is, however, still high, owing largely to the refusal of the local railways to carry coal in bulk. It now costs about 22s per ton delivered at the gold mines. It only yields a very inferior coke, so that this article has to be imported for assaying and smelting, imported English coke being worth about £14 per ton.

The ore is different from any known elsewhere; it consists of pebbles of quartz held together by a siliceous cement, which contains in the lowest levels crystals of iron pyrites. At the surface the pyrites were oxidized and the ore was more friable, but the greater the depth attained the higher the percentage of pyrites appears to be. The gold is contained in the cementing material; it is so fine as to be scarcely ever visible to the eye, and much of it is combined with sulphides of the base metals, which latter are known as "sulphurets."

The ore when mined is hoisted up by means of head gears, which are seen dotted in all directions over the area covered by the goldfields. They are of two types. The first is a simple head gear, which delivers the ore into trucks, which are then run into the mill-building where the ore is dumped into a "grizzly" made of bars of iron, and then passes into a rock breaker, from which it falls into a hopper to go to the stamp mill. As the country is very flat, and the mills are often some distance from the mines, it was found more economical not to have the rock breaker in the mill building, but rather to place it on the head gear, and most modern head gears are so constructed. Rock breakers are either of the well-known Blake or of the Gates' or Comet type. In these the ore is broken down to about 2 in. cube.

The mills are of the usual California pattern, with self-feeders. Their weight used to be 850 to 900 lbs, and they used to have 1,200 lb. stamps, and are worked with an 8 in. drop; some of these modern mills run as fast as 92 drops per minute. In consequence of having such powerful mills, the best are able to crush 4½ to 5 tons per 24 hours per head, through a 900 mesh screen. The average for the entire goldfields for the month of December last was 3.7 tons crushed per head per 24 hours.

The batteries have amalgamated copper plates inside them, and the crushed ore is discharged on to copper tables 12 feet long and 6 feet wide, these tables being amalgamated so as to catch the gold. It is found that most of the gold is caught inside the battery, and on the first three feet of the outside copper plates. The amount of gold caught on the plates is 55 to 60 per cent, an amount which compares unfavorably with many other plates where the percentage is said to be 80 to 90. The amalgam is collected and is cleaned in pans and then heated in retorts, when the mercury is driven off and recondensed; the spongy gold so obtained is then melted. The loss of mercury in the entire treatment is about three-fourths ounce per ton of ore; at the Robinson mine it is 0.65 ounce. The melted gold is usually 800 to 825 fine. It contains silver, lead, copper and other base metals.

After the pulp has passed over the plates it is run into concentrators, which extract the sulphurets. There are various kinds of concentrators used, but the Frue vanner is the most popular. The percentage of concentrates obtained is about 3, and these sulphurets assay from 5 to 8 ounces of gold to the ton. Most of the mines sell their concentrates to one of the two chlorination works on these gold fields, the price given being 90 per cent of the assay value, less £4 per ton. In the chlorination process 95 per cent of the gold contents of the ore is extracted. This process is, however, only suitable for rich material; it is not, like the cyanide process, suitable for poor-grade stuff, such as are the tailings.

The concentrates are roasted in reverberatory furnaces, this being the most important part of the whole operation. The roasted stuff is then damped till it contains six per cent of moisture, and charged into vats furnished with covers fitting gas-tight. Chlorine gas is then passed upwards through the roasted ore; this combines with the gold, forming soluble chloride of gold, which is then washed out, the solution being filtered off and the gold precipitated from the solution by means of sulphate of iron, which is made on the spot. The process is costly, owing to the high price of sulphuric acid, which costs £25 per ton. The consumption of acid is 300 to 400 tons per annum.

After the pulp leaves the concentrators it is run into dams, where the tailings are allowed to settle. These tailings constitute about sixty per cent of the ore, the remaining forty per cent forming the slimes, which are run to waste and are totally lost. The tailings contain six dwt. to seven dwt. of gold to the ton, and the slimes four dwt. to five dwt. The tailings are charged by hand into huge vats, the largest holding 400 tons. Then a solution of cyanide of potassium is allowed to flow through them. Some mines employ a system of repeated percolations of this solution, while others object to it. A strong and a weak solution are employed, the first containing from 0.6 to 0.3 per cent, and the second from 0.3 to 0.1 per cent of cyanide. The whole tendency recently is to work with very weak solutions. Each solution is allowed to act from between twelve and eighteen hours, and is then run off into zinc boxes, where the gold is thrown down by means of zinc shavings.

Theoretically, 100 ozs. of gold should be dissolved by 4.3 lbs. of cyanide, but in practice 300 lbs. of cyanide are required. Some mines consume as much as 2 lbs. of potassic cyanide for each ton of ore treated. The zinc precipitates the gold from the solution, forming a mass of so-called zinc residues, which contains a very great deal of zinc and other impurities. The zinc residues are calcined, and then melted with a mixture of carbonate of soda, borax and fluorspar, when gold is obtained 720 to 750 fine, the principal impurity being lead. There appears to be no difficulty in refining this gold, which is very brittle. The average extraction of gold by the above process in 1893 was 14 dwt. per ton, the assay value being about 15 dwt. 8 gr. per ton.

* Abstract of paper by Mr. H. De Mosenthal on "The Treatment of Gold Ore at the Witwatersrand Gold Fields," read by the Chemical Society (London).

To Tap the Central Heat of the Earth.

Engineering Magazine says that the ingenious idea of obtaining an unlimited supply of heat for the generation of power by boring a deep hole and so tapping the central heat of the earth, assuming the correctness of theory of the existence of a central heat, has recently had some additional data furnished upon which to base further calculations. The deep bore hole at Wheeling, W. Va., shows a temperature of 135 deg. F. at a depth of 5,000 feet, the increase in temperature during the lower part of the bore being about 1 deg. for every 75 feet of depth. This was a more rapid increase than appeared at less depths; but assuming this rate to be uniformly continued, it would require a depth of about 3½ miles to obtain a temperature equal to that of steam at 100 pounds pressure. Just what results might be obtained in volcanic countries does not appear, but surely in such regions steam ought to be pronounceable by natural sources of heat much nearer the surface. After setting Niagara at work it may be next in order to impress into service either the geysers of the Yellowstone or even Vesuvius himself, and long before the available coal supply is exhausted we may be drawing from natural sources of energy beside which the already paling brilliancy of natural gas shall be as the flickering tallow candle of past days.

The Fascination of Prospecting.

Prospecting is a fever—a mania—which grows on one as does the habit of gambling, which it resembles, both being games of chance. The "knack at hoping" and the excitement induced by the hope—keeps alive many men to-day whose hair and beard are as white as the snow on the mountains. Once a prospector, always a prospector, unless a strike is made that will keep the lucky one in affluence the balance of his days. Then, ofttimes the riches from one mine but serve to dig unprofitable holes in the ground, of which the only product is hope. And then one lucky strike—one man made rich in a few months! How many men does it cause to shoulder a pick and shovel, tramp all day over the mountains, sleep on the hard cold ground at night and eke out a precarious existence as a prospector? It is seldom that the man who discovers the mine makes the money. It is the man with the silver and gold in his pocket who comes afterward. In ninety-nine cases out of one hundred the man who makes the money is not the man who "hoofed" it into a new mining country but the man who, a few years later, rides into town in a palace car. Few prospectors get rich—fewer save their riches. The prospector's life is not an easy one—'tis simply a happy one.—Ex.

Reduction in Salaries.

According to the Carson *Tribune* the following reductions have been made in the salaries of mint officials:

Superintendent, from $3000 to $2500.
Melter and refiner, from $2500 to $2000.
Assayer, from $2500 to $2000.
Assistant assayer, from $2000 to $1500.
Assistant melter and refiner, from $2000 to $1500.
Chief clerk, from $2250 to $1800.
Cashier $2000. No reduction.
Bookkeeper, from $2000 to $1500.
Weigh clerk, from $2000 to $1500.
Appropriation for labor from $50,000 to $15,000.
Appropriation for incidentals and contingent expenses, from $25,000 to $7500.

Patent--Uncompleted Invention.

The Court of Appeals of the District of Columbia held, in the recent case of Coffee et al. vs. Guerrant, reported in the Washington *Law Reporter*, that where from the date of the first application until the date of the application for an invention in its final form the machine on which both applications were based was preserved and in use, either partly or wholly dismantled or entirely assembled for the purpose of obtaining a patent, and with a view to its mechanical perfection for the actual commercial use, such machine did not present the case of a dismantled and abandoned experiment recalled to memory by the successful effort of a later inventor. The court said that "a perfect invention does not necessarily mean a perfectly constructed machine, but one so constructed as to embody all the essential elements of the invention in a form that would make them practical and operative, so as to accomplish the result in a reasonably practical way." The machine involved in this case was a tobacco stemming machine which was set up in a tobacco factory at Danville, Va., a great tobacco manufacturing place. It was operated by hand, and also by steam power, at different times within a short period, and in the presence of a number of people. When fed with the tobacco leaves, prepared for stemming, it performed fairly satisfactory work. But few leaves passed the blades without having the stems properly removed. The court took the view from the evidence that the machine was something more than an unsuccessful experiment, and that it was in fact a reasonably successful reduction of the invention to practice.

Patent Office Records--Evidence.

The Circuit Court of Appeals for the Second Circuit held, in the recent case of The Mayor of New York City et al. vs. American Cable Railway Company, that certified copies of the Patent Office record of instruments purporting to be assignments are not prima facie proof of the execution or genuineness of the instruments. The court (per Wallace, C. J.) said: "The assignment of a patent is not a public document, but is merely a private writing. There is no statutory provisions requiring it to be recorded in the Patent Office. Section 4898 of the Revised Statutes permits this to be done for the protection of the assignee against subsequent bona fide purchaser or mortagagee. The section does not make the recorded instrument evidence, does not require the assignment to be executed in the presence of any public officer, or to be acknowledged or authenticated in any way before recording, or does not provide or contemplate that it shall remain subsequently in the custody of the office. It devolves upon the Patent Office merely the clerical duty of recording any instrument which purports to be the assignment of a patent. We are aware of no principle which gives to such a record the effect of primary evidence, or prima facie proof of the execution of the genuineness of the original document."

Is Not Buried.

Nothing is useless nowadays—not even a defunct pauper. The poorhouse guardians know better than to act recklessly: often the panper is the possessor of a set of artificial teeth which contains a good deal of gold—last relic of more prosperous times—and in the interest of the ratepayers the precious metal must be secured and turned into £ s. d. Often, too, they are the owners of rings or tiny trinkets, not pawnable, but still containing as much auriferous value as not a few modern gold mines. These have to be collected and also converted into cash by means of a melting pot. In the Holborn Union the melting process takes place once a year, and has just been accomplished for the present season. The jewelry dealt with is what is found on paupers who died friendless and unclaimed in its various establishments. This week rings, chains, brooches and trinkets have been melted down, and produced a bar of gold, estimated as 11 carat, and worth about £40. A good proportion of it was got from the plates of artificial teeth. Mr. Walton said that on one set of artificial teeth there was at least £4 worth of gold. The proceeds are paid into the common exchequer of the union.—English Ex.

Total Production of Gold and Silver.

M. Edmond Thery, director of the Economiste Europeen, "states that the whole production of all the mines in the world, from the discovery of America in 1492 to the year 1892, inclusive, amounts to 233,950 tons of silver, representing, at the present nominal value of that metal, 51,936,000,000 francs, or £2,077,440,000, and 12,358,932 kilograms of gold, representing 42,564,000,000 francs, or £1,702,460,000, making a total of 94,500,000,000 francs, or £3,780,000,000. The total quantity of gold would form a cube of 8.62 meters side, and a base of 74.3 square meters area. With the same base the 22,280 cubic meters of silver already extracted would form a solid column of 300 meters height, exactly equal to that of the Eiffel tower."

Scientific Progress.

The Storage Battery of the Air.

The air will stand a strain of abont 9,600 grains per sqnare foot before breaking. That is, the flash will occnr when the eleetrieal pull amouuts to this, 1.37 pounds per square foot. For the energy of a cubic mile of strained air just before the flash we have; then, about 70,000,000 foot tons. The average thunder head or cumnlo-nimbus cloud is not a mile high, however. For a small cloud, one hundred yards square, and distant only a quarter of a mile, we wonld get about 300 horse power. Now a flash even a quarter of a mile means a potential of many million volts. We cannot at present measure this directly, but we can determine the potential of the air within certain limits on any day, thunderstorm or no thunderstorm. In 1885, at Blne Hill Observatory, and in subseqnent years, says A. M'Adie in *Harper's Magazine*, we measured the potential of the air with insnlated water-dropping eollectors, after the methods of Thompson (now Kelvin) and Mascart. The top of the hill is 600 feet above the surrounding country; bnt with Franklin's idea of reaching out a little farther than the earth, I ventnred to use at times a large kite, tin-foiled, and for kite string some 500 feet of hemp fish line wrapped abont with fine nncovered copper wire. Dnring thunderstorms the sparkling and sizzling at the electrometer and of the kite string were incessant and startling. And even on cloudless days I fonnd it possible to draw sparks, reading at the same time on the electrometer from minute to minnte the electrification of the air in volts. In 1886 and 1887, in some investigations carried on by the Chief Signal Officer, and more immediately under the snpervision of Professor Mendenhall, I experimented at the top of the Washington Monument, at that time the highest edifice in the world. The investigation continued many months, but perhaps days on which severe thnnderstorms occnrred were most impressive.

It being beyond dispnte, then, that high potentials can be obtained from the air. the question naturally ensuing is, Can we not use them? With three or four sparks as small as those mentioned above, a large fruit jar can be cleared of smoke with which it has previously been filled. Perhaps nature repeats this on a large scale with lightning and clarifies a foul dnst-laden atmosphere with these great sparks. It may be, too, that these flashes are all needed, and to attempt to divert them may be unwise. Be that as it may, we are living in an age of "step-np" and "step-down" transformers; an age when, for the first time in centnries, we are perilonsly near duplicating lightning. Until recently we stndied lightning only in miniatnre. Prof. Elihu Thomson was kind enough to show me in his Lynn laboratory, two summers ago, some of his larger home-made lightning Indeed, potentials of 100,000 volts are less rare to-day than potentials of 5,000 volts were five years ago. All who saw the Thomson aud Tesla exhibits at the Electrical building, Chicago, will easily believe that it is within our power to tnrn the fleeting high-potential lightning into a cnrrent of lower potential and nse it.

Professor Trowbridge, of Harvard University, in a discussion of some photographic negatives, shows that "the discharge follows exactly the same path in air for three hnndred thousandths of a second," and adds that "it is probable that an ordinary discharge of lightning of a few hnndred feet in length could light for an instant many thonsand incandescent lamps if it were properly transfromed by means of a step-down transformer." The eye alone cannot give a complete history of the myriad minor flashes dnring a thnnderstorm. The charred, though to ns intensely brilliant, crack in the air which we call lightning is bnt a great splash in the ether ocean. The waves and ripples come tumbling along in all directions, spreading rapidly, aye, very rapidly, nearly 200,000 miles per second. Given a proper resonator, and the waves will do work. If my reader keep every sense on the alert, he may happen on some strange illnstration of work done by lightning, now all nnsuspected. In the tinkliug of the telephone bell, the blinking of an incandescent lamp, the melting of a fnse, or the tiny spark from a gas pipe or loose wire, is the constant proof that there are more things going on between heaven and earth duriug a thunderstorm than most of ns dream of in our philosophy.

A Few Telephone Figures.

There are now in operation in the United States alone more than half a million miles of telephone line, bringing into speaking relations over 250,000 telephonic snbscribers, and employing in daily service over 600,000 telephones, by means of which 600,000,000 messages are transmitted annually. These figures, given on the anthority of Mr. Arthur V. Abbott of the Chicago Telephone Company, most graphically portray the remarkable proportions which Prof. Bell's invention has assumed. The earliest application of the telephone necessitated a wire extending from each station to every other one with whieh communication was desired. How practicable a method this is, however, for covering a territory of any magnitnde can be seen without much difficnlty. In both New York and Chicago, for example, about 10,000 subscribers have telephonic commuuication. The most compact system of nndergrond circnits needs abont four sqnare inches for every 100 lines, so that, to nnite each of the 10,000 snbscribers with the remaining 9999 would require a space of more than a yard sqnare simply to contain the necessary conductors. No present city street could afford the required room for the snbways. If communication were thns attempted, each subscriber, according to Mr. Abbott's figures, wonld require nearly 200 miles of cable, and should the distribntion be nndertaken by means of aeriel wires, pole lines 1000 feet high would be reqnired to accommodate the necessary circnits. It is to the impossible complexity of such a system, which became apparent even in the earliest telephonic days, that the telephone central station and the telephone switchboard owe their origin and development, aecomplishing to-day resnlts whose convenience and importance are all bnt lost sight of in the bnsy whirl of existence. and can perhaps be best appreciated only by comparison with the meagre telephone facilities of a dozen years ago.—Cassier's Magazine for August.

Paper Telegraph Poles.

Paper telegraph poles are the latest development of the art of making paper nseful. These poles are made of paper pulp, in which borax, tallow, etc., are mixed in small qnantities. The pulp is cast in a mold, with a core in the center, forming a hollow rod of the desired length, the cross-pieces being held by the key-shaped wooden pieces driven in on either side of the pole. The paper poles are said to be lighter and stronger than those of wood, and to be nnaffected by sun, rain, dampness, or any of the other canses which shorten the life of a wooden pole.

Electricity Underground.

Electricity is now used in 300 mines in the United States, and proprietors of perhaps as many others are considering its ntilization. It presents a system of the greatest simplicity, completeness and flexibility, permitting power from one sonrce to be distribnted in nnits of any desired size and for any purpose to the places where it can be employed to the greatest advantage, thereby secnring the minimum cousumption of power and expenditure of labor. With electricity there is neither friction, heat nor condensation. There is no leakage nor loss of power when not in nse, whieh espeeially recommends it for intermittent work.

The *Electrical Review* says the Railway Ammonia Motor Company has recently had bnilt at the works of the De La Vergne Refrigerating Machine Company, in New York, a motor car upon its system, and a trial took place at the Da La Vergne works recently. The car is abont the size of an ordinary horse or trolley car, and abont one-half of its space is occnpied by the motor. Anhydrous ammonia in this car is charged in a reservoir, which is snrrounded by a tank filled with hot water. From the reservoir it passes into the cylinder, where it acts on the piston precisely as steam does. The exhaust from the cylinder is conveyed into the water tank. where the ammonia is condensed, and can afterward be recovered, the inventors claim, with very small loss. In the trial the reservoir was charged until the pressure was about 150 pounds, and the car was rnn about a mile backward and forward before the pressure ran down to 100 ponnds.

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.

Gold and Silver Refinery
—AND—
Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

Also Manufacturers of
STANDARD SHOT-GUN CARTRIDGES,
Under Chamberlin Patent.

HEALD'S
Business College,
24 Post Street, - - - San Francisco.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

A LARGE, VALUABLE
Gold Mining Property
FOR SALE CHEAP.

A GRAND OPPORTUNITY NOT EASILY DUPLICATED. Actual value many times the price asked.
Situated in Nevada County, California, and consists of a group of four mines, all strong, heavy veins. Only partially developed. Ore free milling. Over $90,000 past yield of ore from one mine alone.
Must be sold within 30 days to close out an estate. Price, $30,000. Terms, $5000 cash; balance easy installments, or 20 per cent of gross proceeds, to suit purchaser.
Machinery on the ground worth cash payment asked. For prospectus and particulars, please address:
S. B. FOWLER,
Grass Valley ..... California.

TUBBS CORDAGE CO.
(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice.
611 and 613 FRONT ST., San Francisco, Cal.

QUICKSILVER!
—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
Room 1. - 426 California Street,
SAN FRANCISCO.

Professional Cards.

WM. GILBERT, B. S., Manager.
PRACTICAL ENGINEERING SCHOOL,
205 Goodnough B'ld'g, Portland, Or.
Civil, Electrical, Steam, Mining, Assaying.
Full charge of plant taught. Circular.

F. ORTON, Mechanical Engineer.
EXPERT DESIGNER of Special and General Machinery.
PREPARING PLANS of Steam, Air and Hydraulic Apparatus; Iron and Wood-Cutting Machines; Transmission of Power, Etc.
218 Mission St., San Francisco.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
728 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

Nevada Metallurgical Works,
No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.
C. A. LUCKHARDT, Manager.
Established 1869.
ORES WORKED BY ANY PROCESS.
Ores Sampled.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.

LIGHTNING LARGEST WELL MACHINERY Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Mechanical Progress.

Increasing Use of Oil as a Fuel.

According to *Indian Engineering*, the utilization of the heat force of oil as a fuel is increasing, the reduced price of petroleum, and the cheap carriage of it in tank steamers instead of barrels, greatly stimulating its use. As fuel for steam boilers at sea there are certain economies in the labor of stoking which encourages its use, but the choice depends on variable circumstances, such as the relative cost of oil and coal at any particular place, the certainty of finding a store of oil ready at ports of call, and finally, in the absence of risk in the storage and use of oil. At present it is only at places such as the Caspian sea, or on the Volga, where oil is cheap and coal very dear, that boilers are made for oil fuel exclusively.

The explosive force of vaporized oil, without the inconvenience and waste of steam boilers, is more immediately interesting to engineers. During the last twoor three years oil engines have been greatly improved, and are taking a more important position among motors which may be relied upon. Except in countries where import duties are imposed, the cost of petroleum has been brought down to a low price, and as the consumption in an oil engine only ranges from one-sixth of a gallon per effective horse power per hour, the oil motors are cheap as well as convenient. Not only as fixed machine, but as motors for lauuches and tram cars, oil engines are likely in the future to compete with steam and electric engines.

Making Tubes From Wood Pulp.

Metal may be broken up in pieces and melted together, and thus be as solid as ever. At first it does not seem as if wood could be treated in a similar manner with similar results; but such material, being ground as if for making paper, may be worked up into tubes which, when treated with asphaltum and other chemicals, are harder than the original spruce and poplar used in making them. The pulp is first wouud around a mold, which is removed when enough of the water has drained off; and the tube is then laid on other supports until thoroughly dry. After undergoing the other processes already referred to, it is trimmed and shaved at the ends, for fitting. Such pipes, with a diameter anywhere from one and one-half to twelve inches, may be made proof not only against water, but also acids aud alkalies. They also offer high resistance to electrieity, and therefore make admirable eonduits for telephone and light wires. The bursting streugth is from 150 to 250 pounds to the square inch. Of course they are combustible; but they can stand a temperature of 150 degrees without injury.

Greater Accuracy in Telephony.

Following the example set in Europe, several street railroad compauies in this country have begun to use the telephone instead of the telegraph for communicating between the divisiou superintendent and the stations on the line. The long-distance telephone is also being used for exeeutive business between railroad offieials in large cities. At a eonventiou of railway telegraph superintendeuts in Detroit a few weeks ago there was a discussion of the change. The principal objectiou in most minds grows out of the errors due to similarity iu sound between words of very different meaning. To obviate this it was suggested that telephonic operators in sendiug a message spell it out, letter by letter, instead of repeating it word by word, and, in receiving, to verify it in the same mauner. This, while not elimiuating all possible chance of mistake, would greatly reduce it, and yet take no more time. The ouly other objection of consequence is that the telephoue leaves no record. But this argument is met with the auswer that for at least half the business of a railroad telegraph line no record is required; and the registering apparatus of telegraphy has been out of use in this country for years, anyhow. It is alleged, moreover, that there is a distinct economy in the use of the telephone, as it requires less battery or dynamo current to work it.

Relative Strenght of Metal and Timber.

Prof. Robert H. Thurston, in a recent article discusses various materials in which comparisons of interest are made. At the outset he gives the following generally accepted figures: Cast iron weighs 444 lb. to the cubic foot and a 1 in. square bar will sustain a weight of 16,500 lb., bronze, weight 525 lbs., tenacity 36,000; wrought iron, weight 480, tenacity 50,000; hard "struck" steel, weight 490, tenacity 78,000; aluminum, weight 168, tenacity 26,000. We are accustomed to think of metals as being stronger than wood, and so they are, generally speaking, if only pieces of the same size be tested. But let equal weight of the two materials compared, and it will then be found that several varieties of wood will prove stouter than ordinary steel. A bar of pine just as heavy as a bar of steel an inch square will hold up 125,000 lb.; the best ash 175,000; and some hemloek 200,000 lb. Wood is bulky. It occupies 10 or 12 times the space of steel. The best steel castings made for the U. S. Navy have a tenaeity of 65,000 to 75,000 lb., to the square inch. Whitworth, by solidifying such castings uuder great pressure, got a tensile strength of 80,000 to 150,000 lb. By "drop-forging" no doubt this may soon be paralleled. We now get still better strength in small pieces. The best tool steel, from ingots, is far superior to steel castings and forgings in this respect, aud fiue steel wires and ribbons give a tenacity of 300,000 lb. to the square inch of cross section. Ordiuary aluminum is oue-third as heavy as steel, and a bar of the former, with a cross seetion of 3 square inches, would hold up 78,000 lb., and that is as much as 1 ineh of good steel would do. Various alloys have been made in whieh aluminum is the chief ingredieut, securing iuereased streugth without materially addiug to the weight. But Professor Thurston does not regard any of them uor any of the numerous bronzes as well adapted as steel. Still at the time of this writing he may not have seen the recent statement of Alfred E. Huut, president of the Pittsburg Reduction Company, that, by adding a low perceutage of "hardening iugredients" and rolling, his works could produce alumiuum plate with a teuaeity of 40,000 to 45,000 lb., without materially affecting the weight. This would give a tensile strength, in a bar weighing as much as steel 1 in. square, of about 130,000 lb. It has been elsewhere stated, not over Mr. Hunt's signature, that his company produced alumiuum with a strength of 60,000 lb. to the ineh, which would be equivalent to steel giving a tenaeity of 175,000 lb.

ACCORDING to the Philadelphia *Times*, au American got a silver dollar in trade at Honkow, and attempted to pass it at the bank there. He was told it was not good, and upon his questioning the matter the Chinese cashier sent for a candle and lit it. He then held the coin over it, and lo! in a moment it began to melt. The sides fell off and in the center there was a piece of eopper. The counterfeiters had split a genuine coin and had hollowed out the two pieces on the inside so that the copper could be fitted into them. They were then patched together so neatly that ouly the experienced ear of the Chinese shroff could detect the fraud.

California Inventors Should consult DEWEY & CO. AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No. 230 Market St., San Francisco, Cal.

THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

DOUBLE-ACTING
Cornish ★ Plunger.

PUMPS TWICE AS MUCH WATER AS THE OLD PLUNGER. Only about one-third the weight of the old Plunger. Special construction of steel for packing on mules, only one-twelfth the weight of the ordinary Plunger. First outlay one-third less; works with 10 per cent loss power.
IMPROVED SINKING PUMP.—Bucket and clack changed under water. Bucket lasts six times as long as the old one, saving expense of putting down another pump where bucket and clack cannot be changed under water. The self-tightening and self-lubricating stuffing box and new bucket also saves expense of dropping extra pumps. WM. NANCE, Grass Valley, Nevada County, California.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 22 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies. Stamp Cam.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GENERAL MINING NEWS.—*Ledger:* Frederic F. Chisholm, of the Extension Mining Company, has men at work driving a prospecting tunnel on the property of his company in Plymouth.

The Clyde mine, the property of Aitken & Stevich, has hen sold to D. Jones as trustee for some Pennsylvania people. The price paid for the mine was $25,000.

Hicks, Chase & Freese of Pine Grove are mining on Clinton Bar, with good prospects. They are working thirteen men, using derricks to elevate the gravel to a point at which they can utilize water.

The Vandament claim in Pine Grove, by a mill test of fifty tons, has proved to contain $13 rock. Charles Denning is superintending the work for John Denning and Thomas Day of San Francisco.

The Gwin Mine Development Co. has received the machinery for the new hoist. They have a large force of men at work and the intention is to have the hoist completed by the 15th inst. The shaft is about a hundred feet deep now. C. O. Mitchell of Sutter Creek has commenced laying the pipe from the tank reservoir to the works. They have about 380 feet fall from the reservoir to the works.

I. R. Bearce, who, in company with C. Marelia, has been working the Amador View mine in Pioneer district, recently uncovered a fourteen-inch ledge on that property near the surface. They are going to continue taking out the rock and send it to a mill in the neighborhood to he crushed. The quartz will assay in the neighborhood of $100 per ton.

The New London mine, near Plymouth, which was honded by its owners, Messrs. Haynes, Matthews and Greenhayden to a promotor in the interests of an English company over a year ago, has been taken and the purchase price of $15,000 paid over. The superintendent for the present company, N. J. Coleman, is now working four-hour shifts, taking out the water preparatory to repairing and developing the property. They have purchased the hoist and rock-breaker of the Pacific mine and will move them to the New London as soon as possible.

MINE SOLD.—The Mahoney or Hector mine has been sold by E. C. Voorhees to the Wildman Mining Company.

THE GOOD HOPE MINE.—*Dispatch:* The Good Hope is located on the mother lode. The mine was incorporated several years ago with the intent of working it with local capital, hut there became a hitch with regard to how and by whom it should be managed, and the plan again came to a standstill. The corporation organized with 50,000 shares at the par value of $10 per share, 49,000 shares remaining in the hands of Chas. Peters, the original owner. He has had handsome offers for the property, hut would not drop a dollar from the high price he held it to be worth. R. H. Browning of El Dorado Springs, Mo., has bought 24,500 shares for $15,000. The remaining shares will he placed on the market. The old shaft of the mine, which was sunk twenty years ago to a depth of ahout 110 feet on the ledge, and shows excellent ore, which widened and grew richer as it went down, and at the hottom the vein is six feet wide of heavily sulphuretted ore, yielded, hy actual milling test of 20 tons, over $6 per ton in free gold alone. A drift has heen run at the 70-foot level a distance of 136 feet south, showing good pay rock with excellent gangue and well-defined walls the entire distance. A drift north at the same level is in forty feet in pay ledge matter all the way.

Butte.

BUTTE COUNTY MINES.—*Mercury:* At the Stow mine at Forbestown work has hegun on a tunnel a mile and a half helow the mine. It is proposed to tap the lowest level of the mine, affording an easy method of taking out the ore. Should the tunnel disclose as large a hody of ore as is expected, the mill will he moved down the canyon and largely increased.

The Shakspeare mill is now running on a sample lot of ore from the James Carlisle ledge on the South Feather. Mr. Carlisle, it is stated hy experts, has one of the largest and richest ledges ever discovered in the county. It is located in a deep canyon, where to huild a road would require a great outlay of money. Consequently, before going to this expense, and the additional one of huilding a mill, he desires to thoroughly sample the ore. An excellent trail has heen huilt from Forhestown to the mine, and over this Mr. Carlisle is now running a pack train of ten mules, transporting the ore in packs to the Shakespeare mill, where it is worked. The pack-train makes two trips a day, and will prohably carry two tons of ore. Upon the result of this test depends the erection of a mill.

Geo. Finch has recently discovered a hig ledge near Carlisle's, which he is engaged in developing. It prospects highly, and the ore hody is immense.

The Phœnix mine at Hurleton has resumed operations. The last cleanup at the mill resulted in hullion to the amount of over $8000, an average of $11 per ton on the ore crushed, hesides the sulphurets, which are now in process of reduction.

The last cleanup of the Golden Summit mine resulted in over $3000, which, for the amount of ore crushed, shows a high average, and the amount of rock in sight justified the statement that it is a most valuable property.

At Magalia N. D. Rideout is engaged in developing the famous Pershhaker mine. Boarding and lodging houses have been erected for the workingmen, and a force is engaged under J. C. Campbell, as superintendent, in sinking the shaft. Eastern capitalists are also looking at the Aurora mine, and active operations will he commenced shortly.

For some time the work of draiuing the Golden Feather River mine, ahove Oroville, has heen going on, and the elevators have ahout accomplished their work. Mining will shortly hegin.

El Dorado.

THE TAYLOR OR IDLEWILD MINE.—*Courier:* The Taylor mine (Idlewild), located three miles to southwest of Georgetown, contains not only the hest equipped forty-stamp mill and hoisting works in this and adjoining counties, hut one of the best in California. The entire works are lighted by electricity. The main shaft has reached a depth of over 600 feet. The water power is supplied by the California Water Co., operating the Pelton wheels under 300 or more feet pressure. The pulp, after passing heyond the concentrators, is so thoroughly rohbed of its gold that assays show only a perceptihle per cent.

Nevada.

IN THE HECLA.—Grass Valley *Telegraph:* Rock taken from the footwall of the Hecla (Kate Hays) mine at a depth of 125 feet shows well in free gold. The Hecla is situated in the vicinity of the W. Y. O. D., Pennsylvania and Rose Hill mines. It was worked in 1863 and the rock paid from $35 to $45 per ton without the sulphurets.

MILL STARTED.—*Tidings:* The new mill of the Gold Flat mine, or at least five stamps of it, started up Thursday and worked satisfactorily. There are about 300 tons of quartz on the dump to be crushed, and it is expected that this will yield a fair amount of the yellow metal.

MINING NOTES.—*Transcript:* The company now owning the Eagle Bird mine, in Washington district, have changed the name of the mine to the Oak Tree. It has of late been known as the Diamond D. The present company is having the mill put in thorough repair.

Cole & Williamson have arranged to bond their mine to Haywards & Co. of San Francisco. They have a ledge sixty feet wide, and the general character of the quartz is good. It is believed that if proper machinery was put up, so as to work the mine on a large scale, and at the same time economically, it would prove a hig investment.

The Spanish mine owners have men at work prospecting below the mill, with a view of moving the mill, as all the ground above has been worked out.

In Eureka district, D. Moore of Washington, C. D. Eastin of Eureka, and C. Bonnemort of Oakland are meeting with encouraging results at their mine. They have a good ledge of fine rock, and the ten-stamp mill is kept running steadily. The mine is situated below the National, toward the Middle Yuha river, and ahout four miles from the town of Graniteville.

NEW COPPER MINES.—Preparations are being made at Spenceville, this county, says the *Tidings*, to actively work the copper mines of that district. The mining claims formerly owned hy C. C. Bittner have been purchased hy a San Francisco company which has incorporated under the name of the Mineral Hill Gold, Silver and Copper Mining Company, and has purchased machinery for melting the ore. The ore will average from 8 to 10 per cent copper and varies in richness in gold and silver, which will prohably insure its successful operation. The company has contracted with J. W. Jackson for 500 tons of ore. The company is at present taking out ore and expects to have 700 tons ready for the furnace as soon as it is completed. The furnace has a daily capacity of 40 tons, and we can soon expect to see great activity in mining in this old camp. Tunnels are being run from the north fork of Dry creek, which will tap the several veins ahout 400 feet vertical and insure ahout 500 feet of backs. One of the tunnels will be over 1000 feet in length when completed.

Placer.

THE OSBORN-GAYLORD MINE.—*Herald:* Messrs. Osborn, Gaylord and Haskill have consolidated their mining claims on Rattlesnake and incorporated. Supt. Gaylord has had eight men working, and the tunnel is in about 500 feet, and the gravel (of a cement formation) is uncovered, ready for milling. Mr. Gaylord has heen in San Francisco this week, making arrangements for putting up a mill immediately. The prospect is good, and there is enough gravel uncovered to keep the mill running a year.

Siskiyou.

MINING NOTES.—*Union:* The Fernandez claim, on Cherry creek, is reported as paying exceedingly rich, as high as 100 ounces a week having heen realized.

The Spengler Bros. claim, at mouth of Humbug creek, is now paying handsomely, a rich bed of gravel having been found in the channel.

At the Beehe Bar mine, in Virginia Bar district, Klamath river, the work of hoisting pay gravel has heen commenced, and, although not yielding much pay yet, it is expected good returns will be secured when nearer the hottom of the channel, where the gold generally sinks down to the hedrock.

Murphy, Freeland & Co. have a fine ledge on Salmon river, which measures four feet in width and pays exceedingly rich.

The Hungry Hill quartz ledge on Know Nothing creek, in the Salmon river section, is a valuahle mining property. The mine was honded lately for $100,000, and the owners were delighted when the holders of the hond failed to close their bargain. The quartz from this ledge pays several hundred dollars per ton, and the property could not be purchased at present for $500,000.

Four prospectors have recently discovered a very valuahle six-foot lead of superior hituminous coal, not far from Sisson, which is likely to prove a honanza for the discoverers. It was tested at Sisson in a hlacksmith shop for heating iron, and found to he excellent, besides good for all other purposes. If, on further development, the lead continues to prove extensive, there will he no trouhle ahout huilding a hranch railroad to the locality, as good coal will always find a ready market at paying prices, and give employment to numerous men. It is thought that extensive coal leads exist in various portions of this county, and that coal mining may eventually hecome a leading industry.

The quartz mines on Humhug are now yielding handsomely, since the men are able to get down in the shafts without so much trouble from water, hy reason of the claims drying out under the influence of hot weather.

THE BLUE GRAVEL MINE.—*Journal:* The shaft on the Blue Gravel drift claim, 1¼ miles south of Yreka, at a depth of 110 feet encountered a gravel channel 200 feet wide. The owners have hreasted out ahout 300 feet in length hy from 60 to 70 feet in width of gravel, and realized $35,000 in gold. During the week preceding the date of the recent tie-up $1330 was taken out, which was the largest weekly cleanup in the history of the mine. A tunnel is heing run south from the shaft over raised rock, in the expectation of encountering at a distance of ahout 200 feet another or division chaunel.

NEVADA.

DE LAMAR'S BONANZAS.—James Healy, foreman of the properties of the De Lamar Gold Mining Company, Nevada, tells the *Tribune* that the Monitor, Jim Crow and others embraced in the De Lamar group, are the higgest things he has ever seen in the way of exclusively gold propositions. The properties, he reports, have been opened up through six tunnels, four of which have been driven since May last and entailed 2000 feet of development, which gives them a depth of 400 feet on the vein or 700 feet helow its apex. The most important disclosures in this period of development were in the tunnels on the Monitor, where 16 feet of ore in two distinct places in the vein shows a general average of $100 per ton, the balance of 40 feet between walls returning not less thau $15 a tou.

How to handle these ore hodies is the problem the company is undertaking to master. They must have water, and drills are now horing at a depth of 300 feet, while near a spring the company is sinking a shaft, six hy eight feet in the clear, in the hope of striking the underground watercourse from which the springs are fed.

At the same time a force of men is clearing the way for a mill. A tramway for the economical delivery of the ores is being constructed, and everything is being put in shape for the continuance of the production of gold from the honanzas.

Mr. Healy says he has satisfied himself that the property is on the same helt as that of the famous Raymond & Ely at Pioche which was worked to a depth of 1800 feet and is yet producing, and that it will be shown to contain riches just as permanent.

A telephone line has recently heen constructed hetween Pioche and the mine, 50 miles distant.

PERFECTING THE CYANIDE PROCESS.—Lovelock *New Era:* Not a word reaches the columns of the Nevada newspapers of an industry within its horders which in mining circles is of world-wide importance. William Willis hegan experimenting in Tuscarora with the cyanide process in extraction of precious metals from ores of that district, hut for some time was unsuccessful. The first discovery he made was to detect the escape of the precipitates from the zinc, wherehy, after forming in light flakes, they were washed into the tailings. This fault was remedied hy regulating the flow of the solution through the zinc hoxes, the flows having heen too strong. After many months of patient lahor, he succeeded in arriving at a formula, and arranging his plant so as to save 98 per cent of the assay value of the gold and silver in the rock he treats, and has caught 99½ per cent. To he able to extract the silver is a secret process known only to Mr. Willis. Every few weeks for months past he has shipped a bar of hullion, a fitting resultant of his wisdom and patience.

Washoe District.

ON THE COMSTOCK.—The following is condensed from superintendents' weekly reports:

In stoping out between the south drifts Nos. 2 and 3 in the ore hody recently found on the 1650 level of Con. Cal.-Virginia, on the west side and to the south and upward, extracted during the week 350 carloads of ore—about 347 tons—the average assay value of which, per mine car samples, was $57.37 per ton. The faces of the ore body in those directions continue to look well. Twenty-two feet below the south drift, No. 3, started at the end of the west crosscut on the 1700 level, has heen advanced 22 feet; total length, 36 feet. The last ten feet is in ore which will average $50 per ton, and the face of the drift is in ore which will average $60 per ton hy assay.

The south drift from the crosscut run west from the hottom of the winze, which was sunk 28 feet on the east side of the main drift on the 1000 level, 280 feet south from the shaft station, has heen extended 36 feet; total length, 48 feet, continuing in porphyry and quartz formation carrying a low assay value. The west crosscut started from the main drift, 345 feet south from the shaft station, has been advanced 30 feet; total length, 130 feet, continuing in porphyry and quartz formation of low value. Some repairs have heen made in the main drift. Have continued repairs in the Con. Virginia shaft between the 1300 and 1400 level stations in order to place pipes therein to carry off the water flowing from the workings of the West Con. Virginia and California Company.

Have shipped to the Morgan mill during the week 325 tons and 1470 pounds of ore, the average assay value of which, per railroad car samples, was $60.59 per ton. The average assay value per hattery samples of all the ore worked at that mill during the week—135 tons—was $68.47 per ton.

The Union Con. and the Sierra Nevada joint north drift on 900 level is in hard porphyry. The west crosscut on 1465 level of Mexican is in porphyry, showing fine lines of quartz. The east crosscut on 1465 level of Ophir is in vein porphyry, with hunches and lines of quartz. The face in the old workings of the west crossent started from the end south drift from west crossent from northwest drift in the Central tunnel is in a quartz formation which assays from $2 to $10 per ton. The north drift from 420 level of Andes is in a quartz and porphyry formation. The workings on the 200 and 800 levels of Best & Belcher are in quartz and porphyry. The face of workings in Gould and Curry on 200 level are in soft porphyry.

In the Savage—On the 1000 level the north lateral drift started from the face of the east drift is advanced 20 feet. They are putting in square sets and stoping ore from the face of this drift. The south lateral drift started from the same point opposite the north drift is advanced 17 feet; face in quartz giving low assays.

On the 1050 level the west crosscut from the sixth floor of the south ore stopes was advanced 9 feet; total length 70 feet; face is in low-grade quartz. On the fourth and tenth floors of these ore stopes they have started east prospecting drifts, which are advanced respectively 6 and 10 feet. These drifts are in porphyry and quartz giviug low-grade assays.

On the 1100 level the north lateral drift for the station was advanced 20 feet; total length 263 feet; face is in quartz and porphyry.

Kennedy District.

New Era: On the Olympia claim, a mile north of town, owned by Riley, Burkim & Davidson, an incline is down 107 feet on ledge matter, assaying from $50 to $100 in gold and silver.

The Imperial mill is fast nearing completion. When the concentrators arrive, the mill will he nearly ready for operations, and capahle of reducing 1200 tons of ore each month.

The *New Era* predicts that iuside of two months 500 men will be working in the mills and mines of Kennedy.

OREGON.

Virtue District.

PUSHING THINGS.—*Democrat:* The Columhia mine is soon to hecome a healthy gold producer. The property has been hought by a Chicago capitalist and Toppy Johnson of California. He is the superintendent and has a force of men employed in the mine and building a boarding house, lodging house, office, etc. A site and building is also being prepared for a ten-ton Crawford mill.

BROUGHT IN $1500.—Baker City *Democrat:* Mr. Bartholomew, who, with Messrs. A. C. McClelland and H. Rust of this city is the owner of placer mines on Clark's creek, arrived in the city yesterday with a cleanup of about $1500. Mr. Bartholomew says the season in that section is about over, the water supply having failed.

THE BONANZA MINE.—The manager of the Bonanza Mining & Milling Company, near Baker City, is in Salt Lake conferring with the local directors of the company. He says they have a fine gold property and already it has produced about $50,000 worth of free-milling ore. They have a big ledge which has been developed by a shaft and drifts, but to operate the mine to advantage and to drain it of water and cut the vein on its dip at greater depth, a 750-foot tunnel is heing driven. Mr. Shelton reports a great deal of quartz and placer mining going on in his region with satisfactory results.

THE SALE OFF.—The Black Butte mine at Fox valley, Grant county, is a property that has come into prominence of late on account of the attention paid to it hy experts sent to examine it at the instance of Messrs. Daly and Haggan, who had a bond for its purchase for a consideration of $100,000. Messrs. Bulow and Allen have been waiting patiently to receive instructions to negotiate the deal, hut the word not coming and the hond having expired, the sale is declared off.

THE GOLD OUTPUT.—*Democrat:* The gold output of Baker county for 1894 promises to reach the figures or exceed that of any former year in the history of mining in this section. As the fall season approaches and the supply of water for placer purposes diminishes, cleanups are heing made and daily there arrives in the city at the hanks quantities of gold, either the result of the old-time rocker process or the modern improved hydraulic giant.

The Nelson mines in Pocahontas district, six miles west of Baker City, sent in an output of 165 ounces, of a fineness of $16 to the ounce—$2640—taken from a side race in the claims. Such an amount was quite a surprise to Mr. Nelson, since he did not expect to get more than $1000, only a small amount of ground in this part of the diggings having heen worked. If this result is any criterion to judge of the richness of the other ground washed this season, then there will he a large clean-up at the close of operations.

The Last Chance mine at Cable Cove, operated hy John C. Young with a three-ton Crawford mill, is in with nearly $200, the result of a three-days' run.

Walter Moore, of Sparta, brought in to the Baker City National Bank between $300 and $400, taken from a claim at Sparta with a rocker.

WASHINGTON.

THE MARCUS FLATS.—COLVILLE: W. B. Aris and C. E. Brooks have claimed a large section of the Marcus flats under the mining laws, and are preparing to put in some very extensive works in that line. The sands that are thrown over the flats hy the recent flood accumulated to the depth of from two to ten feet, and are said to he so rich in dust that gold can he panned out at the rate of from one

to five cents to the pan. A wheel will be placed in the river near the town of Marcus for the purpose of raising the water to a height of twenty feet. It will then be confined in flumes and conveyed over a distance of a mile to the sand bars.

THE OKANOGAN COUNTRY.—At Squaw creek a townsite has been laid out, three arrastras are in operation all crushing rich free-milling rock, and a ten-stamp quartz mill is in course of erection. Crosby Bros. have an order in for a five-stamp mill and Kingham also proposes to erect one a mile north of the townsite.

Three hundred sacks of rich sulphide ore from the Highland Light and Hidden Treasure claims are now on the bank of the Columbia and will go to the Everett smelter for reduction. There are 200 people there, and the mines look well. Work is being pushed on the majority of the claims, and each one seems to improve with development. It is expected that some of the older propositions will be sold before fall to companies able to develop them. The greatest depth yet gained is sixty feet, the longest tunnel 112 feet, the former on the Highland Light, the latter on the Hunter.

A tunnel is being driven on the Ransomet claim. They expect to cut the vein at a depth of seventy feet in less than one week.

The Ben Hur and the Mountain Lily claims are looking well. An average assay of the Ben Hur vein shows $86 gold and nine ounces silver.

Excitement has been caused by the discovery of good placer ground eight miles northwest on Gold creek.

AROUND NELSON. The Silver King on Toad mountain has sixty men working, and has let the contract for the hauling of fifty tons of machinery from Nelson to the mine, a part of which is now on the ground. The consulting engineer is expected out from England in September, to decide upon the nature of additional machinery needed. The mine will soon ship 400 tons of ore to Denver.

The Poorman, near Nelson, is running night and day, both at the mine and the mill.

The Nelson Hydraulic Company will turn water on their placer ground at Fry creek, eight miles from Nelson, this week.

On her trip down the Nelson brought out twenty-six tons of high grade concentrates from the No. 1 at Ainsworth. This shipment runs 350 ounces, and it is intended for the Tacoma smelter.

IDAHO.

PIERCE CITY PLACERS. The Pierce City placer district is reported turning out well. One company controls six miles of ground along French creek, which they are groundsluicing with gratifying results. They intend to put in hydraulic works. The claim adjoining theirs was worked in a primitive way in 1882, and frequently produced $800 to $800 a day. The finding of $8 and $10 nuggets is not an uncommon occurrence now.

MONTANA.

THE SPOTTED HORSE.—*Madisonian:* Lewistown reports say one of the richest strikes ever known in the Judith mountains was made a week ago in the old Spotted Horse mine. A large pocket was found of ore running $10,000 to $13,000 in gold per ton. So far the extent of the body is not known, but during the past week more than $150,000 in ore has been removed. But two men are at work taking out ore, and the average is $15,000 per day to each man. This ore is not worked at the mills, but shipped to the Omaha smelter. This find proves the Spotted Horse to be the richest gold mine ever discovered in this State, leaving the celebrated Cable and old Penobscot far in the background. While a number of rich pockets and "kidneys" have been found in the Spotted Horse, this discovery is the most extensive yet found.

HIDDEN SUNLIGHT.—*Mining Area:* Dr. Head and J. B. Lockwood have bonded the Hidden Sunlight, Charles H. and the Little Bell mines in Lump Gulch to Messrs. McFarlane & Brock for $40,000 two years bond and lease. Parties have commenced work and are fully equipped to develop property. These claims are in the midst of good producing mines in this district.

THE BROADWATER AND BENTON.—*Miner:* The machinery at the Broadwater has been put in place, and the building at tunnel No. 3 erected. The showing at tunnel No. 2 continues good. There is a large body of ore yet intact toward the face of the upper tunnel.

Fine ore is being taken out at the Benton. A small seam is reported to run 27,000 ounces of silver to the ton. Of course the amount of such ore as this is very limited. The second-grade ore now being taken out averages about 400 ounces to the ton, and there is considerable gold in it. It is expected to commence shipments again shortly.

SOUTH DAKOTA.

ON CASTLE CREEK.—Harney Peak *Mining News:* Hannan & Baker have made a discovery near the Lookout mine on Castle creek. The ledge which they have found is 100 feet wide and is traceable for a long distance. The rock is a heavy pyrite ore, of which there are chunks which are nearly solid iron. The surface ore has been pretty thoroughly tested by assays, and ranges between $5 and $10 a ton. That the vein contains an exceptionally rich streak has been proven by one assay, which went $11,000 in gold to the ton of rock. At water level this kind of ore will turn free milling.

UTAH.

AT MERCUR.—*Tribune:* Messrs. Cole and Andrew, who have a bond on the Fairchild group at Mercur, have resumed work on the mine with a double shift.

The Glencoe people have two shifts of miners doing development work on their property and a similar force on the Lion location.

The Red Cloud mine has developed an eight-foot body of gold ore, about 700 feet north of the Sunshine property, which is also showing up a bonanza. The property is being worked by the Red Cloud Mining Company under a bond, and so encouraged are they that negotiations are on for the erection of a mill to convert the output into gold bullion.

The prospects of a mill for the Sunshine group are said to be very favorable. The ore developments are of an assuring character, and the 25-foot ore body is reported to be more than holding its own. Jacobs and Schen of this city have control of this property.

WILL TRY SPRAYING TUBES.—W. A. Graves has gone to Mexico with a consignment of spraying tubes to be used by the Pan-American Mining Company in the treatment of their gold ore by the cyanide process. It is claimed that tests made on a small scale demonstrate that by using the tubes in connection with the cyanide process in the solution tanks, a largely increased percentage of the gold value in the ore is obtained. The company is treating 100 tons daily at present, but with the new idea in full operation it is expected that the capacity, by quickening the precipitation, will increase to 150 tons daily.

MERCUR.—*Mercury:* Parties have been figuring for some time on lensing the Mercur dump and putting it through a cyanide solution a second time. There is a certain amount of gold in the ore which the cyanide will not touch on the first treatment, but which can be extracted after the tailings have lain for a while, and it is estimated that the whole dump can be treated at a saving of a dollar or more a ton, out of which, if the tailings are handled automatically, a fair profit could probably be realized.

NEW MEXICO.

THE MOGOLLONS.—*Enterprise:* A carload of new machinery for the Confidence Company's new mill has been shipped to Whitewater.

A large body of Peacock ore has been struck in the lower workings of the Maud S. which is very rich, running $60 to $70 per ton in gold, besides giving high assays in silver.

A blast furnace is building to smelt the rich silver ores of the Silver Cell and Climax mines. There is on hand about a ton of wire silver which is fully 60 per cent pure silver, and about 40 tons of second-class ore that will run 200 ounces in silver per ton. The Silver Cell mine, which produces this rich ore, has had comparatively little development done upon it. A shaft 135 feet in depth has been sunk upon the vein, and, at a depth of 50 feet, 75 feet of drifts have been run. In addition to this an adit level has been started to tap the bottom of the 135-foot shaft. At 100 feet from the month of the level a shaft has been sunk 55 feet in depth. The level, when extended to tap the deep shaft, will be 200 feet in length. Through all the workings of the mine very rich native silver ores are found running from 5,000 to 20,000 ounces per ton. The Climax mine, which is an extension of the Silver Cell, and upon the same vein, produces the same character of high-grade ore. The Climax has a 75-foot shaft upon it, little other development having been done. With the small amount of development as described above, these mines have produced about $30,000 worth of silver, even at present low prices of the metal. The mines are situated about seven miles north of Silver City, and about two miles south of Pinos Altos. The new smelter is being erected close to the mine.

COLORADO.

Gilpin County.

NEW STYLE OF STAMP MILL.—Central City *Register-Call:* A new style of stamp mill is in course of erection at the Empire mill in Black Hawk. It differs from the modern Gilpin county mill in several respects in that the batteries and housings are to form one solid casting which will weigh 4100 pounds, and the speed when running will be 65 drops per minute, the batteries having single issue. The stamps will have a weight of 650 pounds each, and the stamps ten-inch drop. The plates on the inside for amalgamating purposes are so arranged as to be taken out and replaced without raising the stamps. The mill will also be arranged for automatic feeding, thereby lessening the expense of a feeder. Tables below each stamp battery for amalgamating use will be the same as have been in general use here for several years. One of the advantages of the mill is that it will crush double the amount of ore now crushed in the present mills, and at the same time will amalgamate the gold to a higher percentage. One of these mills of twenty-stamp capacity is now in successful operation at Cripple Creek by the Summit Gold Mining and Milling Company.

A great deal of placer mining is being carried on this summer in the gulches of the county, both by Chinamen and white men, and the miners all appear to be making money. At several points in the main gulch running through Central City pay gravel is being washed, and between Central and Nevadaville several men have laid a long striug of boxes and are saving the gold.

In Nevadaville the ground where mills have stood is being washed for the tailings it contains, and valuable shipments have been made by the miners at different times this summer. The placer miners who are following the rich streak of pay gravel discovered by A. Ragor, near the head of Nevada gulch, are washing out a gulch 20 feet wide and from 14 to 16 feet deep, and are being amply repaid for their labor in moving this large amount of ground. The placer mines of this county have been big producers, and though they have already yielded thousands of dollars in gold their supply is not nearly exhausted, and they will probably continue to pay for years to come.

ARIZONA.

A FORTY-STAMP MILL STARTING UP.—Tombstone *Epitaph:* The old Miuas Prietas mill, in Sonora, northeast of Torres station, of forty stamps, on which dust and rust has laid heavily for years, is being overhauled and put in order for running again. The mill ran for sixteen years on ore from the Miuas Prietas mine, till a fire gutted the timbering of the mine. It seems that a mining location in Mexico does not follow the "lead or lode or vein," but makes a bee-line for the center of the earth, outside of which they dare not go. The Prietas mine at the time of the fire had encroached in many places on its neighbor, the Creston, owned by another company. It had not been completely worked out, but when the expense of puttiug in new timbering for what was left of it was considered, it was deemed best to abandon the mine.

The development of the Creston meanwhile has gone on well and has given forth some rich rock, all averaging so well that the company owning the same have leased the old Prietas mill and will soon have it in running order.

THE BULLARD MINE.—*Courier:* J. H. White and W. C. Parsons, former owners of the Contention mine at Tombstone, have returned from a trip to the Harcuvar mountains, where they inspected the famous Bullard mine for which the owners recently refused an offer of $250,000 cash. The Bullard mine is an immense deposit of gold ore of apparent volcanic origin. Three arrastras are steadily running on the mine, the average yield of the ore being $10 per ton. The ore assays all the way from $8 to $60 per ton.

Coast Industrial Notes.

—The China-Japan war has stimulated San Francisco flour exports.

—A monster log raft, which will be shipped to San Francisco, is being constructed at Astoria, Or.

—The Northern Pacific coal mines at Roslyn, Wash., reopened yesterday, the strike being off.

—There is a revival of the flax industry in Oregon. Around Scio some 600 acres is in flax this year.

—Specifications and plans have been made for the electric light plant at Anaheim. The cost is estimated at $7000.

—The Viticultural Commission says 6,713,240 gallons of wine were exported from this State during the first six months of the current year.

—On the Pacific coast there are 132 salmon canneries, 38 of which are located in Alaska, 39 in British Columbia, 23 in Washington, 24 in Oregon and 8 in California.

—It is figured that the Columbia river salmon pack for the season that closes to-day will be 421,000 cases, of four dozen one-pound cans each, as against 385,500 for last year.

—The Oregon Sugar Company has incorporated to cultivate the sugar beet and to build and operate machinery for refiuing sugar. Capital stock $50,000. Principal place of business Portland, Or.

—The Reno Water, Land and Light Co. has bought 155,000 feet of lumber, to be used in the construction of new flumes on their Highland ditch, in pursnance of their policy of continuing the ditch into Prosser valley.

—The Chino sugar factory and refinery, the largest and most complete in the United States has started up. With this season's additions to the plant, made at a cost of $200,000, the factory will use 1000 tons of beets per day, and the daily output of refined sugar will be 140 tons.

—The United States battleship Oregon is expected to have her preliminary trial trip next week. She must develop at least fifteen knots an hour, but at the Union Iron Works it is thought her speed will be nearer seventeen, which would mean a handsome bonus to her enterprising builders.

—It is proposed to build an electric road from Merced to the Yosemite. The length as surveyed will be sixty-two miles, following the course of the Merced river. The power will be secured from a dam already built at Merced falls, and Merced will be furnished power for light and manufacturing.

—When the five new engines now being placed at stations B and C in this city to supply the recently laid underground electric wires are in operation, it is believed they will constitute as large and well equipped electric light stations as any in the United States. The capacity will be 72,000 incandescent lights of 16-candle power.

—Francis Smith & Co. of this city are making and placing twenty-two miles of pipe line for the Oakland Water Company, from Alvarado to Oakland. From the wells to Twenty-third avenue the pipe is thirty-inch; thence to Oak street the pipe is twenty-inch. It is expected to have the entire work finished by November 15th. To manufacture and successfully put in place twenty-two miles of such large iron pipe is a work of no ordinary magnitude, and is well done throughout, Messrs. Smith & Co. going ahead at the rate of 800 feet a day.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Philip Hayes in the Hayes & Stedman Mine near Gold Lake, Sierra Co., to deposit tailings on a flat in Mohawk Valley; from Stephen Soriceo in the Mohawk Mine near Johnsville, Plumas Co., to deposit tailings behind log and brush dam in a ravine; from Frank F. Vanzhl in the William Tell Mine near Johnsville, Plumas Co., to deposit tailings behind log and brush dam in Yankee Ravine; from Nicola Rossi and Peter Lorenzo in the Grizzly Bear and Garfield Flat Mines near Johnsville, Plumas Co., to deposit tailings behind dams in Squirrel Creek; from Keegan and Lowe in the Howard Mine near Onc, Shasta Co., to deposit tailings behind brush dams in a ravine; from C. H. Steel in the Steel & Co's Mine near Brownsville, Yuba Co., to deposit tailings behind stone dam on New York Flat; and from the Consolidated Amador Volcano Hydraulic Gold Mining and Land Co. of California in the Cliff Hill and Elephant claims, to deposit tailings in Sutter Creek; gives notice that a meeting will be held at Room 12, Flood building, San Francisco, Cal., on Monday, August 13th, 1894, at 1:30 P. M.

THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.
LIMITED.

TRADE MARK.

(MacARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING.

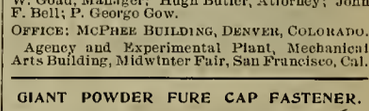
To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

Agency and Experimental Plant, Mechanical Arts Building, Midwinter Fair, San Francisco, Cal.

GIANT POWDER FURE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and immumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

MOODEY & SHERWOOD, Fresno, Cal.

Gold Quartz Mine For Sale.

A Good Quartz Mine, near Scott Bar, Siskiyou county, is offered for sale. Parties wishing to invest in quartz-mining property will do well to examine this ledge, from the extension of which ten-dollar rock is now being crushed. The average width of the ledge is two feet. For further information, call on or address W. A. CHAMBERLAIN, Yreka, California.

DEWEY & CO., 220 Market St., SAN FRANCISCO,
PATENT SOLICITORS.
ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered homo inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Electrical Progress.

Electric Motors.

The electric motor was invented eight years before the dynamo, and for several decades was considered of more importance, both scientifically and practically; the motors for Jacobi and Page, for example, being far more powerful than any contemporaneous dynamo. A search through the patent records of the United States and England would show also that more attention and greater expectations were then based upon the motor. This was undoubtedly due to the fact that inventors hoped to obtain a source of power which would rival or surpass the steam engine. It was gradually realized, however, that the cost of electrical energy obtained from a primary battery is so high that it cannot compete with a steam engine. The number of pounds of zinc consumed in the best battery, per horse-power hour, is about equal to the weight of coal required to give the same amount of energy in a steam engine, and since zinc costs about 50 times as much per pound as coal (in fact, it actually requires several pounds of coal to produce one pound of zinc), it is obvious that the primary battery is far more costly than steam in the generation of power. As a matter of fact, electrical energy from a primary battery at the present time costs at least 10 times and probably 20 times as much as that obtained by the use of a steam engine and dynamo.

The realization of this serious difficulty greatly discouraged scientific men and inventors in regard to the electric motor. A reaction set in against it, and for many years it was comparatively neglected by the best workers. The dynamo was taken up in its stead and developed in the remarkably rapid and successful manner which is the greatest practical achievement of recent times. The neglect of the electric motor continued until about 1887, the dynamo having by that time reached a state of great perfection and being in extensive use for electric lighting. The development of the dynamo, and the laying of electric light circuits through the streets of many cities and towns, provided the very supply of reasonably cheap current which was needed for the motor, and which the primary battery had failed to give.

This fact encouraged inventors and manufacturers to again take up the motor, and since that time its progress in this country has been very rapid; but even now the motor is somewhat overshadowed by the dynamo. The number of electric motors in use in foreign countries is not very considerable, but in the United States there are probably about 50,000 stationary motors and several thousand railway motors. The last fact probably explains why the literature of the dynamo is much more complete than that of the motor, since most of the books are written by Europeans—the time of Americans being occupied rather with making and *using* dynamos and motors than with telling others how to do these things. The most recent history of the motor includes the invention, by Tesla, in 1888, of the two-phase alternating-current motor and the development of the two and three-phase systems. These important systems are now being practically used, and an enormous electric power transmission plant is being installed at Niagara Falls, which is to be operated by the two-phase system. Indeed, it may be said that the progress of the electric motor at the present time is equally as rapid as, and more interesting than, that of the dynamo.

In considering the construction and action of the electric motor, the first and most important fact is its great similarity to the dynamo, or, more strictly speaking, it is practically the same machine used in exactly the opposite manner. The dynamo is a machine which generates electric current when driven by mechanical power. A motor is a machine that develops mechanical power when supplied with electric current; thus the functions of the two machines are exactly the converse of each other; nevertheless, identically the same machine can be used for either purpose, that is to say, the machine is perfectly reversible. It is also a fact that a machine that is good for one purpose is good for the other. The tendency now is for manufacturers to make exactly the same machine, and use it for either purpose indiscriminately, with only very slight differences in the details of winding connections, etc.

Non-magnetic Watches.

Within the last ten years a new class of troubles with pocket timepieces has been developed. Not only inferior watches, but also fine chronometers, have a way, often rather abruptly, of becoming quite irregular in their conduct. It is not simply that they begin to lose time in a remarkable manner, after running very correctly for months, or even years, but there are such variations in the losses that it is impossible to regulate them. One day the watch is only a minute behind, and maybe it is fifteen the next. When the owner takes such a timepiece to a watchmaker, the latter, on learning the symptoms, will probably open the case and set a tiny compass down over the hairspring. If the magnetic needle then becomes suddenly convulsed, twitching first in one direction and then in the other, the expert smiles and says: "Yes, I thought so. Well, sir, your watch is magnetized. Been riding on the trolley cars, I s'pose, or standing near a dynamo." The usual cure for such a disorder is to draw the watch through a coil of wire carrying an alternating current of electricity. Such treatment, however, does not preclude the possibility of another attack, although it may be a long time before the difficulty recurs.

What is still better than this is to make those parts of a watch liable to be affected by trolley currents, dynamos or motors out of non-magnetic material, instead of steel. Two or three foreign firms and at least one well-known American manufacturer now pursue that plan. For the hairspring palladium is employed, and for the escapement a composition known as "Paillard's metal." This is a foreign invention, and the exact nature of it is kept a secret. Of course, there are other methods of carrying out the general idea, and perhaps there is a hint of one it this solemn remark of the London *Watchmaker*, made after discussing the non-magnetic watches of America: "We are possessed of facts which we think it is as well in the interest of the English trade not to publish, but we are willing to supply them to our own manufacturers.

An apparatus for discovering internal flaws in iron and steel has, it is reported, been invented by Captain de Place, consisting of a small pneumatic tapper worked by the hand, with which the sample of steel or iron is tapped all over. With the tapper is connected a telephone with a microphone interposed in the circuit. One operator is required to apply the tapper, and the other to listen through the telephone to the sounds produced. Both are in electrical communication, and in separate apartments, so that the direct sounds of the taps may not interrupt the listener, whose duty it is to detect flaws. In applying the system, one operator places the telephone to his ear; and while the sounds produced by the taps are normal, he does nothing. As soon as a false sound, which is distinguishable from the normal sound, is heard, he signals for the spot to be marked, and by this means is able not only to detect a flaw, but to fix its locality.

GEO. E. BELMOR,
OF THE BELMOR BOILER WORKS,
Has Removed from 210 Mission St. to 52, 54 and 56 Bluxome St., bet. 4th and 5th Sts.
(To the old H. W. Rice Machine Works.)

Practical Information.

Ruins of Cochiti.

A mile from Allerton, N. M., are the ruins of an ancient pueblo, more than a thousand feet above the canyon, and accessible at only one place. Once on this summit, a wilderness of magnificence lies at one's feet. Twenty miles to the southeast can be traced the winding Rio Grande past the Indian pueblos of Cochiti, San Domingo, San Felipe and Santa Ana, where it is lost to view. East are the Santa Fe mountains, where, snugly ensconced, lies that ancient of all American cities, Santa Fe. Mountains and canyons greet the view in all other directions. From any data that can be gained in conversation with Indians or native people, this pueblo was in ruins in 1728. The pueblo is about 400 feet square, with a row of dwellings in the center, making two rectangular spaces entirely surrounded by the outer dwellings. Investigation shows that the outer dwellings contained at least three rooms of two stories.

In each rectangle is a large cistern lined with stones firmly mortared. The bottom of these, which is at least ten feet below the surface, is a sort of cement and very hard. This was demonstrated by digging. The tier of buildings forming the line through the center excited our curiosity, says a writer, and amply were we paid for our labor. In one room we dug at least four feet to what we reasonably supposed was the floor, on account of its hard, smooth bottom. In this we found tons of slag thoroughly impregnated with copper. Our conjectural theory was that this room was the smelter, if one can use the term. Charred wood, corn, corn cobs, seed, copper ore, and peculiar wheels, similar to emery, were carried away by us. These ruins deserve the attention of scientists and antiquarians. The houses are built of pomice stone laid in mortar and plastered on the inside. Five hundred feet above the town of Allerton, and overlooking the town, are the ruins of the ancient cliff dwellers. In fact, every summit in the immediate neighborhood shows these rooms; some are almost gone, having been washed away; others are of perfect preservation. The peculiar sign writings are everywhere visible. When were they occupied? Research may tell.

Return of the Wanderer.

Halley's comet is coming back—the comet which in the year 1066 shed a celestial splendor over the Norman conquest, and whose terror-inspiring visit was commemorated by the hand of Queen Matilda in the Bayeux tapestry; the comet that in 1456, the year of the battle of Belgrade, scared the Turk and Christian alike and was anathematized by a bull from the Pope; the comet whose strange scimitar form chilled the marrow of the ignorant and superstitious at its latest return in 1835. It is yet far away, says the Providence *Journal*, but the eye of science sees it, already within the orbit Neptune, rushing sunward and earthward with constantly increasing veloeity as it falls along the steep curve of its orbit. And a call to arms, a call for preparatiou, has just been issued from one of the chief watch towers of astrouomy. Professor Glasenapp announces that the computing bureau established by the Russian Astronomical Soeiety has undertaken the caleulatiou of the true path of Halley's comet, with a view to predicting the exaet date of the next return. He hopes that astronomers acquainted with unpublished observations of the comet will communieate the information to the society. After its perihelion the comet was watched retreating out into space until May, 1836, wheu it was finally swallowed from sight. It will be in perihelion again about 1911, but with the greatest telescopes now in existence and the greater ones that may then have beeu construeted, it is probable that the eomet will be deteeted eoming suuward a year or more earlier than that. The fact that the labor of computing the precise time of its returu is already about to begin gives assurance that the next time it will not be a question of how many days, but rather of how many hours or even minutes, the caleulations will be in error.

PETROLEUM SPIRIT, or benzine, is largely used in the silk and wool industries and in "chemieal cleaning" works as a solvent for greasy impurities. It is extremely volatile and inflammable, and has often been suspeeted of being the eause of those mysterious fires which occasionally break out in works and factories where it is much used. The ignition of this spirit has now been shown to be "spontaneous," and to be caused by electrical excitation. In eertain states of the atmosphere, especially wheu it is eold and dry, the spirit beeomes excited and exhibits sparks and flashes of light, to the aecompaniment of crackling sounds, and the ignition of the spirit may take place at auy moment. Kissling, in Germany, recommends that a small quantity of some kind of soap, soluble in petroleum, shall be dissolved in it, and maintaius that this will prevent the electrieal excitation, even when so little as 0.2 to 0.3 is added. The use of soap in spirit that is in a state of exeitatiou always averts the danger of ignition. This form of activity in petroleum spirit is never observed in moist or warm weather, the eonditions of whieh teud to carry off or prevent the manifestation of electrieity, and the soap probably provides the necessary moisture, water being otherwise non-miseible with petroleum spirit.

MAIWATCHIN, in Mongolia, close to the borders of Russian Siberia, is the one city iu the world peopled by meu only. The Chinese women are not ouly forbiddeu to leave their territory, but even to pass the great wall of Kalkan and enter into Mougolia. All the Chinese of this border city are exclusively traders, and they accumulate money till their trading with Europe through Siberia has ereated a suffieient fortnue to return to their uative eities and live in ease with their families.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 9, 1894.

Silver remains stationary, the expectation that the China-Japan war would advance the quotations being, so far, unrealized. The Ecuador Congress now gives notice that that country will demonetize silver and adopt a paper currency based on gold. The only noticeable new domestic feature is the increased coinage. The United States mints are all busy turning out standard silver dollars. There is 121,000,000 ounces of silver on hand, which cost about $125,000,000. This is covered by "Treasury or coin" notes, redeemable in gold, so long as the bullion exists as bullion. When coined and silver certificates issued these notes are no longer gold obligations, but silver ones. Thus, the present silver standard dollar coinage reduces the gold obligation and relieves the gold reserve, about which so much has recently been said and sung. Should $2,000,000 in silver he coined, it would still leave each gold dollar supporting about $7.75 in gold-hearing obligations. It will thus be seen that the day is still very far off when the Government can sell gold. During the nine years from June 30, 1867, to June 30, 1876, the Government sold $517,000,000 in gold.

During the first seven months of the year the San Francisco mint coined $13,219,156. Of this, $11,125,000 was in gold; the remainder in silver.

The Philadelphia mint, in '93, worked 320 tons of gold. At the same time there was melted and coined 3,050,000 ounces of silver. The working over of the gold is a remarkable record, and in no previous year have all the mints and assay offices in the country combined done so much work. The great amount of 9,310,254 ounces of gold handled during the past year in the Philadelphia mint is phenomenal.

The average for the last eight years is 957,371 ouuces. The entire amount of gold worked up hy the melters' and refiners' department of the Philadelphia mint would make a pile of 592¼ cuhic feet, with each cuhic foot weighing ahout 1070 pounds. This would make a mass ten feet square and five feet eleven inches high. In the handling of this immense amcunt of precious metal the chief of the melters' and refiners' department is allowed a legal wastage of one ounce to every 1000 ounces handled, hut nothing like the legal allowance is wasted. During the past year it was about ten per cent of that amount.

The Director of the Mint, under the law of 1890, has fixed the value in United States money of foreign silver coins as follows for the next ninety days: Mexican dollar, 49.7 cents; Peruvian sol, 45.7; Ecuadorian sucre, 45.7; Colombian peso, 45.7; Bolivian Boliviano, 45.7; Central American peso, 45.7; Japanese yen, 49.3; Chinese tael of Shanghai, 67.6; Chinese tael of Haikwan, 75.3; Russian ruhle, 36.6.

Copper continues quoted at former figures; about 15,000 tons are monthly produced, one-half of which is exported. Foreign copper mines are turning out about 6500 tons per month.

From Almaden, Spain, comes the statement that the farther the distance traversed in the mine the hetter the quality and the greater the quantity, which is not wholly satisfactory from a local point of view. The New Almaden mine produced 6614 flasks in '93, the Napa Con. 6120, and the New Mirahel 5211. The California product in '93 was 30,164 flasks of 76½ pounds each.

Free or "protected" coal is still a dehatable question. Canada imposes a tariff of 67 cents a ton on United States coal, hut would not object to have dominion coal admitted here free.

During last week 9124 tons coal arrived from coast mines; 18,375 foreign. The yards are full and demand is very light.

New York Prices.

Mining Share Market.

SAN FRANCISCO, August 9, 1894.

Ever since the Rule regime there is a quietude unsatisfactory to those who helieve in hrisk sales and quick returns. Demand is dull and plungers are not visihle. The rumors that Milt Ballard was going to open up a body of ore he knew of in Con. Va., that Superintendent Lyman had tendered his resignation, etc., have been turned under. The quotations of stock keep up, but the volume of business is light.

The test of Crown Point ore at the Mexican gave an average gold yield of $8.23 per ton. Figuring on a total cost of $5.25 for mining and milling, this is very satisfactory. It is thought that the test of Savage will show as well.

Following is the cash halance reported hy the several mining companies on hand on the 6th inst.:

Alpha	$6,700	Julia	$1,084
Alta	4,304	Justice	129
Andes	16,889	Kentuck	1,804

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 31, 1894.

523,954.—POTATO PLANTER—D. M. Baldwin, Los Angeles, Cal.

523,886.—CARTRIDGE HOLDER—M. H. Durst, Wheatland, Cal.

523,963.—WAVE MOTOR—E. Gerlach, Santa Monica, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished hy Dewey & Co. in the shortest time possible (hy mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possihle time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRUSS.—No. 522,764. July 10, 1894. Robert Magler, San Francisco. This invention relates to an adjustable, automatically acting pressure plate and pad for the support of abdominal hernia. It consists of an elastic plate having an arched concave opening at the lower edge whereby it is adapted to fit the parts to he treated, and in conjunction with this, of an elastic ring having one side fixed at the crown of the arch and the other crossing the lower part, together with a pad of soft material fitting the pressure plate, and adapted to press against the part to be treated. This device is provided with suitable pad and thigh straps by which it is secured in place and the pressure varied and regulated as may be desired. The straps are provided with loose tubular sheathing which allows them any desired movement without chafing the body. This truss can be worn as a protector against rupture and will recommend itself to the public on account of the virtues above enumerated.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 hy its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

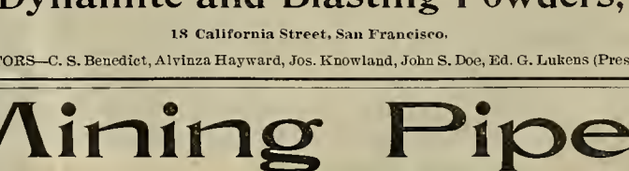
Mining Pipe!



STEEL OR IRON.—We make pipe of either, hut recommend STEEL, it heing superior to iron in many particulars and inferior in none.

COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.

COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

SCHAW, INGRAM, BATCHER & CO., Hardware Merchants,
SACRAMENTO, CAL.

In Southern California.

Not since the days of '49, says a San Bernardino dispatch, has there been such activity in mining circles as there is now in southern California, and the movement of wagon trains from here and other points nearer the gold fields revives the old days vividly in the minds of the old-timers.

Out upon the desert, a few miles north from Golf's, where but a few months ago was nothing but barren uninviting desert, is now the thriving camp of Vanderbilt, with its newspaper and railroad connection with the outer world by means of the Nevada Southern and Southern California railroads. Except the laying off of a few of the men because of the recent strike upon the railways having cut off the supplies necessary for continuing operations, every miner of ability who came to this district was afforded employment. A new voting precinct and school district were formed here and a special tax voted by the progressive miners to keep school going.

A big force of men is at work in the Bronze mine, and the mill was running night and day until the strike gave an opportunity to close long enough to clean up and make some needed improvements.

Another good property is the Boomerang, which is showing better ore as it is developed, and turns out some good bullion.

In the Queen of the Night, at a depth of 80 feet in the west shaft, three fine veins have been found. At the bottom of the shaft is a rich vein nine inches wide, and another like it upon the side, and a third 18 inches wide in the hanging wall.

Work has also been active in the Lost Horse, Boomerang and Queen of the Night mines.

A number of ch'oriders have been found in the district, but the demand for the miners in the mines has been so great that they have done little for themselves.

Near Indio, on the line between San Bernardino and Riverside counties, there is some activity, and a two-stamp mill is run by a gasoline engine, and when running at its full capacity works up about three tons of ore in twenty-four hours, the ore coming chiefly from the Pivon mountains.

A large number of mining locations have been filed about here, nothing east of the Lost Horse mine. Good float has been discovered west of there. The weather is so hot, though, that it is difficult to do anything at this season of the year.

MINING

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

NOTICE OF ASSESSMENT.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, Cal.; location of works, Virginia, Storey county, Nev.

Notice is hereby given that at a meeting of the board of directors, held on the 27th day of July, 1894, an assessment, No. 74, of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, room 69, Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of August, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 21st day of September, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the board of directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada block, 309 Montgomery street, San Francisco, Cal.

DEWEY & CO'S

Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Advice and Circulars free.

Union Gas Engine Co.

Pioneer Manufacturers

Of Gasoline Engines and Owners of Twenty Patents on Same.

ENGINES FOR MINING PURPOSES A SPECIALTY.

WARNING!

If you are in need of power for mining purposes investigate this engine and take no other. Many so-called gasoline engines are now on the market, which are direct infringements of our patents and it is our intention to bring suit against the various infringers. As the law holds the purchaser, as well as the manufacturer, we would advise parties who have already purchased other gasoline engines to obtain from the sellers of such engines a good and sufficient bond protecting themselves in case damages are obtained against them, as it is not the policy of this company to work a hardship on innocent parties, but the law makes no such provision.

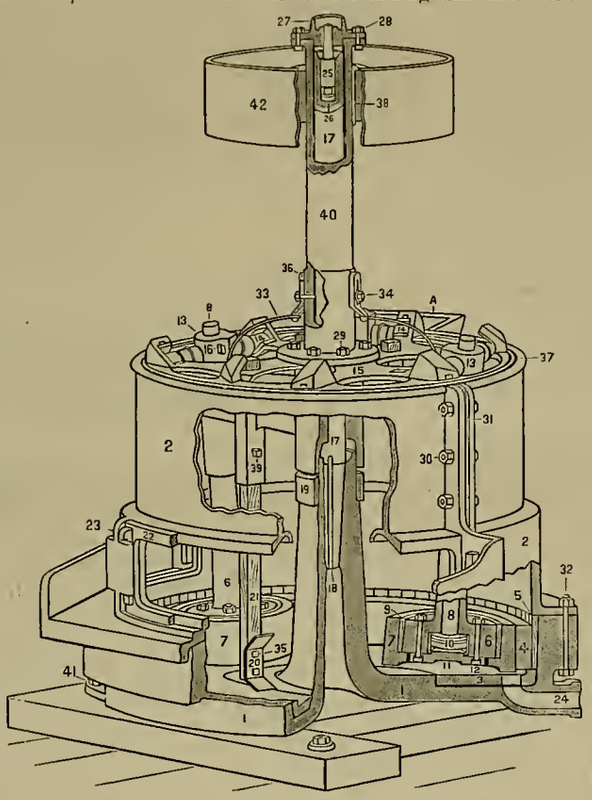
Improved Quartz Mill.

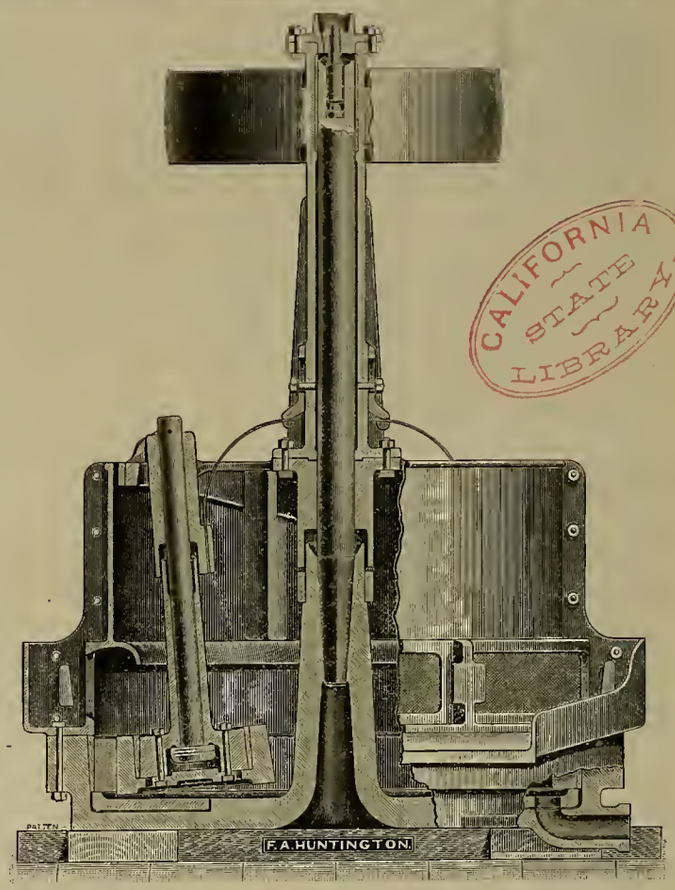
F. A. Huntington has made still further improvement in the centrifugal roller quartz mill. Herewith are given illustrations of the new mill, a general and sectional view being presented. The ore and water being fed into the mill at the hopper, the rotating rollers and scrapers throw the ore against the ring dye, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The inventor says: "This improved mill has the following advantages over my geared mills, viz.: 1. I dispense with the wooden frame with posts, and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts. 2. I dispense with gearing, and drive direct from a pulley. 3. There are five less places to oil. 4. The mill is built much heavier and stronger than the former ones. 5. Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity."

The mill is manufactured by the Fulton Engineering and Shipbuilding Works of this city.



SECTIONAL VIEW OF NEW QUARTZ MILL.



HUNTINGTON'S IMPROVED QUARTZ MILL.

Latest Electrical Devices.

The newest in the way of applied electrical energy is illustrated herewith. One cut represents the new type of the Electrical Engineering Company's motor for mining and mill work. The company has recently completed some large contracts where these machines are in use, notably the 125-horse power transmission plant installed at the Mammoth mine in Madera county. The machines are very compactly built with special reference to durability under hard usage.

The other illustration, while of only indirect interest to the mining world, shows the latest in the line of local electrical progress. It is a unique combination of motor and multipotential dynamo, manufactured by the Electrical Engineering Company of this city for the Postal Telegraph Company. By an arrangement of the brushes of the dynamo any desired voltages may be obtained for the different circuits. Three sets of the machines are in use in the telegraph company's office on Market street, where they have taken the place of the battery cells which were used for charging the telegraph lines.

The Stewart Mining Bill.

Senator Stewart's mining bill, which passed the Senate about sixty days ago, is no further on the road to become a law. It is to be hoped all efforts in that direction will be as unsuccessful as they have hitherto proved. That the law of May 10, 1872, is defective and unsatisfactory is confessed on all sides; but bad as it is, some of the amendments and changes so persistently urged by the Nevada Senator make matters still worse. There are some good provisions in the bill, but the mischievous clauses so detract from its value as a whole that it leaves the general matter in a worse condition than before.

It is unfortunate both for himself and the cause that he assumes to guide and guard that Senator Stewart is so self-important and apparently so conceited. He declines to accept any modification or change, and practically says "my bill or nothing."

He introduced his bill in '88, but it was unsuccessful. In December '89 he introduced the same bill; he got intelligent communications from California miners and others, criticising the bill in a friendly way and asking that certain alterations and emendations be made. These were almost totally disregarded at the time, but his bill was kept from passing, and in December '90 he brought a third bill into Congress which was an improvement on its predecessors, but not what was wished. The House Committee on Mines and Mining made a very good report on the bill, but the Nevada Senator assumed the role of Sir Oracle and would not have anything done or made or suggested unless it emanated from him. In '91 he introduced his bill again, and after running the gauntlet of the House mining committee, the Senator repeated it in February '92 with amendments. Again it failed, and again its indefatigable author has brought it up. The bill which passed the United States Senate on the 15th of last June is almost precisely the same that he reported in February '92.

The only differences are that where in the proposed amendment to section 2324, in the bill of February 2, 1892, he had a requirement that there should be ten dollars' worth of labor annually performed on each subdivision of a placer claim less than twenty acres, the ten is now changed to fifty; and in the proposed amendment to Sec. 2325, the words "or land that is chiefly valuable for building stone" are left out of the recent bill which passed the Senate.

We would not impugn the Senator's motives; he may be honest, sincere and actuated solely by a desire to render public service; but, ordinarily, stubbornness, tenacity and dogged disregard of courteous and intelligent remonstrance are not characteristics of statesmanship. The sole thing manifest appears to be his great opportunity as a United States Senator. His influence is unquestioned, and it is for this reason an additional regret that interference or counsel are disregarded.

California objects strongly to the Stewart bill, and it is the deliberate opinion of men who have given the subject mature consideration, who have had years of practical experience and observation, and whose station and standing entitle them to respect, that its passage would be an injury to the State's mineral interests and be fruitful only in litigation.

The bill cuts down the amount of placer ground which may be applied for in a patent to forty acres; making necessary an annual expenditure on each forty-acre tract, and additionally requires $50 worth of work annually on each twenty acres. In this regard the Stewart bill may be called "an act to hamper and destroy the drift mining industry of California."

Senator Stewart knows as well as any drift miner in California that that is an unjust provision in his proposed law which makes no distinction between surface and exposed placers, and that would compel a man to first spend $100,000 in tunneling to find a channel or paying lead before he could get a patent or be recognized by the department as having any legal rights. To successfully demonstrate the existence of such channel requires at times possessory ownership of 500 and even 1000 acres, but this would preclude the possession of more than forty under a single patent.

And the same way as to California's petroleum interests. Ordinarily a petroleum tract of only forty acres is not valuable enough to justify the expense necessary to develop it. Senator Stewart is acting in ignorance or defiance of these facts. Any one acquainted with California's industries knows this. Were the pending amendment to become a law it would be a direct blow to the State in several important regards. Perhaps Senator Stewart does not mean that it should, but a measure can only be judged by its manifest effect, and whatever the Nevada Senator's faults no one can justly consider him as wanting in intelligence or experience.

Last October was held in this city the State Miners' Convention. The Stewart bill received full and friendly discussion, and, after due deliberation, a committee composed of men, who, without any derogation to Senator Stewart, know as much about these matters as he does, recommended certain amendments to the statutes in question in connection with and partly amendatory of his proposed amendments. Their recommendations were adopted by the convention with but one vote in the negative. But the work of the convention was ignored by the Senator from Nevada.

"Everybody is wiser than anybody." Pride of opinion and personal self-sufficiency should give way and generally do give way in manly recognition of public rights and public duties, and it is with regret that Senator Stewart's course in this case is observed by many who knew and learned to trust him in the old days, and who even now refuse to believe the suggestions that sordid motives and unworthy personal influences work against his recognition of the broader, brighter aspects of the case. 'Tis always better to understand one another. Nearly all the ill will in this world arises from ignorance of each other's better qualities. In this case co-operation is better than antagonism, but the miners of California clearly see and strongly protest against the unwise and unfair propositions in Senator Stewart's bill, and every honorable means will be used to prevent its becoming a law.

A Decision Reached.

A case of considerable interest to the mining world was decided in the United States Circuit Court last Monday. It was the action between the Wyoming Con. Mining Co. and the Champion Mining Co., involving some points similar to the Amy case. The whole matter was set forth at length, with illustrations of the ground in question, in the MINING AND SCIENTIFIC PRESS of July 14th, '94, and the points of the case need not be repeated here.

The case was tried before Judge Hawley, who delivered the opinion, which was read by Judge Beatty of the U. S. Circuit Court. Both claims of plaintiff were sustained, the injunction granted as prayed for, and a decree made in accordance. The decision in substance is that the plaintiff has a prior title to the Wyoming and Ural mines, and is entitled to 1400 feet of the lode of the Ural trending downward between vertical lines, one extending through the Ural north end line, the other parallel to that line and intersecting the point where the Ural lode crosses its east side line.

The decision is to the further effect that the injunction granted carries with it an accounting. Considerable money is involved in the judgment, which has been awaited with considerable interest, not only at Nevada City, where the mines are located, but in other sections where similar conditions are believed to exist.

At the same time a decision, Judge Hawley's, was read in the case of A. Walrath, the owner of the Providence mine, against the Champion Mining Co., wherein plaintiff asked for an injunction restraining defendants from working south of a certain line, and for damages for ore removed south of such line. (This case was fully set forth and illustrated in this paper in the issue of June 30, 1894.) The decree was in effect adverse to the Providence Company by reason of the curvature of the ledge.

Both decisions are of more than ordinary interest, involving legal questions on property rights regarding mining patents granted under the act of 1866, which had not been heretofore decided. The full text will appear in next week's issue.

Should Be a Law.

The Caminetti bill which has passed the House should become a law. It puts the acquisition of mineral lands on an equality with agricultural lands. As it was in the beginning, is now, and ever has been, the miner had the worst of it, the presumption being all along that all land was agricultural unless the negative was clearly proved. Upon the miner rested all the burden of proof. Ordinarily, when land was taken up for agricultural purposes, the claimant produced witnesses who testified that the land was worth more for agriculture than for mining, and these witnesses usually knowing nothing about mining or mineral land could testify their belief without any show of unfairness. Should objection be raised, the objector had to directly prove that the tract in controversy was mineral land. In ninety-nine cases out of a hundred no one objected, and the patent was issued to the agriculturist. This has resulted in diminishing the actual mineral area for prospecting purposes, for once a United States patent is issued the miner has no more to say about that particular one-fourth section, no matter where it is. The tract may be plainly mineral land and good ground for prospecting, with valuable ore in sight. There is no redress. No one objects to the farmer getting every rod of government land in this State or any other, but the existing law's unfairness is manifest. There is more agricultural land than mineral land in any State of the Union. There are counties in this State where what is plainly mineral land is held by farmers under United States patent, proved up on as agricultural land. The bill which has passed the House, and which is in a fair way to become a law, corrects this existing injustice. It is not retroactive. It does not take away from the men who have acquired legal title thereto the thousands of acres that could to-day be mined for gold and silver were the facts in the case fairly stated at the beginning, but it will prevent future perversion of the public domain.

SOME time ago the South African gold-mine managers thought it would be a good idea to have a competitive exhibition of concentrating appliances, and a committee was appointed with power to act. In the course of investigation some of the committee arrived at the conclusion that concentration was not necessary at all, and from this premise naturally followed the deduction that the proposed competitive exhibition was unnecessary. The committee finally made a report in which it is guardedly stated that varying classes of pyritic ores have to be concentrated. The cyanide solvent seems to have cut some figure in the discussion, but it is probable the committee will finally conclude to relegate their theories to the business in hand and bold the proposed competitive exhibition.

The Battle Ship Oregon.

The preliminary trial of the new battle ship Oregon took place last Wednesday, the vessel leaving the Union Iron Works in command of Captain Minor Goodall. She was not pushed, the intent being simply to give the motive power a chance to revolve. She went under slow bell to Hunter's Point, Red Rock and back to her moorings. Everything worked satisfactorily.

This was in no way an "official" trial trip, the date of which cannot be announced. The Union Iron Works is ready, but the Government is not, and till the armor belt plates and turret plates are received her builders can only wait. It may be a year; it may be longer. At her official trial a speed of fifteen knots must be made, but her builders are confident a speed of seventeen knots can be registered. Of coure that would mean another handsome bonus to her enterprising builders. Recently the Minneapolis earned $400,000 premium for her builders by the speed displayed at her official trial, she being now the fastest war ship in the world.

Regarding this matter of premium on war ships, about which a good deal has been asserted by several unacquainted with the facts, it may be said that while the "premium" or "bonus" of $400,000 to the Cramps of Philadelphia, or of $300,000 to the Union Iron Works of this city, is a large sum, yet it by no means represents profit. It may also be said that the Government exhibits good business sense in offering such premium for every quarter knot excess of the required speed. A battle ship is valuable in exact proportion to her speed. Her ability to overhaul or get away from an enemy is of prime importance. When a great firm gets a contract for a great vessel, it puts increased cost in every bit of work to earn the premium, not alone for the money but the credit, the renown. Without such incentive the official minimum would be just reached. The Government gets all it pays for when it pays the bonus, for the vessel turned over is well worth it. No firm would like to take a big contract with a possibility of failure, but when it is seen that the expenditure of several thousands more than the specifications or estimates require may result in increased speed, the money is put on the vessel and the Government gets the good of it. That is to say, in the case of the Oregon, were the Union Iron Works required to make that vessel develop seventeen knots at her fortheoming trial they could not or would not have put in the bid they did for her construction at a required fifteen-knot speed. And it is probable that they or any other firm able to do the work would have had to make their bid higher than the amount of the possible Government bonus in order to meet the greater requirements. So that, after all, the "premium" is only part of the price the Government pays for a vessel that is proved to be worth it, and that "premium" by no means represents clear gain to the builders, for they have already spent a large share of it in making its receipt possible.

Personal.

PETER H. BURNETT, the first Governor of California, registered with other fellow citizens last Wednesday, to vote at the next general election. The old gentleman resides at 1713 Larkin street, this city, and is in his 86th year. He and Romualdo Pacheco are the only ex-Governors living who were elected under the old Constitution. Senator Perkins and General Stoneman are the living ex-Governors elected since the present Constitution went into effect.

COL. D. H. JACKSON is back from a lengthened sojourn on the Atlantic slope. It is his intention to develop the Chinaman mines at White Pine, Nev. He says that, although there is abundance of money in the East, it is a matter of present difficulty to enlist the attention of capital in any mining project, however worthy. As elsewhere, the business world needs a strong dose of faith cure more than anything else. Many there now think that the continued bear movement on silver injures the general course of business, and have considerably modified their views on this matter since the beginning of the present stringency.

Clipped and Condensed.

THE King of Siam is dead.

THE Japanese continue victorious in the China-Japan war.

THE Senate tariff bill has passed the House and awaits the President's signature.

CASERIO, the anarchist assassin of President Carnot, was guillotined at Lyons, France, last Thursday.

A PROTOCOL has been signed uniting Guatemala, Nicaragua, San Salvador and Honduras into one republic. Costa Rica was also represented at the conference, but that Government has declined to sign the protocol.

Concentrates.

THE Merrifield mine at Nevada City is being reopened.

THE Silver Grey mine, in Trinity Co., is to be started up again.

THE mines of Aspen, Col., are shipping 6000 to 8000 tons of ore per month.

THE Denver assayer expects to take in $1,000,000 in gold during this month.

THE Royal gold mine in Granite Co., Montana, will resume operations and dividends September 1st.

THE Resources mine of Sweetland, Nevada county, is to be developed, machinery now being on the way.

THE Defiance Mining Company is incorporated at Austin, Nevada, to exist for fifty years; capital stock, $1,000,000.

UNDER the superintendency of George Mainhart, the Ione, Galena and Bullion mines in Grass Valley district are to be worked.

THE case of W. W. Rodehaver, charged with embezzling the funds of the Placer County Miners' Association, was dismissed at the preliminary examination.

BODIE mining companies had cash on hand on the 1st, as follows: Bodie, $81,661.04; Standard, $33,315.35; Mono, $2063.98; Syndicate, $914.86; Bulwer, $4647.14.

C. D. LANE has a $25,000 bond for three years on the Giant King mine, two miles from Washington, Cal. Considerable work will be done and a mill erected.

THE Cumas No. 2 gold mine, near Hailey, Idaho, has been pumped out and a sufficient force of miners employed to keep the twenty-stamp mill running right along.

ON the Metlakatlah Indian reservation, on the Northwest coast, where gold was recently discovered, the Indians and the miners ask for protection from each other.

NOT to be outdone in gold discoveries, Chicago now announces gold quartz "visibly rich" in the big drainage canal now being dug from that pleasant prairie city.

THE Kennedy *New Era* says that that town is the only one on the coast that is not supplied with a drugstore (bleached) blonde, and the people are correspondingly elated.

THE Sebastopol mining property is now being worked by the Sunrise Gold Quartz Mining Company, with W. E. Lawton as superintendent. A hoisting works is being erected.

THE Denver mine at Forbestown, Cal., has shut down. About forty men are temporarily out of work. The bond on the property has expired and the leasers did not want to buy.

AT Frisco, Utah, it is thought that the work of rebuilding the Horn Silver hoisting works and concentrating mill, which were destroyed by fire last spring, will be completed about the 20th inst.

THE Gold Bank Tunnel Company at Forbestown, Cal., has just commenced to drive a 1200-foot tunnel in from the Feather River side. The company expects to erect eighty stamps more in the near future.

THE *Lode* of De Lamar, Lincoln county, Nevada, says that a deed was recorded during the week for an undivided one-half interest in two valuable mining properties from a gentleman to a lady, the consideration being "love, affection and $100."

ALL the hydraulic ventures about Kamloops, B. C., have been hinging on the developments of the Horsefly and Cariboo hydraulic mines. Word is received that the Horsefly cleaned up $4880 in 106 hours' work, and the Cariboo $5100 in 47 hours' work.

SOME Chinese gravel miners on Greenhorn creek in the neighborhood of Hunt's Hill, Nevada county, take out about $5000 every three months. The *Transcript* says they wash the gravel three times, thus obtaining about all the gold there is in it.

THE receipts of gold bullion at the United States assay office at Helena during the past week amounted to $120,088.74. This is the largest week's business in the history of the office, not only in amount, but in number of bars melted and assayed, 130 being handled.

THE Denver *Record* wants the General Government to offer $250,000 reward to the inventor of a cheap, successful process that will enable owners of very low-grade ores to handle and treat them at a profit. It might do, and often does do, a great deal less practicable work.

THE two San Francisco lawyers, who are suing the Comstock Tunnel Company for $9000 attorneys' fees have attached all or nearly all of the real and personal property in Lyon and Storey counties. The attachment covers about $75,000 worth of property, which includes ranches at Sutro and money in possession of debtor mining companies.

THE Mercur Mining & Milling Company of Mercur, Utah, has decided on the erection of a new mill, using the cyanide process, of 200 tons daily capacity. It will be double the capacity of the old mill and located close to it. New and improved machinery will be a feature of the new gold mill. The management decided to furnish all materials and let contracts for the labor.

THE Butte, Montana, *Inter-Mountain* recalls the fact that the Anaconda mine was sold to Daly & Haggin in June, 1881, for $30,000 by the Hickey Bros., and was considered a doubtful proposition then. In September of 1881 the St. Lawrence, an adjoining property, was sold for $162,500. These two properties, which a little over ten years ago sold for less than $200,000, are now considered second only in amount of ore produced and value of any in the world.

THE manager of the DeLamar mine, Idaho, gives the Boise *Statesman* the following, showing the output for July:

Ore crushed, 3715 tons 66 pounds.	
Amount realized	$70,484 32
Ore shipped	5,500 00
Revenue from other sources	2,110 32
Total	$78,094 64
Expenses	34,499 85
Estimated profits	$43,594 79

A Moseo, COL., dispatch says: The excitement over the recent gold find has been intensified by the discovery of rich float ore extending over a very wide territory, and many who have visited the field are making arrangements to remain permanently at the new field. A new town has been started and called Blanca. Buildings are in process of erection, and a stake line is running to the field. An assay of ore, selected with a view to avoid rich pockety formations, averages $700 to the ton in free gold.

THE Nevada *Transcript* says: Superintendent Blundell has a crew of ten men working at the old Murchie mine and is preparing to resume active operations before long. An upraise from the drain tunnel in the Alice Bell location is being made, and the company will shortly erect new hoisting works. The old Murchie mill, on Deer creek, which has been idle for ten years or more, is being repaired and put in running order. It is proposed to work the mine thoroughly and economically.

A. H. WARD has sold to the Sierra Butte Mining Company in Mariposa county the Whitlock, North Whitlock and Westward mining claims, the Whitlock, Spencer and North Whitlock mill sites, and the water location of A. H. Ward on the Merced river. About 240 acres of land were conveyed in the transfer. The Spencer, Alabama and a number of other mines contiguous to the Whitlock have been bonded by the same company, and they will probably be purchased before the expiration of the bonds.

THE production of copper throughout the world in 1893 has been given at 17,250 tons for Germany, 160 for Argentine Republic, 1425 for Austria-Hungary, 7560 for Australia, 2500 for Bolivia, 4000 for Canada, 6090 for Cape Colony, 54,270 for Spain and Portugal, 147,210 for United States, 21,350 for Chili, 400 for England, 2040 for Newfoundland, 2500 for Italy, 18,000 for Japan, 8480 for Mexico, 460 for Peru, 5000 for Russia, 750 for Sweden and 2850 for Venezuela. This makes a total of 303,975 tons, against 310,845 in 1892, 279,491 in 1891, and 269,630 in 1890.

DIRECTOR WOLCOTT of the Geological Survey has submitted his plan of operation for the present fiscal year to the Secretary of the Interior, who has approved it. Special attention is to be given to the survey of the mineral-bearing areas of Colorado, Idaho and California. The topographic work will be carried forward in twenty States, a large share of attention being devoted to the arid region of the interior and to the Pacific coast. Thirty-two topographic parties and twenty-seven geologic parties will be in the field, five of them being employed in the Rocky mountains and their foothills.

IN British Columbia a prospector is required to take out a license, which costs him $5, and he pays $2.50 for recording his claim. He is allowed to make two locations in a district. Claims are located 1500 feet square and no discovery is necessary before a location is made. A discovery must be made, however, within fifteen days after the date of the location. One hundred dollars must be expended on each claim every year. When $500 worth of work has been done on a claim, a crown grant, equivalent to our patent, can be secured for about $100. After that the Government requires the payment of $20 a year on each claim.

FOUR new mining companies filed articles of incorporation in this city last Wednesday, as follows: Western Investment Company, for mining purposes; capital stock, $100,000. Directors—Theodore Savage, George E. Stoker, J. F. Bourke, E. C. Marliave and D. E. Besseker.——Shamrock Mining Company; capital stock, $250,000. Directors—M. S. Reid, S. W. Backus, D. McPhee, M. J. Farrell and N. T. Bell.——De Soto Gold Mining Company; capital stock, $300,000. Directors—Irwin C. Stump, E. H. Clark, W. R. Hearst, Joseph Clark, F. G. Dunn, Arthur H. Wallace and Thomas Turner.——Crescent Mining Company; capital stock, $1,000,000. Directors—W. C. Stadtfeldt, A. K. Durbrow, H. B. Havens, Jacob Stadtfeldt Jr. and A. W. Havens.

THE California Debris Commission was at Volcano, Amador county, last week, to inquire why Sutter creek at Ione held in suspension so much debris. The miners in the neighborhood were notified to cease operations and await the report of the commission. It is thought restraining dams and settling reservoirs will have to be built. As hydraulicking in that section is on so small a scale this will hardly pay, and the waste water which originally comes to Volcano and into Sutter creek for mining purposes will not be taken up, with the result that the volume of water running down Sutter creek will be reduced. At last Wednesday's meeting in this city a permit was granted to the Hustler mine at Cherokee, Butte county, to wash one-half acre of ground. Several applications from Plumas county are still pending.

ANDREW HIGHTON has been arrested in Boston charged with passing worthless checks. He tells conflicting stories, among them that he belongs in Portland, Or., Denver, Col., and Baker City, Or. He says he is one-fifth owner of the Ornament and Surprise mine on Greenhorn mountain, Grant county, Or., and is in Boston to secure capital with which to work the mine. He called at the National City Bank and offered for deposit a draft for $15,000 drawn on N. Clarnel of Seattle, who, he says, is a half owner in the mine. When he presented the draft he told the cashier that he did not want it collected until the last of the month. The bank promised to accommodate him in this respect, but informed him that he would not be given any money until the bank had sent the draft West for collection. Highton went to Portland last April. He bonded the Ornament and Surprise mine in Grant county, and went to Colorado by way of this city to secure a twenty-stamp mill to put in the mine.

THE interest taken in South African and other mines is not confined to the British Isles. The London *Mining Journal* says the monthly returns are watched in Berlin and Paris with keenness, and the probable rise and fall of prices is considered as mathematically as it is in London. The operators abroad may not, however, be quite as cognizant of certain facts about African mines, and those of India to a lesser extent—that they are controlled by cliques and syndicates, and that the only chance the public has of operating is, not upon the merits of the mines, but by buying fairly promising shares which seem to be unduly depressed and selling them at the time when the cliques and syndicates are busy at what they call "making a market." In fact it comes to this, that, as on the turf, you bet primarily upon the character of the jockey and secondarily upon the merits of the horse; in dealing with Randt shares you put your money on the cliques and syndicates, and only in a minor degree on the merits of the mines. Of course, the syndicates like something to go upon. A good return, a timely discovery, a glowing report will probably be the basis of their operations, but the real merits of the mine are the last in their thoughts, and the market price of the shares the first,

A Colorado Gold Mine.

NO. II.

The incline shaft is driven down on the natural dip of the vein and in the vein, whose inclination is sixty-eight degrees from the horizontal.

The incline system of shafting on a vein is the best system in medium-size dipping veins, when the incline shaft is wholly in the vein and occupies its whole width, together with, if need be, part of the wall work as well. But in a very wide vein, particularly if it is all pretty rich, the vertical shaft is preferable, especially, too, when a great amount of haulage quickly to the surface is required.

If need be, the shaft may be located wholly outside the vein in the country rock, both in inclined small veins and vertical large veins, running close to and parallel with the vein, and reaching the vein by short cuts. This is more especially advisable when the vein in question is very valuable throughout its entire thickness.

In the Bassick is an example of a wide vertical shaft at Silver Cliff, Col. The shaft having been put down vertically in the center of this very valuable vein, when all the valuable material was worked away around it, there was little left to support the shaft but its own woodwork. It would in this case have been better to have put down a vertical shaft wholly outside of the vein, and have reached and won the ore deposit by short crosscuts from it. If an incline is put down on a wide, sloping vein, it should lie directly on the footwall, as in the present instance. On the other hand, the disadvantages of a vertical shaft cutting a dipping vein is that when great depth is attained such long and expensive crosscuts have to be made through dead work to reach the vein.

This was the case in the present instance. The

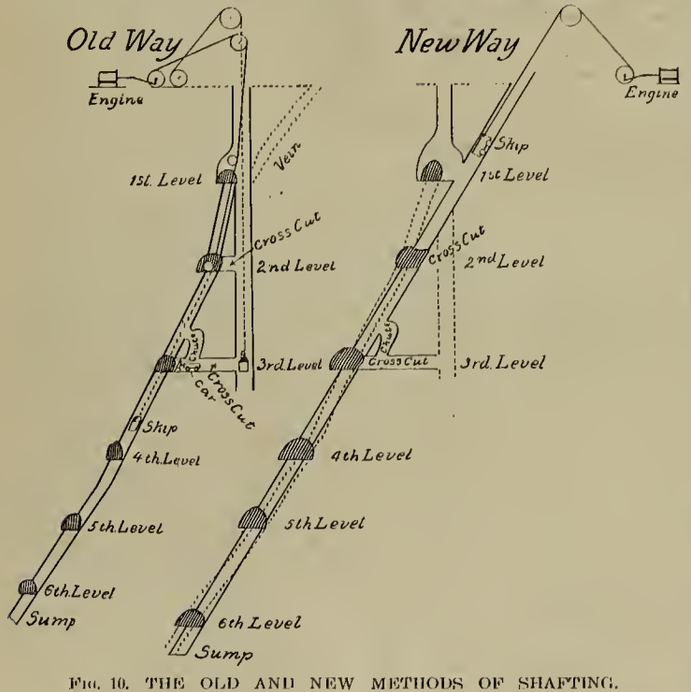

FIG. 10. THE OLD AND NEW METHODS OF SHAFTING.

original owners were old Comstock miners. This mine was developed by the vertical shaft and crosscut system, and so they applied the same system to this vein, but at 500 or 600 feet depth the expense of 100-foot crosscuts was very great. So a compromise was attempted between an incline and a vertical shaft, as shown in Fig. 10. This involved some two or three times handling of the ore, and by this system a loaded skip took about half an hour coming up to the surface from the bottom level.

The present manager concluded to abandon the old shaft and reopen the mine by the present incline, following the dip of the vein. Now the loaded skip comes up to the surface in less than a minute.

The friction on the machinery wheels, etc., of an incline are of course greater than on a vertical shaft, but expense, time and labor are saved, and ore is being taken out all the time instead of a perpetual system of dead work.

At the bottom of this incline shaft is the sump—a tank for mine water twenty-five feet square. A continuous stream of rusty, mineralized water pours down the side of the incline, receiving contributions from the outlets of the different levels, whose floors incline gently at a grade of ten inches in 100 feet toward the shaft on either side. The water drains from them by a gutter on the side of the rail track. This fissure vein, as in many cases, is the natural course of a spring. The water that pours down it is not mere seepage surface water, but a living spring in the vein itself.

At the foot of the incline, close to the sump, is a large pump for pumping up water from the sump through a bronze pipe, composed of brass, tin and alumina. This pipe is about five inches in diameter and cost $4 per foot, and with putting it down $5000. This expensive pipe was found necessary, as iron pipes were so rapidly eaten up by sulphuric acid, sulphate of copper, vitriol and other metallic acids of the ore.

In the sixth or bottom level, along the footwall, modern deposits of green sulphate of copper and red oxide of iron and other metalliferous minerals, combined with solutions of lime and silica, were seen, laying the foundations of a future and modern vein.

In these damp levels the destruction of iron work is extraordinarily rapid, and the expense of replacing iron pipes carrying air to the drills, etc., is great. These pipes have to be propped up above the wet ground. An iron shovel left only a day in these acid waters is ruined.

Such mine water, it is obvious, could not be used to feed boilers for steam purposes.

In the third level, at a point directly under the bed of the river, there is a good deal of moisture as well as a large ore body, and the deposition of iron oxide and copper sulphate in belts and streaks was very marked.

In this third level the dike of porphyry we have alluded to makes a sudden bend and, leaving the hanging wall, cuts directly across the vein, slightly faulting it. The vein matter does not pass through it.

In part of the third level, towards the south, which is neither dry nor wet but dampish, are great quantities of fungus adhering to the old stulls or woodwork, which have a rotting tendency like dry rot. It hangs down in festoons like white rags, or even coats the side of the mine with a white crust; it burns when a candle is applied to it, with a disagreeable smell.

This fungus is a fertile source of decay in old workings that are somewhat dry; on the other hand, timbers in the wet drifts saturated with mineral water are almost imperishable. These timbers are so water-logged and saturated with metalliferous solutions that they may be considered in a sense fossilized. An axe will hardly touch them, and doubtless if they were burnt something like a cast or replacement of the original fibers of the log would be found preserved in a metallic state.

In the third level was an instructive example of faulty timbering and of the importance of putting in timbers *just right* from the start. The stulls here, as in the other levels, are exposed to enormous lateral pressure from the hanging wall and are cracked, split and crushed; but, unlike the newer timbering, we observed these stulls to be frequently out of place, bent inwards, and in consequence that they had been propped up in all sorts of ways by the recent management to keep the level open. This was partly owing to the decay and age of the old stulls, but mainly owing to their not having been properly laid. The slope they preserved, to begin with, was too flat, and the butt ends, instead of being fitted into hitches, lay against the bare walls or rested on upright props, and their line of juncture with these props was so fixed that they would easily slide when

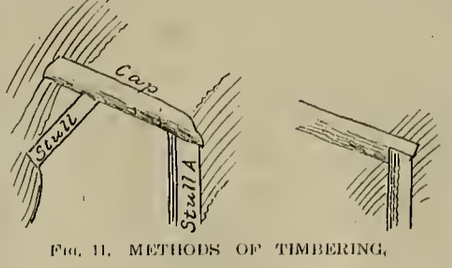

FIG. 11. METHODS OF TIMBERING.

the pressure was applied (see Fig. 11). Large pockets of ore had been opened up in big caves toward the end of this level.

To the north this level passes under the bed of the creek, yet strange to say but little water seems to seep down from this source. In excavations in the bed of the creek, they found that an impervious layer of clay lined the bottom. A large chute or body of ore occurs, however, beneath the creek; further on the level passes beneath the crest of the mountain and another ravine on the surface.

Near the end of the level is a rope ladder about seventy feet long leading into a stope, where, on the contact vein, the usual line occupied by the mineralized breccia gangue was filled by a solid mass of barren porphyry, beneath which, between the porphyry and the granitic footwall, lay the usual layer of rich smelting ore, composed of solid pyrites and bornite or purple copper, constituting a true "contact" vein between porphyry and granite. The ore below water level, that is, below the level of the creek, loses all its decomposed oxidized character and becomes solid unoxidized ore.

The ore-sorting room, 50x25 feet, occupies the upper story of a tall building; in the lower part are the bins and ore chutes, into which the sorted ore and refuse are thrown. The former is either wheeled to the mill for crushing, stamping and concentrating, or passes directly through chutes into the railway car, to be shipped to Denver for smelting. The mouth, or top, of the incline shaft comes directly up into this ore-sorting room, at the back end, and dumps its cargo of ore through a screen called a "grizzly" on to the plates and bench of the ore sorters, and its useless rock into a bin connected with the outside, where it is trammed off in a car to the dump.

The sorting room is lofty, and an open little house or skylight on the roof receives the wheel and top of the incline shaft. The position of the shaft scaffolding is seen in our sketch (Fig. 12) rising above a plat-

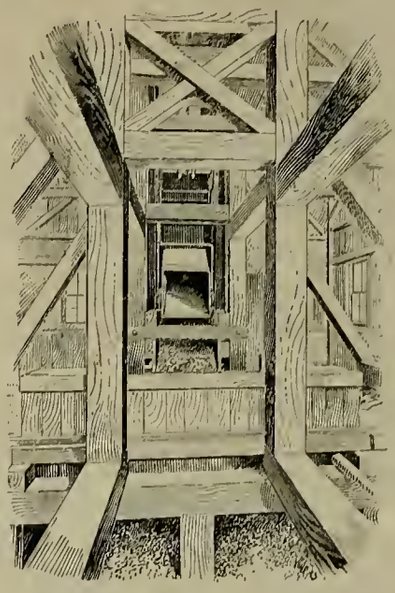

FIG. 12.—DUMPING ORE INTO THE SORTING ROOM.

form, standing about ten feet above the ore-sorting floor beneath. Material for the mine below is drawn up by the rope to the point A where the skip runs out on a horizontal rail, and automatically dumps its load (Fig. 13) on to the deflector B. This deflector

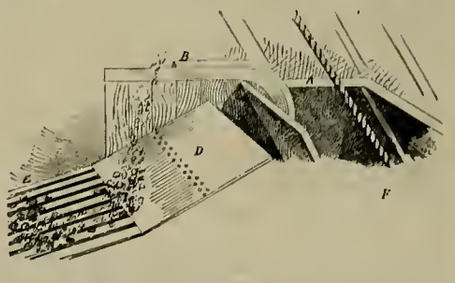

FIG. 13.—DUMPING ARRANGEMENT ON PLATFORM HEAD OF SORTING ROOM.

or apron is a plate of iron, swinging in a sloping direction on a pivot so that it can be reversed as needed. Thus, when the skip brings up a load of ore it falls on the apron and passes over the screen or grizzly D, its larger pieces falling on to the sorters' table E on the floor of the room, and its finer stuff passing through the grizzly into a bin or chute below for immediate transfer to the mill. If, again, the skip brings up only dead rock, the apron is reversed and the rocks are discharged down the open space F to be carted to the dump, so no time is lost.

As the mass or blocks of ore-bearing rock pile up on their table, the ore sorters, two or three men, select pieces and break them up with hammers, distinguishing by long practice the different values.

The material divides itself into three or four grades.

1st. Useless rock barren of ore.
2d. Concentrating or middle-class ore.
3d. First-class rich smelting ore.

The concentrating material is shoveled without much sorting into a mill hole, one of three in the floor, in a somewhat wholesale manner, as this class of ore preponderates, but from it is selected the first-class ore. This is put carefully into wheelbarrows, wheeled to a scale at the farther end of the

room, weighed up to 400 pounds and dumped down a separate chute.

Often pieces of ore will contain half poor scattery concentrating ore and rich smelting ore in the same piece. The sorter with his hammer breaks off the good from the medium, and throws the latter into the mill hole for concentrating matter

Besides this, is an intermediate class of large blocks, containing dead rock and some ore, which are piled up in heaps on either side of the room and are called "cobbing" ore, which the sorter cobs with

FIG. 14.—ON THE FLOOR OF THE SORTING ROOM.

his hammer at his leisure, extracting the good ore and throwing the barren rock down the rock chute. The sorters have each a box beside them, in which to put very valuable ore prior to its being wheeled away. An ore sorter requires to be one who by long habit has become acquainted with the surface look of ores of the mine, and can tell at a glance, pretty nearly, whether it is to be classed as first or second-class ore.

In some mines, as in the present one, where the distinction of the ores is very marked, ore sorting is not difficult, but in others, where the values are very much obscured, it takes an old hand to discern between good, bad and indifferent, and even the oldest hand is liable at times to throw aside a valuable piece of ore. However, the latter, unless thrown among dead rock, is not wholly lost if it finds its way among the lower grade concentrating ore, because it only goes to further enrich the concentrates above their average.

Through the mill holes the ores drop into the chute bins, and pile up there, until the railway car comes along, at the bottom of the building. And then a series of iron doors called ore chutes are opened by

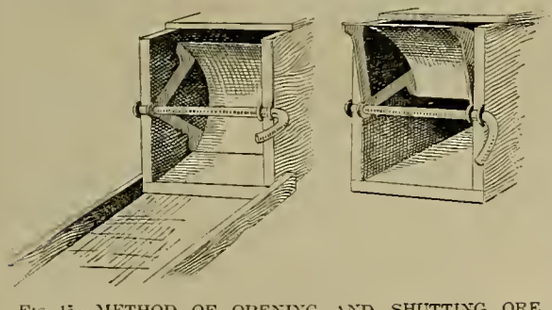

FIG. 15.—METHOD OF OPENING AND SHUTTING ORE CHUTE.

a bar and the ore pours into the box car ready to receive it. Fig. 15 shows the method of opening and shutting the ore chutes.

Mines in Good Shape.

Several Salt Lake men well posted on the silver and lead mining situation in Utah tell the *Tribune* that at no time have the old producers, as well as the new ones, been in a better shape for yielding up their treasures than at the present. For the last year or more the work has not been profitable, owing to the depression, but the showing made in nearly all the various mines are such that with higher quotations on silver and lead the output of the Utah mines would at once be double or treble the old-time figures. The opinion is quiet general that silver and lead will yet bring the good old prices before the depression came on and tariff tinkering commenced. There are many who believe that these metals will soon be restored to former prices, and with this conviction fixed in their minds are pegging away at silver and lead mining propositions in a stouthearted manner, with a sublime faith in the future.

The Coming Golden Era.

TO THE EDITOR:—When we consider that gold is the standard of all values, and as such is the life-blood of mechanical energy, commercial activity, and the great patron of art, we see at once the most important part this metal plays in the affairs of life. And here I will say, that while I speak thus of gold, under a proper financial decree silver would play its part equally with gold in its power for good in advancing the comforts of mankind.

History shows conclusively that when and wherever the precious metals were lavishly produced and distributed, the world's affairs dashed ahead at a corresponding ratio. It shows, too, that we must mine for the precious metals to maintain our wealth and civilization, or change our standard of value. What the past has done in the production of precious metals history in part records. What is in the future in this respect, and what it can be made to be, as excelling all past records, simply depends on the will of the masses to mine.

The acreage of the United States, British Columbia, Mexico, Central and South America, Russia, and the Australian isles and South Africa is of such extent that the mining world need not be idle for want of fields to engage in, for a thousand years to come, and that there is opening a spirit for mining for the precious metals, the worldover, is apparent to every one familiar with the business.

The cause is clear. The introduction of machine drills, whereby two or three men can perform the duty of ten times their number, the use of such effective explosives as dynamite, etc., etc., taken in connection, render the cost of displacement of ore hardly ten cents on the dollar to its former expense. The perfectness of mill machinery and the application of electricity to distant water powers, and to all departments of mining, becomes another great factor in lessening the expense of reduction.

Then comes the fact that science and practice in the manipulation of ores and metals have become so complete that the yield of per cent is, on the average, nearly double that of twenty-five years ago. Thus, the causes of failure in the past are apparent, and the successes of the future are assured; and hence I am led to say that the golden age of the world is not in the past but in the future, and what it may be made to be simply rests on the will of capital. The past was the product of muscle more than money. The future is more a matter of money than of muscle.

Having spent the greater part of my business life in mining, I presume to make the prediction, as through the telescope of these extended years, I see the golden aurora of the future.

To give weight to this idea of the coming golden era, we have only to figure back a single decade.

According to the best authority, Director Preston of the United States mint for one, the world's yearly gain of the precious metals has been as follows, and we will only take the past six years for figuring out the future, which will be found as follows:

	Gold.	Silver.	Total.
1888	$110,775,000	$124,281,800	$235,056,800
1889	123,489,000	142,150,000	265,639,000
1890	118,848,700	172,234,500	291,083,200
1891	126,183,500	186,446,800	312,630,300
1892	146,267,000	197,220,500	343,527,500
1893	155,521,700	207,895,400	363,417,100
1894	170,000,000	180,000,000	350,000,000

In my estimate of $170,000,000 of gold for 1894, I think when the statistics are made up at the end of the year these figures will be found below rather than above the mark.

Now, when we see the product of twenty years ago (1874), which was $90,750,000 gold, $71,000,000 silver, and total $162,250,000, we can grasp the great strides being made in the production of the precious metals.

A glance at the column of the silver product shows in unmistakable clearness what a prosperous people we might be were the banking powers throttled in their efforts to fully demoralize silver.

Silver is the money of the multitude the world over, and the multitude must battle for it unceasingly; any curtailment of the precious metal product is retrogression, and even though we see a great building up of the gold returns, there is no reason in this, that the world's production should be deprived of its silver wealth.

As before stated, the more we mine, the more metal produced, the higher in the scale of civilization we move, as wealth gives the power to gratify enlarged desires, and enlarged ideas is human progress. ALMARIN B. PAUL, M. E.

San Francisco, August 15, 1894.

The "Attraction Particle."

Professor Schaefer announces the discovery in each tiny animal of a cell containing life, or what he terms the "attraction particle." When biologists discovered the cell principle of life they thought it impossible to subdivide these infinitesimal atoms, but the microscope has shown the existence of this small particle in each cell, which is itself a structure *sui generis*, having definite existence and a definite function of its own. It is almost as minute an object as it is possible to conceive. In the cell, which is magnified 1000 diameters, the central particle appears merely of the size of a pin point. Yet this almost infinitely small object exerts an extraordinary influence over the whole cell, which may be many thousand times its size. It initiates and directs those processes which result in the multiplication of cells, and indirectly, therefore, it is concerned in directing the general growth of the individual and ultimately the propagation of the species. It is shown, then, that the principle of life is contained in a particle a thousand times smaller than the smallest object which the best microscopes of a few years ago were able to perceive, and the latest name for the dissolved mystery of life is "attraction particle."

Ups and Downs of a Miner's Life.

The ups and downs of a miner's life are well illustrated, says the *Colonist*, in the career of William Barker, for whom the town of Barkerville was named, and whose funeral took place recently from the Old Men's Home, where for months he has lain seriously ill. The deceased was a native of Cornwall, being in his early life a sailor. He came to British Columbia in 1858, one of his shipmates on the long voyage round being the veteran Robert Ridley, who also shared with him the adventures and varying fortunes of his life in the mines. In partnership with the late Bob Dexter, Barker's profits for a few months ran into thousands of dollars a day, but so free was he with his money that he saved nothing for his declining years. To "Bill Barker" belonged the honor of sinking the first shaft "below the canyon," and at one time his fortune was counted by the hundreds of thousands.

The Lead Trust.

The Lead Trust was formed eight years ago with a capital of $90,000,000. It ran against the law in so many places that it dishanded about four years ago and was reorganized under the laws of New Jersey with a capital of $30,000,000. It tries to restrict the output and dictate prices to both the consumers of the finished product and the producers of the raw material. It took the Morey lead works in Cleveland, O., closed the works, discharged the employes, left the plant useless and raised the price of white lead to the people of Cleveland. It was that Lead Trust which caused the reduction of one-half the tariff on lead in the Wilson bill.

RECENT MEASUREMENTS show that Mt. Ranier, Washington, is 15,539 feet high, about 1000 feet higher than was supposed.

The Mineral Hydrocarbons.

NUMBER X.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

While it has been shown that natural gas has been known from the date of the earliest historical record, and was in use by the Chinese almost from time immemorial, yet it was unknowu iu Europe until the 17th century.

The physical properties of gas were also unknown until the time wheu the vagaries of alchemy were changing to moderu chemistry. The alchemists taught that metals were individuals and that the gases escaping duriug manipulation were their souls, which they were at first called. They were afterward named "spirits," a term still retained and applied to alcohol and certain other volatile substances.

Natural gas was discovered iu England about the middle of the seventeenth century, as far as I can learn.

In the Philosophical Transactions for the year 1667 (Vol. II, fol. 482) may be found the following paper by Thomas Shirley after returuing from a journey in 1659, in Lancashire, England:

"The people of this town (Wigan) did confidently affirm that the water of this spriug did burn like oyle, into which error they suffered themselves to fall for want of a due examination of the following particulars: When we came to the said spring and applied a lighted candle to the surface of the water, 'tis true there was suddenly a large flame produced, which burued vigorously, at sight of which they all began to laugh at me for denying what they had positively asserted. But I, who did not think myself confuted by a laughter grounded upou inadvertancy, began to examine what I saw, and, observing that this spring had its eruption at the foot of a tree growing on the top of a neighboring bank, the water of which spring filled a ditch that was there and covered the burning place lately mentioned, I then applied the lighted caudle to divers parts of the water contained in the said ditch, and found, as I expected, that upou the touch of the candle and the water the flame was extinct. Again having taken up a dishful of water at the flaming place, and held the lighted candle to it, it went out; yet I did observe that the water at the burning place did boyle and heave like water in a pot upon the fire, though my hand put into it perceived it uot so much as warm.

"This boyling I couceived to proceed from the eruptiou of some bituminous or sulphurous fumes, considering this place was not above 30 or 40 yards distant from the mouth of a coal pit there. And, indeed, Wigan, Ashton and the whole country for many miles compass is underlaid with coal. Then applying my hand to the surface of the burning place of the water, I found a stroug breath, as it were a wind, to bear against my hand.

"Then I caused a dam to be made, and thereby hindered the recourse of fresh water to the burning place. I caused that which was already there to be drained away, and then applying the burning candle to the surface of the dry earth at the same point where the water burued before, the fumes took fire and burned very bright and vigorous.

"The cone of flame ascended a foot and a half from the superfices of the earth. The basis of it was of the compass of a man's hat about the brims. I then caused a bucketful of water to be poured on the fire, by which it was perfectly quenched, as well as my companions' laughter was stopped, who began to thiuk the water did not burn.

"I did not perceive the flame to be discolored like that of sulphurous bodies nor to have any manifest scent with it. The fumes, when they burst out of the earth and pressed against my hand, were not to my best remembrance at all hot."

In 1727 a work—"Vegetable Statics"—was published by Dr. Stepheu Hales, in which he describes experiments made by him in the distillation of coal. From 158 grains he obtained 180 cubic inches of inflammable air.

In 1733 Sir James Lowtherland laid pipes from his coal mine in England and burned the escaping gases on the surface of the earth.

Iu the Philosophical Transactious, 1744 (Vol. 41, fol. 59), an experiment concerning the spirit of coal by Johu Clayton is thus recorded, 85 years after Thomas Shirley's experiments:

"Having seen a ditch withiu two miles from Wigau, in Lancashire, wherein the water would seemingly burn like braudy, the flame of which was so fierce that several strangers have boiled eggs over it, the people thereabouts indeed affirm that about thirty years ago it would have boiled a piece of beef aud that, whereas much rain formerly made it burn fiercer, now after rain it would scarcely burn at all.

"It was after a long-continued season of rain that I came to see the place and make some experiments, and found accordingly that with a lighted paper, though it were waved all over the ditch, the water would not take fire. I then hired a person to make a dam in the ditch and fling out the water, in order to try whether the steam which arose from the ditch would theu take fire, but found it would not. I still, however, pursued my experiments and made him dig deeper, and when he had dug about the depth of half a yard he found a shelly coal; and the candle being then put down into the hole, the air catched fire and continued burning. I observed that there had formerly been coal pits in the same close of ground, and I then got some coal from one of the pits nearest thereunto which I then distilled in an open fire. At first there came only over phlegm, afterwards a black oil, and then likewise a spirit arose which I could in uo way condense, but it forced my lute or broke my glasses. Once when it had forced the lute, coming close thereto in order to try and repair it, I observed the spirit which issued out caught fire at the flame of the candle and continued burning with violence as it issued out in a stream, which I blew out and lighted again alternately for several times. I then had a mind to try if I could save any of this spirit in order to which I took a turbinated receiver, and putting a candle to the pipe of the receiver whilst the spirit arose, I observed that it catched flame and continued burning at the end of the pipe, though you could not discover what fed the flame. I then blew it out and lighted it again several times, after which I fixed a a bladder, squeezed and void of air, to the pipe of the receiver. The oil and phlegm descended into the receiver, but the spirit still ascending, blew up the bladder. I then filled a good many bladders therewith and might have filled an inconceivable number more, for the spirit continued to rise for several hours and filled the bladders almost as fast as a man could have blown them with his mouth, and yet the quantity of coals I used were inconsiderable. I kept this spirit in the bladders a considerable time and endeavored several ways to condense it, but in vain; and when I had a mind to divert strangers and friends, I have frequently taken one of these bladders and pricked a hole therein with a pin, and compressing gently the bladder near the flame of a candle till it once took fire, it would then continue flaming till all the spirit was compressed out of the bladder, which was more surprising because no one could discern any difference in the appearance between those bladders and those which were filled with common air; but then I found that this spirit must be kept in good, thick bladders, as those of an ox or the like, for if I filled calves' bladders therewith it would lose its inflammability in twenty-four hours, though the bladder became not relaxed at all."

(To be Continued.)

Mining Titles.

Does a mine owner lose title to his property by allowing tribute men or leasers to work in his mine? This is a serious question and must be considered by all mine owners who have allowed tribute work to be done in their mine. This question is propounded to our readers, says the Virginia *Enterprise*, after an interview had with H. W. Tangerman, superintendent of the West Consolidated Virginia Miniug Company. Through Mr. Tangerman we learned of a suit now pending in the District Court of Storey county, which suit is set for trial on the 29th day of August. This suit is startling in its nature, insomuch that the plaintiff, Edward Chandler, sues the West Consolidated Virginia Company to foreclose two liens for the sum of $1,057 for tribute work performed upon the ground of the company.

Mr. Tangerman's story is as follows: Last year, when times were very dull and men could not get work because of the fact that all the mines were discharging men, he obtained permission from the president of the company for himself and Mr. Treglown to enter on the croppings of the West Consolidated mine and to mine and extract ore therefrom, providing they could find any ore that would pay to mine and extract. We were to make no expense to the company, because the mine was shut down under an injunction suit held against it in the California courts. They (Mr. Tangerman and Mr. Treglown) began work on the croppings about September, 1893. After they had been working several months Treglown was taken sick and put a substitute in his place by the name of William Thomas, he being a late arrival from Carson, with the understanding that he (Treglown) would pay the board of his substitute, and when ore was found he (Treglown) would retain from its proceeds all moneys advanced in board bills and other supplies. In the month of December following the West Consolidated Virginia mine started up work, after being closed down by an injunction suit for three years. They appointed him (Mr. Tangerman) superintendent. About a month previous to this time he made an arrangemcut with Edward Chandler, plaintiff in the lien suits, that he (Mr. Chandler) should take his (Mr. Tangerman's) place in the tribute working on the croppings. The terms of agreement were that he (Tangerman) should pay Chandler's board and lodging, and when ore was found he (Chandler) was to receive $1 per day after all other expenses incurred by working in the croppings had been paid. They (Chandler and Thomas) did not succeed in finding ore in paying quantities. Now Chandler and Treglown's substitute, William Thomas, have brought a suit against the West Consolidated Company, which was in no way interested in the tribute work, but had extended a favor to Tangerman and Treglown in time of need.

Mineral Land Rulings.

Hoke Smith, Secretary of the Interior, has issued the following circular of instructions to the local land officers:

In the matter of the selection, by railroad companies, of lands in satisfaction of their grants, the following rules and regulations will be observed in determining whether the lands selected are mineral or non-mineral lands.

1. Where the lands have been returned by the Surveyor-General as mineral, a hearing may be had to determine the character of the land, under Rules 110 and 111 of Rules and Regulations issued Dec. 10, 1891, controlling the disposal of mining claims.

2. Where the lands selected by the company are within a mineral belt, or proximate to any mining claim, the railroad company will be required to file with the local land officers an affidavit, by the land agent of the company, which affidavit shall be attached to said list when returned, setting forth in substance that he has caused the lands to be carefully examined by the agents and employers of the company, as to their mineral or agricultural character, and that, to the best of his knowledge and belief, none of the lands returned in said list are miueral lands.

Upon receipt of said list you will cause it to be examined and a clear list to be prepared of all lands embraced therein that are not within the radius of six miles from any mineral entry, claim, or location, which list shall be transmitted to the Department for its approval. If any of the lauds embraced in said list of selectious are fouud upon examination to be within a radius of six miles from any mining entry, or location, you will cause a supplemental list of such lands to be prepared and return the same to the Register and Receiver of the district in which they are situated, and notify the railroad company that they have been returned. The Register and Receiver will at once cause notice to be published iu such newspaper as shall be designated by the Commissioner of the General Land Office containing a statement that the railroad company has applied for a patent for the lands, designating the same by townships, and has filed list of the same in the local land office; that said lists are open to the public for inspection; that a copy of the same, by descriptive subdivisions, has been conspicuously posted in said land office for inspection by persons interested, and the public generally; and that the local land officers will receive protests, or contests, within the next sixty days, for any of said tracts, or subdivisions of land claimed to be more valuable for mineral than for agricultural purposes.

At the expiratiou of said sixty days, the Register and Receiver will return to the Commissioner of the General Land Office said supplemental list, noting thereon any protests, or contests, or suggestions as to the mineral character of any of such lands, together with any information they may have been received as to the mineral character of any of the lands mentioned in said list. After the same shall have been returned by the Register and Receiver, you will first eliminate from said supplemental list all the lands that have been protested, or contested, or claimed to be more valuable for mineral than for agricultural purposes, or concerning which any suggestion has been made as to their mineral character. The remaining lands you will certify to this Department for approval and patenting as agricultural.

In regard to lands protested, or contested, or claimed to be mineral, or concerning which any suggestion has been made, or report by the Register and Receiver as to their mineral character, you will order a hearing to be had by the local land officers in each case. After giving due notice to the persons furnishing such information, and to the railroad company, under the existiug rules and regulations of the Department concerning hearings in cases where the land has been returned as mineral land.

The railroad company shall pay to the Register and Receiver the cost of advertising said lands in the manner set forth.

You are further instructed that all lists which have been heretofore prepared in accordance with and rules, regulations or instructions of the Secretary of the Interior, where such rules have been complied with (such as furnishing affidavit showing the nonmineral character of the lands in accordance with instructions of the Interior Department), and such mineral affidavits furnished for each subdivision of forty acres shall be excepted from the terms of the foregoing instructions. Also, where lists of selections are now pending of lands returned by the Surveyor-General as mineral, where hearings have been had in accordance with rules 110 and 111 of Rules and Regulations of Dec. 10, 1891, above referred to, and the local officers have determined that said lands are now mineral in character, and such determinatiou has been approved by the General Land Office. Such land shall be submitted to the Department for approval without further investigation although they may be within six miles of any mineral claim or location, unless since said hearing mineral claim or locations have been made of any tract embraced in said list, in which event you will eliminate said tract embraced in said list, and hold the same for further investigation.

A Legal Dispute.

The case of the Cassel Gold Extracting Co., vs. the Cyanide Gold Recovery Co., is on trial in London, England. The plaintiffs claim that the defendants infringed on their rights in the ownership of the MacArthur-Forrest patent by employing a process of obtaining gold and silver from ores, consisting in dissolving them out by treating the powdered ore or compound with a solution containing cyanogen, or a cyanide, or a cyanogen-yielding substance, substantially as described and claimed in the specification and ask the usual relief in a patent action. The defense in general is a claim that the MacArthur-Forrest invention or discovery was not subject matter for a patent and that the process was largely a matter of public knowledge.

The plantiff's counsel in opening the case said that since the issuance of the patent in 1887 between 600,000 and 700,000 ounces of gold had been successfully extracted by the process, principally in South Africa, having a value of $12,500,000 in money, and royalties had been paid to the extent of £117,000 in connection with the process. The first claim, he said, was for the use of cyanogen in the way described, and the second for a particular proportion of the cyanogen in the dilute solution. He said there was no dispute as to what the defendants had done; the sole dispute was as to the deduction from those facts. The defendants had erected an experimental laboratory. They advertised for persons to come and have their ores tested by the Pielsticker process, Pielsticker being a gentleman who had purported to invent the infringing process. The defendants permitted his clients to inspect what was being done at the laboratory of Mr. Harland. The suggestion was that they were not working to obtain gold by the dissolving action of the cyanide of potassium, but by electrical action, which had the effect of extracting the gold from the ore electrically, and not by the process Messrs. Forrest and MacArthur had described. The plaintiffs' case would be that electricity did not add anything to the dissolving power of the cyanide of potassium; in other words, that the gold which was extracted was in the defendants' process got out by the dissolving action of the dilute solution in exactly the same way as in the plaintiffs' patent.

Several witnesses for the plaintiff gave testimony: Jas. Dewar, Roberts-Austen, Lord Kelvin, E. J. Mills, Robert Tatlock, Geo. Gore, Sir Henry Roscoe, Louis Janin, Prof. Crookes. John Stewart MacArthur, F. I. C., one of the patentees, said that in 1886 he began the chain of experiments which led up to this patent. Before he experimented he had no kuowledge that the cyanide of potassium could be practically used to extract gold from ore. Persons would not, he believed, have been led to that by the alleged anticipations. There was no known practical means of extracting the gold from tailings which were, comparatively speaking, poor in gold. At that time the residual gold was going to waste. By their method ore containing 3 dwts. of gold, or one part in 200,000, could be profitably worked. Witness then detailed the various experiments made before the taking out of the patent. Until his experiments he had no knowledge that cyanide of potassium would dissolve the gold in ore. He agreed with the other scientific witnesses that it was the fact that a dilute solution had a selective action, having verified that fact in the course of his experiments. He understood Rae's process to be a simultaneous dissolving and depositing process. It was within his knowledge that Rae's patent was unworkable, and, in his opinion, nobody would have been led to the dissolving of gold by cyauide of potassium by Rae without the use of electricity. Taken to Pielsticker's process, witness said that he went to Mr. Harland's place of business and saw the defendant's apparatus. He had experimented to see whether the electric current had any effect in dissolving the gold in the ore, and found no beneficial effect. His results showed that the dissolution of the gold out of the ore was not assisted by the electricity. On some ores his process would operate better than on others, but it was applicable to all ores. The conclusion that the electricity had no effect was arrived at from the fact that there was as much gold left when electricity was not used as when it was.

For the defense Claude Vatin, R. H. Harland, G. Riley and James McTier appeared. The latter said that in 1887 the fact that the cyanide of potassium would dissolve gold and silver was well known. There was no invention in the application of that knowledge to gold ore. Witness was present at the experiments of the defendants, the results of which, he said, were that the gold was dissolved more rapidly when electricity was used. Rae's process would be effective for getting gold into solution, but it was impossible that it could be a financial success because of the difficulty of getting the gold out of solution. Cyanide of potassium had been reduced in price from 17s. per ℔. to 1s. per ℔. Faraday disclosed as much as any of the extracts relied upon in the particulars of objection, but in chemical literature there were more specific references to the solubility of gold in cyanide of potassium than those which the defendants relied upon. In 1885 the price of the cyanide of potassium he would use for this process would have been 2s. 6d. per pound. He considered that the electrical pressure and current with which Lord Kelvin worked was too small to produce any electrical result. In 1887,the process of getting the gold out of cyanide by zinc was not practicable—that was to say, only some of it could be got out. Witness had never tried the Pielsticker process.

Gold-Mining Concessions in Mexico.

The following has been sent officially, with a request for publication:

The Executive is hereby empowered, during the period of one year dated from the promulgation of this law, to make contracts for the prosecuting and operating of gold mines and placers, in accordance with legislation now in force, and subject to the following conditions amendatory to said legislation:

First. The contracts shall be in the form of concessions, which the Executive shall issue freely, and upon the hypothesis that it is in possession of data sufficient to justify the belief that such concession is to cover the mining of gold in the district to be developed.

Second. For the purpose of this decreo, gold-mining regions shall include deposits of that metal, whether alluvial or not, as well as deposits whercin the gold is found mixed with some other metal, but where the commercial value of the gold exceeds that of the other concomitant metals.

Third. No region shall be considered as gold-hearing if the average show of metals in all tbe mines included therein yields less of gold than expressed in the foregoing paragraph.

Fourth. As soon as the nature of the ore changes in such manner that the average yield mentioned in the foregoing paragraph is not realized, the contracts granted under this law shall be revoked.

Fifth. Each contract shall clearly specify the limits of the tract to be developed.

Sixth. Within the limits of such tract, the concessionaires can designate and acquire as many claims as can he located upon unoccupied territory, or incorporate therein claims belonging to the concessionaires prior to the date of the contract, as well as any others they may hereafter acquire by purchase or other legal manner.

Seventh. Concessionaires shall obtain prospecting permits, subject to the laws in force, all other companies or private individuals being inhibited from prospecting in that district for any kind of metals, but with the proviso that such permits shall be good for six months and no longer, and that, once lapsing and during the two years immediately succeeding, neither the concessionaires nor any other party can obtain such exceptional prospecting permits.

Eighth. The concessionaires can import into the Repuhlic, free of import duties, the machinery, instruments, tools and necessary apparatus for the purpose of prospecting and development of materials of construction for mines and metallurgical offices, provided such concessionaires first advise in each case with the Department of the Treasury, and abide hy the regulations therehy imposed. Should the concessionaires sell a portion of all the supplies thus imported, without the consent of the Government, they shall lose all such supplies thus sold and forfeit also all the franchises granted in the concession, unless such sale he rendered necessary hy hankruptcy or liquidation.

Ninth. The concessionaires shall enjoy a rebate on the annual mining tax for a period up to ten years, paying in the first year at the rate of one-tenth of the impost in force, and an increasing amount each year until the full tax becomes payahle in the eleventh year.

Tenth. During ten years time the concessionaires shall be exempt from all federal impost, with the exception of the tax alluded to in the foregoing article, and with the exception of taxes payahle in stamps and mintage and assay taxes or dues.

Eleventh. The concessionaires shall invest in their undertaking during the first three years a capital of $500,000 at least, to he increased to $1,000,000 during the following five years.

Twelfth. The concessionaires shall, within the time and the terms designated in the contract, present the plans, samples, ores, descriptive reports and geological specimens resultant upon their prospects.

Thirteenth. The concessionaires shall allow an inspector, appointed and salaried hy the Executive, to examine the work of prospecting and mining.

Fourteenth. The concessionaires shall guarantee compliance with their obligations by a deposit, in minimum, of $10,000 in bonds of the public debt, to he furnished at the time of signing of the contract, which they cannot redeem until they have proven the inversion of capital (see Article II) of at least $200,000. If the honds deposited bear interest, the depositors shall withdraw the coupons in due time for collection.

Fifteenth. The exemption from imposts mentioned in the ninth and tenth articles do not include the mining of alluvial gold. In such case, the concessionaires, if discoverers thereof, shall pay, during the mining of such alluvial gold, at the rate of one-third of the imposts in force.

Sixteenth. Within two years from the date of this contract the concessionaires sball establish a metallurgical establishment, capahle of treating at least 400 tons of ore per week, or, in place of such establishment, any other concern capahle, in the judgment of the Secretary of Publie Works, of such amount of work.

New Specimens Received.

The specimens added to the collection of the State Mining Bureau since June 23d, the date of last notice, are eighty in number, among which may be mentioned as of special interest the following:

Copper ore, chalcopyrite of good quality, from a new discovery at Eden valley, Mendocino county, Cal.; W. P. Thomas.

Twenty-six specimens of various crystallized minerals; J. Z. Davis.

Gold quartz from a numher of mines in San Diego and Riverside counties.

Ullmannite and other rich nickel and cohalt ores from Nevada; J. A. Yerrington.

Rich ore, silver and gold, from the 3250-foot level of the Savage mine, Virginia City, Nevada, the deepest workings on the Comstock lode which yielded ore; J. A. Yerrington.

Splendid specimen of stalactitc limonite from Shasta county, Cal.; Chas. Camden.

Very fine crystallized cinnahar from the Silver Bow mine, Napa county, Cal.; M. G. Rhodes.

A very curious compound fossil tooth from Kernville; Benj. T. Price.

Gold quartz from Riverside, Tulare, Fresno and Madera counties.

Several specimens from the Diadem mine, Plumas county, and vicinity; J. A. Edman.

Rich silver ore and chalcostihite, Butte and Boston mine; Montana; from the company.

And many others.

Not Going but Coming.

A correspondent of the Sonoma *Democrat* makes the following truthful remarks about mining:

As a rule you can tell by a man's conversation what branch of mining he follows—when a man talks about dips, spurs and angles you know he is a quartz miner; when his whole discourse is about the pitch of the bedrock, old channel and "an ounce to the pan" you can bet on him as a 49er and would not give a nickle for the best quartz ledge in the State. But as I have been in other camps I will talk about all kinds of mining perhaps. I have heard it remarked frequently when in the cow countries that the mines were played out and the future of California was entirely in her agricultural resources—a greater mistake was never made. Mining of all kinds is ouly in its infancy here. There are thousands of miles in length, if struug out in a straight line, of quartz ledges that, with the application of electricity and a large plant of 60 to 100 stamps, will yield large returns for ages to eome; and the rivers of California, with a fall of many thousand feet between the summit of the Sierra Nevada and the sea level, will produce enough power to run a million stamps so long as water runs down hill, and now power by electrieity ean be transmitted 100 miles successfully. Mining is the coming industry of California, but must be carried on by strong men, both mentally and finaneially. The days of the "grass root" miner have goue by, I am sorry to say. Then there are the ancient river channels where for many conseeutive miles no man has seen the bottom; that kind of mining will boom once more. There is gold by the ton in these old river beds, but no poor man dare attempt to open them up; the sun has set on the poor mau's day. The time was wheu four good determiued youug men could stake out a tunnel elaim and not have a dollar and go to the nearest "grub store" and be a perfect stranger to the merchant, tell him where they were going to prospect aud ask for, and get, all the credit they wanted for tools, powder and grub, commenee work and work away for weeks and even years, running for the channel. "Honest Miner" was the word. He cooked his own grub and patched his own overalls with the flour sacks branded Self Risiug. Yes, those were the days of old, but the demand for gold will be so great that men of wealth will hunt up the old timers and euquire how deep this or that shaft or enclosure was when the water run them out forty years ago, how and why a certain gulch paid so big, and if you can find a pioneer without a theory you can find a "white raven." Electricity generated by the rivers of the State must do the work and when that day does eome the mountaius will be like a hive of bees in May; but before that can take place Congress must make the provisiou or reservation of mineral from all agricultural patents, availablc for miners, and then look out for a boom in miuing.

Gravel or placer mining has not shared equally in the mining boom with quartz for several reasons. Men who are uot exclusively miners, and some of them in Santa Rosa, have put their money into tunnel claims and commenced work and followed it up with commendable energy, but they started wrong, and perhaps employed incompetent men to direct the work, consequently disappointment has followed in nearly every case. They have located or commeneed the tunnel by *guess* not knowing where the extreme bottom of the old river bed was; some of them are too low perhaps, and have run entirely nuder the channel, others too high and find to their sorrow that they can't drain the water by many feet and have abaudoned the enterprise and quit in disgust, and eurse the miner when the fault is all their own. The base of the Table Mountain furnishes hundreds of just such examples to my personal knowledge, but the gold is there to delight the eye and cheer the heart of the meu who will combine skill, money and energy in the near future.

The State's Oldest Miner.

The Colfax *Sentinel* makes the claim that Placer county has among her residents the oldest miner in California, in the person of Fred Howell Sr., at the Hidden Treasure mine at the Sunny South, Placer county. He has followed the business of mining since he was six years old. He is now sixty-five years of age, and the period during which he has been a practical miner is a trifle over fifty-nine years.

Mr. Howell is a native of Wales aud eommenced his active work as a gatekeeper in a eoal mine in his native land. At the age of tweuty-five he came to Placer county (in '54) and has followed gold mining with varying success ever since. For the past eleven years Mr. Howell has been a shareholder in the Hidden Treasure mine, and for the past five years he has superintended the sluice washing and the clean-up. Miners of a riper age who are still in California are numerous, but we believe this veteran miner can justly claim the distinetiou of having spent more years in active mining than any other person in the Goldeu State.

Scientific Progress.

Force of Gravity.

Prof. Mendenhall, of the United States Coast and Geodetic Survey, has under way a series of experiments to determine the force of gravity at different points throughout the country. As is well known, the force of gravity varies at different places at the earth's surface. At the equator it is less than at the poles; on a mountain it is less than at the sea level. The force of gravity is required to be measured for several purposes. A knowledge of its force at a good many points throws valuable light on the exact form of the earth. Then, again, certain experiments made at one place cannot be utilized at some other place, unless the force of gravity at the two places be known. For instance, the weight of a given volume of air as weighed at Paris or at Munich, cannot be compared with its weight at San Francisco till the force of gravity is known at the three places.

The method of making the experiment is to compare the time of swing of a pendulum with the time of swing of the same pendulum in a place where the force of gravity is known. This is a matter easy to understand as to purpose, and very complicated and difficult to accomplish accurately. One pendulum might be injured in travel, so three are carried and used at each place. The varying weight of the air affects the time of swing, so they are swung in a vacuum. Varying temperature affects the length of the pendulum, so the temperature has to be carefully measured. No clock or chronometer can be trusted, so time has to be determined by observation of the stars. Each of the three pendulums is swung with first one and then the other side to the front, and for eight hours in each position, and the number of swings in each position for each pendulum is determined, though it is not necessary actually to count them. So forty-eight hours, provided that cloudy nights do not interfere with the observations for time, may suffice for one determination.

The party have made one determination at Deer Park, Md., at an altitude of 2700 feet. They will make a determination at Chicago, and then two in the Yellowstone National Park. One will be in the heart of the volcanic region of the park, and one near the Grand canyon of the Yellowstone. There may well be some anomaly there, owing to the nature of the underlying rocks; if so, other adjacent stations will be occupied, so as to get some insight into the nature or extent or causes of the anomaly. Other determinations are then to be made at Salt Lake City, at Green River valley, at Grand River Junction, at Gunnison, at Denver, at Colorado Springs, at Pike's Peak, and, if time allows, at two or three locations on this coast.

Uses of Photography in Business.

Amateur photography is with most people purely a diversion, the means producing diversion or else recording diverting experiences. Whether one takes pictures or souvenirs of pretty places not soon to be revisited, or of occasions not likely to be repeated, or whether he makes lantern-slides for parlor entertainments, the prime idea of the artist is usually his own or some one else's pleasure, and is quite dissociated from his regular business. It has long been apparent, however, that the art of photography is one of such great practical use in all lines of industry that every wide-awake and progressive man ought to acquire it, just as he would acquire skill with a typewriting machine, or even with a pen. The newspaper writer is thus enabled to illustrate his report of novel inventions, strange scenes and awful catastrophes. The lawyer thus procures indubitable testimony. The civil engineer's assistant goes out and thus procures for his chief a faithful description of a broken bridge or burst dam. And so on. These uses are rapidly multiplying, and the application of the camera thereto is steadily becoming more frequent.

In the *American Machinist* there is mentioned a good instance of this kind. At the Builders' Iron Foundry, in Providence, while a large steel casting was being drilled, the drill broke. The machinist attributed this mishap to a blowhole in the casting. Of course, on general principles, the foundrymen evinced skepticism, but the metal was split open and a photograph taken. This revealed a serious defect in the casting. The picture was sent to the foundry, and the argument closed. In the same establishment every difficult piece of work is photographed at each stage of progress, so that if a similar order has to be executed later, and especially if new foremen are employed in the shops, it will be possible to recall details perfectly.

The New Method of Photographing in Colors.

Considerable attention is being paid in Paris to the new method originated by a member of the National Academy of France for photographing in colors, the process being pronounced, from a scientific point of view, the most interesting ever invented in this line. Briefly, the operator lays upon a sheet of glass a very delicate, translucent film of chloride of silver, and against this film is placed a vessel containing mercury, so that the latter is in contact with the film. Thus arranged, the glass sheet and mercury are placed in the camera like an ordinary sensitive plate, and, exposures being made, the image of the object to be photographed is projected upon the glass, the light conveying the image passes through the glass, on through the translucent film, and is reflected back by the mercury behind. The action of the light splits the silver in the film into thin layers, which breaks up the light rays into their component colors. As the play of colors in an opal is due to that gem being composed of layers of quartz superposed one upon another—these layers breaking up the light into different hues—a similar result follows the placing of the layers of silver in the film, which, through the operation of a curious law, reproduces the tints of the object photographed.

Gold Leaf.—Specific Gravity.

At the last gathering of the Royal Society of England J. W. Swan showed some specimens of gold leaf prepared by him, which are only .000004 inch thick. They are made by electroplating with gold on some of the wonderfully thin sheets of copper that Mr. Swan produced in a similar manner some years ago. After the gold had been deposited the copper foil was dissolved away by perchloride of iron, leaving only the gold. The gold leaf so prepared has a thickness of from one-fifth to one-tenth that of the thinnest films that can be produced by the old fashioned process of beating.

Prof. C. V. Boys showed photographs of the apparatus used by him to determine the average specific gravity of the earth, the apparatus itself being too delicate to be brought to the hall for exhibition. His method is substantially the same as that used by Cavendish, a century ago, except that the present apparatus is far more delicate and accurate. Professor Boys has been working on this problem for five years, and he finds that the specific gravity of the earth, taken as a whole, is 5.527. It is believed that this result is correct to within one-fiftieth of one per cent.

With a Mergenthaler Linotype machine, which casts a whole line of type from molten metal in response to the operator's manipulation of keys resembling those of a type-writing machine, it is now possible to measure a man's work without taking a printed impression on paper of the matter thus set. William C. Harding, of the *Boston Herald* composing-room, has invented an automatic register which keeps tally of the number of lines, and hence of the "ems" turned out.

Educational.

MINING

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

Belmont School,
BELMONT, CALIFORNIA,
25 Miles South of San Francisco.

BUILDINGS heated from a central steam plant, and buildings and grounds lighted by electricity.
BOYS perform their own experiments in well-equipped chemical and physical laboratories.
GYMNASIUM 20x70 feet, furnished with very best apparatus, including shower baths, under special teacher of physical culture. . . . .
SCHOLARSHIPS for young men of fine character and ability. Accredited at Stanford and at the University of California in all the subjects of all the courses and in advanced physics, chemistry and mathematics. . . . . .
REFERENCES required. Views of Belmont School and Catalogue sent by applying to **W. T. REID, A. M.** (Harvard), Head Master. . .

ACTUAL BUSINESS PRACTICE.
Established 1863.
PACIFIC Business College, 320 POST ST. SAN FRANCISCO.
Day and Evening Sessions.
Rates of Tuition Very Moderate.
Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, President.

HEALD'S
Business College,
24 Post Street, - - - San Francisco.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

ESTABLISHED 1860.

Patent Agents,
220 MARKET ST., SAN FRANCISCO.
Reliable Advice.

A LARGE, VALUABLE
Gold Mining Property
FOR SALE CHEAP.

A GRAND OPPORTUNITY NOT EASILY DUPLICATED. Actual value many times the price asked.
Situated in Nevada County, California, and consists of a group of four mines, all strong, heavy veins. Only partially developed. Ore free milling. Over $90,000 past yield of ore from one mine alone.
Must be sold within 30 days to close out an estate. Price, $30,000. Terms, $5000 cash; balance easy installments, or 20 per cent of gross proceeds, to suit purchaser.
Machinery on the ground worth cash payment asked. For prospectus and particulars, please address:
S. B. FOWLER,
Grass Valley.....California.

Professional Cards.

Mechanical Progress.

A New Rust and Scale Preventive.

Nearly every man in charge of a large steam boiler, in either a steamship or a stationary plant, is visited every week or two by somebody who has a new remedy for scale and rust which he wants to sell, or at least to have tried. It would be unjust, perhaps, to declare that none of these have much merit, but it is safe to say that not one has yet been generally accepted as a satisfactory means of attaining the desired end. Hence the field is still open to inventors. Charles Law, of Pittston, Penn., may have a first mortgage on it, though, for he has just patented an idea looking to that end, and it has been received with favor by some of those who have tried it.

The principle of Mr. Law's invention is electrolysis. In an ordinary zinc and copper battery the sulphate is analyzed by electric action, the acid going to one pole and the metal to the other. By placing a lot of zinc inside his iron or steel shell, Mr. Law provides for a similar operation, though it goes on more slowly. The oxygen and hydrogen of the water are dissociated, the latter escaping in the form of gas and the former combining with one of the metals. In making such combination, however, the oxygen must go to the zinc, the positive element in such a couple. But if the oxygen is prohibited from combining with the iron or steel, then the latter cannot rust, for rusting is nothing but oxidization. Mr. Law claims no novelty up to this point. The hanging of zinc plates in steamship boilers is an old story; but by pulverizing that metal and inclosing it in a perforated cannister or cartridge, he gets a greater superficial area within a much smaller compass; and by adding to the zinc another substance, which serves as a "quickener," he says that he promotes electrolytic action in cold water as well as warm. What the quickener is, though, he does not care to say. This inventor, who, by the way, has for years been so connected with mining operations as to be familiar with the peculiarly destructive effects of water in mines upon boilers there, further claims that if one can keep the iron or steel of the boiler from rusting, the incrustation of that metal with lime (if there be any in the water) will also be prevented, and the lime will be precipitated in loose particles. He has made special experiments which lead him to that conclusion.

The Cunard Line is said to have experimented with Mr. Law's system on the Campania, and to have gotten better results therewith than with zinc plates. The cartridges for this test weighed about fifty pounds.

WHILE people are inventing, asks a writer in the New York *Critic*, I wonder why they don't invent something to make typewriting machines noiseless. I have been racking my brain to think of something, but all my suggestions are set aside with scorn. When sewing machines were first invented they were as noisy as a fire engine under full head, but now they are as noiseless as a cable car when the gong is not ringing. I have great faith in Yankee ingenuity, and believe that the noiseless typewriting machine is only a question of time, and not a very long time, either.

A NEW TROLLEY WHEEL has been introduced which has provision for lubricating with oil, in additiou to the graphite bushing. The hub is furrowed out on the inside, aud felt packing is tucked into the recess. The felt is kept saturated with oil, which also permeates the graphite and so reaches the spindle.

THERE is a demaud in the rural districts for a telephoue that can be attached to and worked with a barbed fence wire from men who are obliged to go about on their ranches inspecting fences for breaks. They sometimes wish to report and call for materials for repairing damage when twenty or thirty miles from headquarters. They are now compelled to ride back in person. A salesman of electrical apparatus says that if a good telephone was put in much time and trouble would be saved. "The staples holding the two top wires to the posts could be removed, insulators put in their places, and a man would have a complete metallic telephone circuit around his ranch.

Made a Discovery and Lost It.

A Chicago electrician found an art only to lose it. For a long time he had been experimenting with wires for incandescent electric lamps. In the ordinary incandescent lamp the vacuum is not perfect, the wire burns away and the film of soot forms on the inside of the glass. The electrician hoped to make a wire which would have more "resistance" and last much longer; hence, to his joy, he succeeded. He made one lot of wires which, being placed in the vacuum lamps, lasted five times as long as those that were and are now in general use.

The discovery meant a fortune. He made arrangements to manufacture the lamps on a large scale, but when he made another lot after the same process it was a failure and would not serve the purpose. He tried again and again, but to this day has never been able to duplicate the successful ones. There might have been some accidental ingredieut, some little difference in the method of manufacture, that made this one lot a great success. The electrician is not disheartened. He is working away, attempting to rediscover his discovery.

A BOSTON man has patented a steam bicycle. The boiler is placed between the wheels and is only a few inches thick. The steam cylinder on one side is connected by a rod and crank with the forward wheel, while the steering is done by the rear wheel. The rider sits above the boiler, which he straddles, and steers with one hand, while he works the throttle with the other. The appearance he would present iu case of a boiler explosion would be an anatomical curiosity.

THE last census report gives $36 per horse power per year of 313 days at ten hours per day as the average cost of steam power in the United States. This is equal to 1.15 cents per horse power per hour. It is reported that power is being contracted for at Niagara at from $8 to $24 per horse power per year of 365 days, counting twenty-four hours to the day, no additional charge being made for nights or Sundays, as the waterfall "goes on forever."

WHAT is called the Kinetic motor for street cars has been tried lately in Chicago. It is really a steam engine, but at the start the boiler is filled with superheated water and the furnace is supplied with red-hot anthracite coals, so that the preliminaries of lighting a fire and getting up steam are dispensed with. The apparatus is said to require little attention, and one charge will last for about twenty miles of service.

SENATOR COCKRELL'S bill to promote aerial navigation authorizes the appropriation of $100,000 for payment to any iuventor in any part of the world who shall, at any time prior to the first of January, 1900, construct a vessel that will demonstrate the safety of navigatiug the air at a speed of thirty miles au hour, aud capable of carrying passengers aud freight to the extent of five tons.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, lessee, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

CALIFORNIA.

Amador.

A MINING SUIT.—*Ledger:* A mining suit of great importance, and involving questions of mining law which will make it extremely interesting to mining people generally, is about to be commenced in Amador county. The case involves the question of trespass on the part of the Kennedy Mining and Milling Company on the ground of the Argonaut Mining Company, which lies south of and adjoining the Kennedy mine. The Argonaut people claim that the Kennedy Company has stoped out the Argonaut ground in many of their levels, taking out a large quantity of rich quartz, and will sue for an amount of money that will take several ciphers at the right of a large figure to express. The papers in the case on the part of the plaintiff will probably be filed in a few days.

The stockholders of the Bay State Mining and Development Company held their annual meeting at Plymouth on the 4th inst., and the following officers were elected: Wash Marion, president; W. A. Jones, vice-president; W. A. Jones, W. T. Jones, T. B. Slevin, D. E. Hayes, G. W. Easton, directors; W. T. Jones, superintendent; F. E. Luty, secretary; A. J. Coster, assistant secretary. The reports of the superintendent for the past year show the affairs of the company to be in a flourishing condition, with prospects for a grand future. It is the intention of the company to at once erect a ten-stamp mill of the latest pattern. By consent of over two-thirds of the stockholders, the office and principal place of business will be removed to San Francisco.

All negotiations between the Haywards-Lane mining combination and the Gover people are off. Haywards telegraphed to his representatives in Amador county a few days ago, saying that if the agreement was not signed by all the attaching creditors by a certain date he would withdraw his proposition. The agreement was not signed and the negotiations were withdrawn.

FAVORABLE OUTLOOK.—*Record:* The mining outlook for Sutter Creek is bright. New developments are being made. The Wildman and the South Eureka mines are improving in appearance with each succeeding day. It is expected that the Mahoney mine will be put in working order in connection with the adjoining property—the Wildman. The Mahoney has on it a forty-stamp mill and is well equipped for immediate work.

The Kennedy never varies—except to improve—in pouring out its usual monthly output. The Keystone at Amador moves along in its usual way, and with its big monthly payroll adds largely to prosperity of that section. Alvinza Hayward and his partners have taken hold of the Gover mine. The Mayflower group of mines, under the superintendency of Dr. Emmons, is gradually getting in shape for effective work. The company have now from thirty to fifty men on its payroll.

Mono.

MONO'S "EGYPTIAN" PORPHYRY. — The Bridgeport *Chronicle-Union* says Mono county has within its confines that which are more valuable than gold mines—an immense quarry of "Travertine," and a mountain of "Egyptian porphyry." The former is located within one-half mile of Bridgeport, and the latter within striking distance. The travertine is the only known deposit outside of Italy, and the porphyry outside of Egypt. The former has been sold by W. E. Lindsey to San Francisco parties, some of whom are interested in the latter with Mr. Lindsey, who located the porphyry discovery last week.

ANOTHER DISCOVERY.—Bridgeport *Chronicle-Union:* W. E. Lindsey arrived from Carson on Thursday and departed yesterday morning to make a location of another important and most valuable discovery in Mono county, within a few miles of Bridgeport. The discovery is the only one known outside of Egypt, and is immensely valuable, it being what is known as Egyptian porphyry.

Nevada.

A BORING MACHINE.—*Transcript:* A portable engine weighing 7200 pounds, and consigned to the Derbec Mining Company, left this city this morning drawn by Grissell's big six-horse team. The engine is mounted on wheels and is provided with a seat for the driver of the team. It will be used to run a boring machine.

The Derbec Company intend to prospect, by means of this boring machine, the old Watt ground and the Dc Noon ground. It is believed that there is rich gravel there, and if the prospects confirm this belief the company will probably purchase these properties and proceed to develop them on an extensive scale.

Boring machines have never been used in this county, but they have been employed with good results in prospecting gravel channels in Placer and other counties. The success of the experiments soon to be made by the Derbec people may induce other companies to adopt the boring process in prospecting their ground.

Plumas.

FROM LONDON. — *National Bulletin:* On Tuesday, J. W. Moyle, superintendent of the Slate Creek Gravel Co., arrived from Sierra City, accompanied by A. Morley Fletcher, who is direct from London and comes to look after mining in Plumas and Sierra counties. Mr. Fletcher is a director of the company which owns the Bonanza mine near Sierra City, also of the Slate Creek Gravel Co., whose property embraces three and one-fourth miles of the bed of Slate creek between Gibsonville and La Porte. This creek bed is filled to the depth of over twenty feet with rich deposits from the great gravel mines of that section operated since 1850. In these deposits are lodged millions of gold. It certainly ought to be one of the best mining propositions in the State.

San Joaquin.

COPPEROPOLIS TO THE FRONT.—Stockton *Record:* If, as stated, the copper mines of Michigan have been exhausted, it will direct users of the metal to the mines of Copperopolis, that have as yet taken out but a very small fraction of the ore in that locality. Until recently the process of reducing the ore has been very expensive, but by use of a lately discovered electrical process the cost has been materially decreased. The Michigan mines have always been the greatest bar to the success of their California competitor, and now that they are a thing of the past, Copperopolis can be expected to appear as she did in the palmy days of yore, and night and day shifts of hundreds of men will once more populate the pretty little mountain city that has existed of late years from the simple reason that it could neither get away from itself or anybody else.

Shasta.

THE BALAKLAVA MINE. — *Free Press:* S. Weil has succeeded in interesting capital in this mine, and was up there to ship 15 tons of ore to Selby for a milling test. The ore was sent to Copley on mules from whence it was shipped by rail. The ore will go about half and half in gold and silver, and the gold will pay the cost of production. As soon as things get in shape, the railroad company will be induced to put in a switch at the mouth of Squaw creek, from which point a good road will be constructed to the mine.

Sierra.

SIERRA COUNTY MINES.—*Transcript:* J. O. Jones, superintendent of the North Fork Mining Company, which was recently incorporated for the purpose of mining in Sierra county, intends to start work on the company's gravel claim, west of Forest City. The Wisconsin adjoins it on the south. Previous to twelve years ago the mine was profitably worked for a number of years, and just before operations were suspended $40,000 was taken out from quartz stringers found in the claim. The rock was rich. The old workings have caved in and it will be necessary to run a new tunnel, which will probably be started from Lucky Dog ravine, a mile west of Forest City, and near the road. The tunnel will have to be run about 3000 feet to reach the channel; and, although it is a big undertaking, the company will rush the work forward as rapidly as possible. As soon as the channel is reached and breasting begins, a big force of miners will be put to work. The company owns between 600 and 700 acres, which takes in about a mile and a half of the channel.

The Ruby gravel mine is looking well, and thirty-five men are employed. They are working alongside the old Bald Mountain ground on the south. There is lots of new ground on the north that has never been worked. The company has been operating there fifteen or twenty years.

About thirty-five men are working in the Bald Mountain Extension. Since the present workings, near the old Pliocene mine, were reached about a year and a half ago, the mine has been paying.

GENERAL NOTES.—*Messenger:* Horace Tahor has his tunnel in the Gibsonville ridge some 2600 feet, and the face in the hardest kind of rock. He has an upraise from the face of the main tunnel up about fifty feet, which is also in very hard rock. His operations are watched with interest by the whole northern part of Sierra and southern Plumas, because his success means the resumption of life throughout both counties.

At the Thistle shaft over seventy men are employed. If this company had a tunnel into their ground instead of having to work through a shaft, they would have the biggest mine on the Pacific coast. They own about nine miles of the Gibsonville ridge, and all their ground is known to be rich.

Through bad management the gravel elevators, put in by Phil Doray's company, on Slate creek, are not a success. If the elevators were let alone they would be all right, but the ones in charge kept changing this and then that until the whole thing was a failure.

THE EMPIRE MINE.—Supt. Buckley tells the *Transcript* that the company intends putting up heavy machinery capable of working to any depth desired, and that when everything is completed they will have one of the best plants in that section. Machinery has been ordered and will soon be hauled to the mine, and all work will be crowded ahead with dispatch.

Maltman & Thompson will build reduction works for the company, and will attend to the working of the sulphurets.

The Empire has been worked for a number of years, on a small scale and with varied success, and it is the opinion of practical miners and experts that the property is valuable and will give good returns if operated on a more extensive plan. There is a large ledge of good quartz in the shaft. The mine is located in Gold valley, about eight miles above Downieville.

Upward of 100 tons of freight will he hauled to the mine within the next few weeks, and it is thought that before many months roll by there will he at least 100 men employed there.

The machinery is to be run by electricity, which will be generated hy water power obtained some distance away. This will he the cheapest and best method of operating the machinery.

Siskiyou.

MINING NOTES.—*Journal:* Austin & Co., of the Greenhorn blue gravel mine, are sinking a new shaft nearer the pay gravel and affording more fresh air in the drift channels, as the old shaft is about 360 feet from the present operations.

Fernandez & Co. had another cleanup after two months' run on Cherry creek last week, and brought to town 640 ounces of gold, as the result, which will he the last until winter comes again, owing to the water supply giving out. This is the second cleanup this season, the owners having realized over $10,000 on a former run. The claim is at the big reservoir just over the Deadwood mountain summit from Yreka, about seven miles distant, and will pay still better in future years, by reason of getting opened in better shape for securing the rich bedrock gravel in the old deep channels of the creek.

The Benz Bar and Fort Jones claims, at Klamath river, are almost in readiness for the work of washing to be commenced, and it is expected both claims will yield rich returns this season, although their opening is nearly two months later than usual, owing to the high stage of the river and the great amount of labor required in wing-damming. It costs big money, a vast amount of timber and lumber, as well as hard work, to turn the water off from the pay channel this season, by reason of the extra quantity of snow on the mountains and the cool weather keeping it from melting rapidly until after the 1st of July.

Thos. Rodgers, a Portuguese miner, cleaned up $6300 from the past spring and summer work at his claim on Canal gulch near Hawkinsville, within three miles of Yreka, and then sold his claim for $6000. He left for Portugal yesterday.

C. H. Jordan, lessee of the Adams quartz mine on Cherry creek, has been taking out some very rich quartz lately, which yields about $100 to the ton.

Cal Hughes returned from the Hungry creek mines, Siskiyou county, last Wednesday, says the Klamath Falls *Star*, with glittering specimens of quartz from the Tuscarora ledge. It is red ore, free-milling quartz, and has assayed $436 to the ton. The ledge runs from one to three feet wide, with its hanging-wall side of quartzite, granite on the footwall, and yellow porphyry on both walls. It is a very promising mine. The shaft is on the saddle of the hill, thirty-five feet deep, sloping southeast and northwest, the tunnel starting in on the northwest side 250 feet from the shaft, which it taps at a depth of 100 feet. The tunnel is now in 176 feet, leaving 74 feet from the shaft.

Trinity.

CHANGED HANDS. — Weaverville *Journal:* Beaudry & Co. have taken charge of the old Diener mining property at Minersville and will put about 25 men at work next Monday to build a wagon road from the town of Minersville to the mine.

NEVADA.

Washoe County.

BORAX WORKS.—*Journal:* The Reno Borax Company Works are now in successful operation. The marsh is situated in the extreme northwestern part of the county, near the California line. The works were started a few days ago by inexperienced men before the arrival of B. F. Gray, who has charge of the works. The result of the first day's work under unfavorable conditions was 900 pounds of crystallized borax, worth about 7½ cents per pound.

The result is very satisfactory to the company. The marsh is extensive and the industry promises to he profitable.

Nev Co

REOPENING THE MERRIFIELD—*Herald:* The Champion Company is developing the Merrifield on a large scale and may yet have a second Champion there.

It is practically a new mine for Nevada City. The old Merrifield Company worked the Deer creek end of their ground to a depth of 1000 feet and then quit. The mine lay idle, with improvements going to decay, for a number of years. It was finally purchased hy the Champion Mining Company, whose ground it adjoined, and when the Champion was shut up hy litigation the company turned their attention to the Merrifield. Last spring they started an incline shaft on the property, and now they have completed the necessary surface improvements.

The incline is a two compartment of easy grade, with pump shaft, and is now down 250 feet. At 200 feet the first level was made and drifting commenced. About 100 tons of quartz have already been taken out, and a five-foot ledge in the bottom of the shaft is supplying more. The drift is running into new ground never touched by the Merrifield Company.

The surface improvements are all good and substantial. The hoisting works is almost as large as the Champion's and the dump is high enough for all purposes. A large ore hin has been built, capable of holding 200 tons, and from this a track is being laid to the Champion mill. On the creek side of the hoist is a splendid site for a mill, if another should be needed. The building is lighted hy electricity.

About 25 men are employed and they are making good headway. The mill will be started soon.

OREGON.

Baker County.

MINING NOTES.—*Democrat:* The Rock Creek Mining Company, N. A. McMillan superintendent, is just now seriously considering the introduction of a chlorination plant in addition to a new mill. The mill used the past few months hy the company was owned hy the Robinson Mining Company and fell into the hands of Mr. P. Basche, who sold it, and it is to he taken away from its present site. This prevented its use hy the Rock Creek Company, and the Beckwith mine is now without a reduction plant.

Speaking of chlorination, it seems now to be well settled that this process is just the one to work the ores of this county, and why its introduction has not been made long ago at the Beckwith, Rohhins-Elkhorn and Baisley-Elkhorn cannot well be explained unless it be that in the cases of the Rohhins and Baisley mines the superintendents were not sufficiently acquainted with the merits of the process. The time is sure to come when chlorination will be in vogue generally in the sulphuret camps, and then some of the moss-back mine superintendents will wonder why they did not adopt it long before.

The owners of the Pyx mine now find themselves in full possession of about $17,000 worth of new and valuable improvements on their property—the result of the expiration of the bond on the mine held by J. G. Chapman and others. The mine is now in first-class shape for working.

H. Holcomb is equipping his mine near the Virtue with a reduction plant, and it is learned that the mine is making a splendid showing of ore.

Alexander Baring is still in London, England, in the interest of a reorganization of the North Pole Mining Company operating at Cracker creek. Development work on the North Pole mine continues, and several good ore veins have been cut in the long tunnel, upon which work has been in progress for the past year.

NORTH POWDER MINES.—*Democrat:* On the Baker side of the Powder river, about four miles east of the North Powder, M. Gutrie has bonded a ledge of free milling gold ore for $10,000, with $1000 down as a bonus. The mine is known as the Arizona, and the bonding was done by a Chicago firm. A ten-stamp mill is to be erected on the property at once, and, according to the specifications of the contract, Gutrie is to receive fifty per cent of the proceeds during the first six months. The terms of the contract are sufficient to give an idea of the probable value of the ore. Pittsburg, a claim alongside of the Arizona, is owned by a Salt Lake company.

THE ROBBINS-ELKHORN.—Supt. J. H. Robbins, of the Robbins-Elkhorn mine at Elkhorn mountain, brought to Baker City with him a gold bullion output amounting to $2000, the result of a twenty days' run. He is making large shipments of concentrates to Denver and Everett, Washington.

EUREKA AND EXCELSIOR.—*Democrat:* The Eureka & Excelsior mines at Cracker Creek, owned hy the Eureka & Excelsior Consolidated Mining Company, principal stockholders in which are St. Louis, Mo., people, have been leased by John Longmaid, of Salt Lake City.

COLORADO.

CLEAR CREEK COUNTY.—Silver Plume *Standard:* Mining in this county keeps up far beyond the expectations of a little over a year ago, when the price of silver dropped away down. At that time it hardly seemed possible that much would be done beyond working out what ore happened to be in sight, but as time rolled on and people became accustomed to changed conditions, they recovered from the panicky feeling and set about doing the best they could under the circumstances, with the result that the production of the mines is being kept up fairly well, and new enterprises are being planned and carried out in the way of developing old and new properties that shows that the industry is far from being killed, as it was feared that it would be. Of course there is nothing like the activity that there would he if silver commanded a better price, and the miner frequently gets but little or nothing for his toil; but, on the whole, there is enough money taken out to keep people alive and business going on. There are indications that the output will be increased rather than diminished hy the prospecting that is going on in many places.

Leadville District.

MEANING OF SILVER ACTIVITY. — *Herald-Democrat:* A prominent mining man who is largely interested in the silver mining industry was asked to explain the cause for a revival of interest in silver mining as indicated by the inauguration of various new enterprises. He gave the following explanation: Last summer there was great uncertainty with reference to the mining industry. The price of silver was low enough, but what made the situation much worse was the fact that the market lacked firmness and stability. In other words, the miner could not tell what the price of silver would he from one day to the next, the fluctuation being so violent and uncertain. Under these conditions mining naturally languished. No one cared to engage in any enterprises so long as the danger existed that silver might drop to 50, or even 40 cents. The fluctuation of the market was utterly beyond calculation, hence mining men preferred to adopt a waiting policy until such time as silver should reach its normal level. After the repeal of the Sherman law there were several vibrations of the pendulum of price, then gradually the figure settled at about 62 cents. Mining men were then reasonably certain that the price would remain at this figure. This was none too good, but it was better than the former uncertainty. With the assurance that silver would remain at 62 cents, leading mining men felt that they could, without pecuniary loss, engage in a certain amount of development work in territory known to he mineralized. This accounts largely for the various enterprises which have recently been inaugurated near the city, and which would scarcely have been undertaken last year with the silver market in a state of violent perturbation. They are satisfied that silver has reached its bedrock price and will go no lower, and that whatever influences are brought to hear will tend to enhance its value.

IDAHO.

SUMMIT FLAT.—*World:* Eight or ten men are at work sinking an incline in the Mammoth mine, on Summit Flat. The sawmill is cutting timhers, and it is believed that work will continue without cessation hereafter. The mine, although rich and large, had lain idle for a good many years. J. J. Taylor, formerly of Ketchum, is the superintendent.

THE SOUTH AFRICA.—The further west the drift is run from the bottom of the South Africa shaft the richer is the ore obtained.

That coming out will yield over $100 per ton. The east drift is in fifteen feet, where ore has been reached. The mill resumed crushing yesterday.

WILL TRY IT. Two of Lembi county's properties have long lain idle, viz., the Sandy Creek group of mines with its mill near Fort Lembi, and the mill and mines of the Pino Creek group near Shoup. Both properties are owned by the Lembi Mining and Milling Company, a corporation. The manager for the company, Mr. J. M. Parfet, has in the past few years used every legitimate effort to persuade the directors to operate at their own venture, but without avail. Failing in this, he has, in company with a few select miners, secured a lease and bond on the mines, and they expect to demonstrate to the company that their faith in the properties is well founded.

Tom Ball of Pocatello expects to achieve remarkable results with his gold saving machine, which he has been working on the Snake river. Three men in three days cleaned up $63, moving about thirty tons of dirt a day. Mr. Ball is making arrangements to purchase a dredge with a capacity of 1000 tons a day, to operate in connection with his machine.

MONTANA.

LIXIVATION WORKS STARTED UP. — *New Northwest:* President Paul A. Fuzz of the Bi-Metallic Company arrived in Philipsburg from St. Louis a few days ago, and last Saturday gave orders for the starting of the new lixiviation plant which has been in course of erection the past several months. The plant is put in for the purpose of working over the accumulated tailings from the amalgamation process. It has twelve ore vats of twenty-two feet diameter and ten feet depth, which will hold 151 tons each. Its capacity is 300 tons per day. Fires were lighted in the furnaces Saturday and everything in connection with the plant is now running in good shape. There is an accumulation of tailings sufficient to keep the works running steadily for eighteen months. This move on the part of the company is a godsend to Philipsburg, which probably has suffered to a greater extent than any other camp in the State from the slump in silver. In addition to the large number of men necessary to the operation of the works, a considerable number are employed in the big drain tunnel between the mine and mill, and the work is being driven rapidly, though it is not possible that it can be completed before May of next year.

NEW MEXICO.

DRY PLACERS.—Hon. Amado Chaves informs the Santa Fe *Republican* that during a recent trip to Dolores on official business he found about 160 men working there in the placers and making from $3 to $8 per day with dry washers. Those people are mostly Mexicans from the ranches of the Rio Grande valley, who have been practically ruined by the depreciation in the price of wool, and who have gone to Dolores to make money to support their families. Don Amado brought home a double handful of the dirt after it had gone through the dry washers and panned twenty-six good sized colors out of it, showing that while these people are making good wages they are saving only the very coarsest gold. In 1845, before the American occupation, there were more than 3000 people working in these placers, as the extensive workings still show. After the change of flag they scattered and most of them went to Chihuahua.

One of the wonders of these fields is that to-day an American has a hole on top of a hill 200 feet high and is washing out $10 a day from the boulders and dirt. Mr. Chaves also tells of a man named Anastacio Sandoval, who many years ago found a nugget in these placers worth $1600.

SOUTH DAKOTA.

RAINY LAKE REGION.—*Pioneer:* Jeff Hildreth says that the five-stamp mill at the Little American mine, of which he is manager, which is in the immediate vicinity of Rainy Lake City, has been crushing twenty tons of ore a day since it began running on July 19th. After running from the 19th to the 21st the mill was stopped, and for the two days' run twenty-eight ounces of free gold were cleaned up. Then the mill was started again and ran until the morning of Aug. 1st, cleaning up for this run of eleven days ninety-three ounces of free gold. The lower average of the last eleven days' run was due to the fact that surface ore was being worked, and ore taken from a branch of the vein which contains more than an average quantity of slate. The gold as it comes from the mill is not free from impurity, and its value is from $17 to $18 an ounce. At $17, the value of thirteen days' product of free gold from this mine is $2057, or at the rate of $128.23 per day. Aside from the free gold he has saved at least half a ton per day of concentrates, which have assayed from $250 per ton and upward. He says that the value of these concentrates, after deducting all expense of extracting the gold, is at least $200 per ton, assuming that they average only $250 per ton of gold. This would add $100 per day to the product of the mill and bring the total to over $250 per day. The expense of mining the quartz and operating the mill does not exceed $60 per day. The manager adds that he has thousands of tons of ore "in sight," and has every reason to believe that the mine will yield hundreds of thousands.

UTAH.

THE UINTAH COUNTRY.—A letter written at Fort Duchesne says:

"The mining excitement is high here. Parties are pushing in from Denver, Cheyenne, the Henry mountains and Colorado river region. The camp at Dead Man's, the center of attraction, and forty miles west of north from Fort Duchesne, is about as tough a place as they make them. Bad men and worse men from Creede, Denver, Cheyenne and Helena are there.

"They have ore which, it is said, runs from $280 to $1500 in gold. Cass Hite tells me that he is camped twenty-one miles northwest of our place. He has located some quartz claims there, but is not bothering with placers yet. His belief is that the field is a rich one. Last night he showed me a piece of rock in which I could see the gold with my naked eye. What he has is no fake, and it came from the head of the stream which washes down our gulch. I will ship you the samples we have the first opportunity. A party of Deaverites are here on their way to a point west of Dead Man's.

"I have seen a magnificent stretch of country right in the mountains and east of Lake Fork, about thirty to forty square miles in area. It is watered by a single mountain stream and four or five like streams. The soil is the richest I ever saw in Utah, and the grass and wild grain for twenty-five miles grow as high as a horse's back. People in Salt Lake have no idea of what a country this is. The mountain range and bad lands shut off the best country from ordinary travel, and unless a person travels by the Indian trails, as we did, he will not see the fine places.

"Traveling expenses are high in this region. Oats are $2 a hundred and hay $1.50 per bale."

THE BUTLER & BECK.—The Butler & Beck Mining Company owns a group of eight claims, which are developed by means of a 900-foot tunnel. Three hundred feet of stoping ground is ready for the stopers to go to work on, and enough ore can soon be taken out to run a mill for a long time. The vein averages four feet in width, half of which is pay ore, running about twenty-five ounces silver and $16 in gold per ton. The ore is free milling in character.

WYOMING.

OWEN'S MINING BOOM.—Owen correspondence Laramie *Republican:* The mining interests in these diggings are working up to what might be termed a paying basis. A few test runs have been made in the last few days, which show up well for the mine-owners. The test made on the Gold Bug shows that the gravel goes $2.40 per yard on the surface. Reports from the black sand, which is abundantly found in the gravel, show $40 per ton.

There is now a new machine on the Gold Bug, which will make a test of the ground and also of the quality of the black sand. There is also in course of construction a water wheel, which, when completed, will hoist 1750 gallons of water per minute. The wheel is what is known as the Mertz and Dodge patent.

ALASKA.

IMPROVEMENTS AT TREADWELL.—*News:* The improvements at the Treadwell works are completed. The gallows frame is eighty feet high, 18x46 in dimensions and arranged so that two skips will raise loaded cars from the shaft and dump them automatically into the crushers, capable of handling from thirty to sixty tons per hour each in the crusher-house built alongside the hoist plant, thirty-two feet from the ground. An ore bin, with a capacity of 200 tons, receives the ore from the crushers and discharges it through four chutes into cars, which are hauled to the mill bin by a locomotive. As soon as the hoist plant is completed, a three-compartment shaft will be sunk several hundred feet, and levels driven on the ore body to open the lower workings. Bricklayers are building a large brick smokestack at the chlorination works, seventy-two feet high; base, fourteen feet across; top, six and one-half feet; flue, 4½x4½. The walls are four feet thick at the base and one foot thick at the top. The stack will take 120,000 brick, shipped from San Francisco.

AUSTRALIA.

VERY WONDERFUL.—The following is a dispatch from London regarding recent alleged discoveries of gold in Western Australia: A party of six were returning from an unsuccessful prospecting tour to Coolgardie, on May 8th. When in camp one night, they separated to test and examine the neighborhood. A man named Mills came to one of the large "blows" which are characteristic of the country. He was astonished on rubbing his hands across the protruding piece of stone to see gold standing out prominently. He knocked a large piece off the boulder, and at his feet lay a magnificent specimen, literally studded with coarse gold, while before him, dazzling his eyes, was a magnificent reef of almost pure gold—a fortune in itself.

Mills, taking several pieces from the reef, placed them in his bosom, and carefully covering the reef with earth, found his mates. The next morning twenty-five acres were pegged off, and the adjoining blocks at each end were also taken up. One man went to town and bought a dolly—the largest he could procure. In one day they dollied 1000 ounces, and in a short time they had nearly $100,000 worth of ore. On June 23d they packed it in a cart and landed the treasure at the Union Bank. The manager weighed the gold, and it turned the scales at 4280 ounces. A few days after this the discovery became public.

One lump has been taken from the reef containing more gold than ore. It weighed 240 pounds and is worth $20,000. Of course, there is immense excitement in the region, and many other discoveries are reported, but there is unlikely to be anything left for late comers.

BRITISH COLUMBIA.

NAKUSP.—A movement is on foot to establish a mint.

The Nakusp Mining Company are working five men on their ground on Carihoo creek.

Work has commenced on the Nakusp & Slocan railway at Nakusp.

Over 1200 tons of ore will be shipped from Silverton, commencing next week.

The Blasdel Concentrating Belt Co.

WE are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Patent Solicitors.

220 MARKET ST., SAN FRANCISCO.

Elevator, 12 Front St.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."

SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.

First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE.....Grass Valley, Nevada County, California.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Electrical Progress.

Electricity in Mining.

Many progressive men hold that of all the forces at command in the science of mining, electricity seems to be most adaptable and more nearly fulfills most of the conditions demanded, viz.: safety, efficiency, reliability, simplicity and flexibility on the one hand; on the other, the economic necessity of a minimum of cost in application and production. Risks to life and property are very great in mining and dictates both of humanity and economy will be best subserved by the adoption of any agent which will tend to minimize these risks. The great ease of production and application in the first instance, then its great flexibility and efficiency give electricity a strong claim to consideration.

Considering the demands of a mining plant, we see power consumed in winding, outside and inside hauliug, drilling, pumping, ventilation, lighting, signaling and explosive firing. Regarding the prime source of energy for such power it may be either hydraulic or steam power. In either case electricity comes to the front. In many cases the topographical surroundings and the location of fuel and water, limit the location of a steam plant, which may have to be so far away as to be very inefficient, where the steam is to be used at the mines; with electricity we generate it at these same boilers, and placing them where they will suit the economic conditions of best service, convey the power to its work with but slight loss. These conditions very often obtain, the location of a steam plant perhaps being a matter of great mechanical difficulty in transportation and erection in the first place, and where the site of water for the boilers and the haulage of costly fuel prescribe the limits. With this agent, though, we erect our steam plant and dynamos at the most advantageous site and take the electric cable to the mines, elevation and distance no longer almost insuperable obstacles. An instance of this kind is the plant at the Virginius mine in Colorado, at the elevation of 12,000 feet. The cost of fuel there, which had to be packed up the mountain on burros, was stated to be $18 per ton, amounting in a year to some $80,000. The present source of power is Red Cauyon creek, four miles distant from the openiugs, where 300-horse power is generated and carried to the mines at a pressure of 800 volts; the saving of fuel in one year alone paid for the electric plant.

When not at work, no power is consumed in electrical apparatus, the prime generator producing just what is consumed, antomatically. At a Michigan miue, 175-horse power are trausmitted three miles hy compressed air, with an efficieucy at the mines of only 35 per cent—thus showing a 65 per cent loss in transmission. With electricity, these figures would probably be reversed. One electric compauy guaranteed an efficiency of 73 per cent, based upon au initial efficiency of 100 and successive losses of 10 per cent in dynamo conversion, 10 per cent in line trausmission, and 10 per cent in reconversion at the motor. An ordinary efficiency of compressed air is from 20 to 40 per cent, rarely 50. The cost of conductors for carrying an equal amount of power at average pressures has been stated by Prof. M. C. Ihlseng in the case of electricity steam and compressed air to be as 1 to 27 to 19.

An invaluable feature of an electrical miniug plant is its great flexibility and the great ease with which changes in the distribution of energy cau be made. It is but a few hours job to branch and take a wire to any part of the mine to a motor. With greatest ease we lead a wire around a corner, take it up or down a shaft or slope. Simplicity and completeness commend themselves at all times to the miner and nothing can be more complete than the different ways in which we can haruess electricity to various uses in this directiou.

The impediments in the way of the adoption of this agent in mining have been several. Mr. Pocock says: "Electrical engineers are not familiar with the routine of practical mine workings and are, therefore placed at a disadvantage by not knowing the actual requirements of mining eugineers and the many little difficulties to be met with in undergrouud workings; aud until mining engineers have acquired the necessary knowledge and a confidence in electricity, it is only natural that they will continue to follow the beaten path. Experimeuts in mining are costly, necessarily, and until a method or appliance can hope to complete with the older way, it has to be brought to a "hard pan" basis before it will receive the consideration due to its merits, however prononnced or enticing. While an electrical mining plant as a whole is comparatively simple, yet the details of the mechanism of the different machines, locomotives, etc., remain to be considerably simplified to withstand the inevitable hard usage to which they will be snbjected."

Electricity and the Israelites.

There is nothiug new on the face of the earth, and there is no doubt that electricity was known to the Israelites, and probably to the Phœnicians. The first record of electrical phenomena is as old as the Ten Commandments. Moses, when he received the stone tablets on which the Ten Commandments were written the second time, built a box out of fir, not the common cedar or any other native wood, which had to be imported by Phœnician merchants from the southern part of Europe. Was this choice accidental, on accouut of the great value of the resinous wood, or was it the choice of the best known non-conductor among the great varieties of timbers?

Moses had the fir box lined inside and outside with beaten gold, which converted the ark of the covenant into a very expeusive but very perfect Leyden jar or storage battery for electricity. As gold is by 50 per cent a better conductor of electricity than copper, was the choice of gold again ou account of its value, or was it an inspiration or revelation? So much is certain, that if Edison or Tesla had lived in those days they could not have improved on the choice of material, aud the result was a powerful Leyden jar.

How was this Leyden jar charged? was the next problem. A fire of material rich in carbon was kept burning on top of the ark of the covenant, aud during day time a tall column of smoke guided the twelve tribes of Israel throngh there wanderings, and at night a tall flame was equally as well seen by them. Now carbon is a good conductor of electricity, and the particles of carbon floating in the smoke would conduct sufficient electricity to highly charge the Leyden jar. At least the current of electricity would be amply strong, so that if a hand were held toward the ark of the covenant sparks would result. That this was done hy Moses at different times is a matter of record, and that he could always depend that his faithful Levites would obey his instructions to the letter, and have the jar always charged.

After Moses' death Aaron, his brother, took the matter in hand and greatly improved the electrical power of the strange battery. He had the ark of the covenant placed in the temple, he had it surrounded by poles 50 ells high, or 150 feet. These poles were covered with beaten gold and gold chains were hung from poles to the ark of the covenant which made a very expensive but very complete and powerful electrical connection. In a conntry where electrical storms are as frequent and as powerful as in Palestine at an elevation of 600 feet and a reach of 150 feet of the best conductor, an abundant supply of Frankliu's electricity would necessarily always be on hand.

It is very likely that Aaron kuew nothing of amperes, ohms or volts, otherwise his two sons never would have monkeyed with this powerful apparatus, and they would not have been killed by fire breaking out of the ark of the coveuant and killing them without any wounds or burns appearing on their body.

Any coroner's jury of to-day, if it were to sit on an inquest over the body of Aaron's sons, would at once bring a verdict of death by a discharge of electricity.

Aaron knew this power, aud to make it effective, all he had to do to deal death from this apparatus was to remove the costly camel's hair carpets, which are almost perfect non-conductors of electricity, aud make the culprit stand on terra firma; death would result instantly by fire breaking out and leave no wounds or burns to account for his death. That several members of revolting tribes of Israelites were thus electrocuted is also a matter of record in the Bible.

Solomon in building his temple advanced one step further; he found that copper would do as well as gold. He had the temple covered with copper, and copper waterpipes led into the cisterns inside the temple. On the temple, or rather on its roof, a number of gilt spears were placed in vertical positions, ostensibly to scare off the birds, and to keep them from defiling the temple, but these spears were several cords high, or from 16 to 24 feet. Such a height would hardly he necessary for scarecrows, but it was ample to load the roof, waterpipes, etc., with a powerful current of electricity.

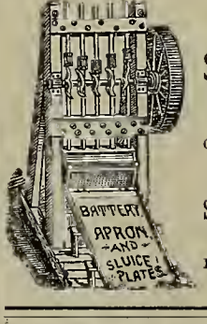
Franklin, the electric chair in the State of New York, as well as the discovery of the Leyden jar itself in Leyden, Germany, are all back numbers. History repeats itself, whether recorded or not.—Savannah Morning News.

Substitue for the Trolley.

In order to take off the current from an overhead wire for an electric car the latter is usually equipped with a grooved metallic wheel, which is pressed upward against the wire by springs actuating a pole rising from the top of the car. At curves aud crossings this device, the "trolley" that gives its uame to the whole system, sometimes becomes displaced, aud some time is required to get it into positiou again. Meantime the car is at a standstill, perhaps blocking the way of other cars, and at night losing its lights also, if it happens to depend on electricity for illumination. Hence the need of some improvemeut ou the plan now extensively pursued in this country. Recently has been introduced, as a substitute for the trolley wheel, an oblong metal frame, supported in substantially the same manner. Two such frames are placed on each car, probably to "make assurance doubly sure." This arrangement is free to slide from side to side at curves, yet will continue to maiutain an electrical connectiou. In this respect the invention is douhtless a success; though it would seem the frame would get entangled in the cross-wires which support the overhead wires.

The "Loud" Speaking Telephone.

A loud speakiug telephone was recently described in the English electrical papers, for which the claim was made that it would "revolutionize our present system of working," as the message over it was spoken with such force as to be heard all over a large room. Another firm now lays claim to the discovery and prior operation of the "loud speaker." There is a certain trick in the use of excessive battery, usually a storage battery, in connection with a low resistance, granulated carbon transmitter, which may possibly account for both of these "discoveries." Any good long distance transmitter can be made to speak out so that it can be heard all over the room by the use of this subterfuge. A very loud effect cau be secured by the use of what is known as a telephone repeater, which has the same relation to the telephone as the relay has to the telegraph sounder. The repeater has so far not been commercial, for the reason that no successful circuit has yet been inveuted which would enable it to work more than one way. A most important invention, if it ever does appear, will be a telephone repeater which will work both ways over au ordinary metallic circuit. In cases where the transmitter is forced hy the use of excessive battery, which is sometimes doue for the benefit—or otherwise—of prospective subscribers of stock, while the results in loud speaking are astounding, such forcing is injurious to the transmitter and shortens its life, in fact it is frequently burned up by the heavy current which it is called upon to sustain. The public may be interested to know that in more than oue public exhibition of loud speaking telephones the transmitters at the other end of the line have been so forced by strong storage batteries as to make it necessary to employ half a dozen or so transmitters. The strain of the current was so severe that the trausmitters became too hot to use, and one was kept in operation while the other five were cooling off. This is one of the tricks of the trade which is not without significance in the preseut "loud-speaking" contention.



To Gold Miners!

Silver Plated Copper Amalgam Plates

For Saving Gold.

GOLD REMOVED FROM OLD PLATES AND REPLATED. Old Plates bought. Get our Reduced Rates. Five thousand orders filled. Twenty-five Medals Awarded.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Practical Information.

A Vast Army.

About $1,400,000,000 went into the treasuries of the 1890 railroad corporations in the United States during the year which ended June 30, 1893, most of it being derived from carrying 503,560,612 passengers 14,229,101,084 miles and 745,119,482 tons of freight 92,588,111,833 miles on 176,461 miles of railroad.

The statistics of the Interstate Commerce Commission, just issued at Washington, are interesting when they tell of the legions of men whose existence depends on the prosperity of the vast adjuncts to commerce and civilization.

These 1890 railroad companies were the mainstay of 873,662 employes of all grades, so that one person in every 90 of the population depends for a livelihood on a railroad company. To equip the "plant," without which not one employe could earn a day's pay, the capitalists invested $10,500,000,000 and received $100,929,855 in dividends, less than one per cent, although the gross earnings were $1,220,751,874. The operating expenses were $827,921,299, so that, on a rough calculation, out of every dollar received by the companies 75 cents went into the pockets of employes.

To carry all these passeugers and move the freight required 34,788 locomotives, of which 8957 were for passenger trains and 4802 for switching. The road engines drew 31,384 passenger cars and 1,047,577 freight cars.

This transportation service gave a living to nearly 400,000 men. The superintending, clerical work and other avocations of the higher employes gave incomes to 35,384 persons; 256,212 were employed on the ways and structures, and 175,464 mechanics and others were paid to look after the rolling stock and other equipment.

It is worthy of note that the armies of men employed incidentally in industries which are germane to railroading and on which such service depends are not factors in these statisties.

Interesting data are found on analyzing these figures. For instance, it is found that each locomotive on the passenger service drew in the year, on the average, 66,268 passengers and traveled 1,588,601 passenger miles. Each freight locomotive drew in the year 40,062 tons 5,031,889 ton miles.

The number of passenger cars to each milliou passengers was 53, and the number of freight cars to every million tons of freight was 1613. The average journey of each passeuger was nearly 24 miles, aud the average haul per ton was a little more than 125 miles. Passenger train mileage was 335,618,770 aud freight train mileage was 508,719,506. The passenger service brought in 29.49 per cent of the income and the freight service 68.23 per cent. Each 100 miles of railroad in the United States was the source whence 515 men obtained money to live.

If second tracks, yard tracks and sidings are taken into consideration there are more than 230,137 miles of lines in the country, of which 10,051 miles are second track. The increase of milcage in 1892–93 was nearly 4900 miles, an increase over 1891–92 of 1900 miles. The greatest increase was in the State of Washington, 556.32 miles; in Montana, 409.66; in Minnesota, 406.69 miles and in West Virginia, 365 miles.

Forty-two companies in the United States have a mileage of over 1000 miles and 26 have a mileage of between 600 and 1000. Companies having a mileage of 250 or less number 902. The 42 big companies controlled 98,385.54 miles of line, leaving 1848 companies controlling but 44.22 of the total active railroad mileage.

The accident statistics show 2727 employes killed, 31,729 injured, and 299 passengers killed, 3229 injured. One employe was killed to every 320 men employed, and one was injured while 27 escaped. Trainmen fared the worst, as ten per cent of them were injured in various ways. As to passengers one out of nearly 2,000,000 was killed, and one out of 183,822 injured, or one killed for each 47,588,966 passeuger miles run, and one injured for each 4,406,659 passenger miles run.

Makes Himself Generally Useful.

Si Warman thus describes the work of a fireman on a New York Central fast passenger train: At least every thirty seconds he throws open the furnace door, and without a false motion or the slightest delay hurls exactly three shovelfuls of coal on the fire. He knows just how to spill and spread it with a dexterous turn of the wrist. Before Albany is reached he must throw 6375 pounds of that coal into the fire, or nearly 40 pounds a minute, or an average of 44 pounds a mile. Then, too, he must know exactly where he is along the road, and when to drop his shovel and seize the bell-cord. He must know the proper iustant to vault into his seat when important curves are reached to watch for signals. He must see that the steam doesn't vary, and he is proud to shout in your ear when near Albany: "She hasn't varied three pounds since we left New York." He must watch the water gauge of the boiler and is constantly kept changing the pumps and seeiug that they do their work properly. All the time he must keep throwiug in his 44 pounds of coal on the fire every mile. It isu't long before he surprises you with another motion. He throws open the furnace and thrusts a long, double-pronged fork into the fire. With a twist he prods the glowing mass, and when he pulls his fork out its teeth are eherry red. Then comes the whir of the shovel again and the sound of the hammer as Tompkins breaks up the large lumps of coal. Wheu you approach Montrose, near Peekskill, the eugineer begins to slow down. If you look ahead you will see a uarrow trough between the rails filled with water. The engine is going to take on water at a flying leap. Tompkins stands at the side of the tender with his hands on a lever. Engineer Foyle suddenly startles you with a shrill whistle between his teeth that would put to shame the warning signal a New York newsboy gives to his gambling mates when a policeman comes in sight. Instantly the lever flies back, and as you look at the wheels of the teuder you see surging up among the trucks a torrent of water. It splashes and roars, and as you wonder if you wouldn't be carried away, two whistles from Foyle, sharper and shriller than the first, warn Tompkins to pull up the scoop and that the end of the water trough is near. Then Tompkins goes back to his coal, his pump, his pipe, water gauge, his bell, his watch for signals, aud you wonder what new work he will do next. Before you are aware of it, he touches you upon the knee and motions you to raise your feet while he turns on a hose aud wets the floor of the eab to keep down the dust, after which he sweeps up with a stubby broom. Next he is shaking the grates with a big steel lever that looks like the tiller of a large sail boat. You now begin to take in what it means to be a fireman. Toward the end of the trip you taphis shoulder and shout to him: "This seems to keep you pretty busy." "I tell you there is uo funny business about this work," is his response.

THE *Engineering Magazine* says that the flesh side of leather is the best to place against the pulley when such leather is used as a belt, notwithstanding this to be contrary to the most usual practice; but this general practice is due to the ideas of belt-makers rather than to those of belt users. Traction, he says, is greater where the surface is elastic and has a clinging tendency than where it is hard and smooth. This is because this kind of surface clutches the pulley more securely by being pressed into all the pores and interstices of the metal or varnish. If a smooth, hard belt were desirable, theu of course a thiu metal band would be the best thing.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 16, 1894.

Silver shows a slight advance during the week. There is an increased demand for Mexican dollars. New York lead quotations continue $3.10, but it would he difficult to buy there at that price; $3.50 would be nearer the selling price. Now that the tariff hill has finally passed hoth houses, it is asserted the pri e of lead will he less a question of desire on the part of the trust.

The coal trade is dull; there is a full supply aud light demand. The new tariff hill reduces the duty from 75 to 40 cents per ton. If consumers can get the benefit the result will be locally satisfactory. Quicksilver continues quotable at $36. The July receipts were 1536 flasks; the receipts for the first seven months of '94, 15,293 flasks.

The total exports of tin plate from Great Britain to this country during the past five years are as follows, in tons of 2240 pounds: 1894, first seven months, 118,099; 1893, 255,583; 1892, 276,479; 1891, 325,145; 1890, 318.108.

The following is a Treasury statement of the average ad valorem rates of duty of the McKinley law and the new hill on a number of items. Wherever the duties are specific in either hill they are reduced to ad valorem rates for purposes of comparison:

	McKinley.	New hill.

Mining Share Market.

SAN FRANCISCO, August 16, 1894.

There was a general advance in prices during the week, and nearly all the listed stocks were in good demand. Work has been resumed in the Yellow Jacket, and is to he on the 1700 level of the Con. Cal. & Va. Low water in the Carson river has caused the Mexican mill to shut down. The California Mining Company had a cash halance of $69,237 on the 1st, after paying all July expenses.

The following illustrates the changes of the week:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 7, 1894.

524,128.—FURNACE—G. E. Belmor, S. F.

523,967.—BOTTLE STOPPER—M. L. Bergman, Spokane, Wash.

524,084.—NUTLOCK KEY—J. C. Brown, Santa Barbara, Cal.

524,243.—RAISING VESSELS—O. A. Bulette, Charleston, Wash.

524,163.—PACKING BOXES—J. V. Coleman, S. F.

523,974.—CLAMP—A. J. Courtney, Pine Ridge, Cal.

523,976.—NUTLOCK—P. W. Dillon, Davenport, Wash.

523,979.—CARTRIDGE—M. H. Durst, Wheatland, Cal.

523,983.—FOLDING BED—S. Hawver, University, Cal.

524,171.—ROWLOCK—J. T. Ish, S. F.

524,147.—BUTTER MOLD—H. S. Maltby, Clarksville, Cal.

524,297.—GAME—R. J. Rolfson, S. F.

524,293.—RAILWAY RAIL JOINT—L. H. Woolley, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ADJUSTABLE BUTTER MOLD.—Herbert Sanford Malthy of Clarksville, California. No. 524,147. Dated Aug. 7, 1894. The invention in this mold lies in adjustahly connecting its sections, in order to regulate its capacity to any required weight. In hutter molding it is necessary to compensate for difference in weight, dependent upon changes in temperature and upou the swelling of the mold. The dairyman has often to buy new molds and undertake the difficult operation of cutting them to proper size, in order to fill orders for given weights of rolls; and even this is an imperfect expedient, as a change in temperature or the swelling of the mold will disarrange his calculation. By the use of this mold the dairyman can, hy means of its adjustahly connected sections, accurately compensate for the changes due to temperature and swelling.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors bave only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ahlest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliahle.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Gco. H. Strong), tbis agency has the hest knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

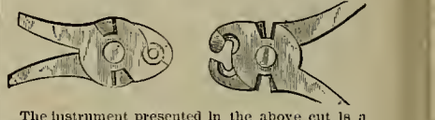
Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many tbousands, to whom we refer with confidence, as men of influence and reliahility. Old and new inventors are cordially offered tbe complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors balf the advantages possessed by this old, well-tried and experienced firm.

The Deepest Hole in the Ground.

The deepest borehole of the earth is the oue at Poroschowitz, in the Rybuik district, Upper Silesia. It has been carried to a depth of something beyond 2000 meters (about 6700 feet) and the diameter of the tube at the bottom is seven ceutimeters. Boring to such depth and moreover through solid rock was almost impossible prior to the invention of the Mannesmann tube; the greater strength of this tube, as compared with others, makes it possible to use tubes of thinner gauge.[1] It is expected that a final depth of yet another 500 meters (some 1670 feet) can be reached, and a number of interesting observations on temperature, etc., will be made.—Loudon Engineering.

GIANT POWDER FURE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

MOODEY & SHERWOOD, Fresno, Cal.

G. W. PENNINGTON & SONS' STEEL WORKS.

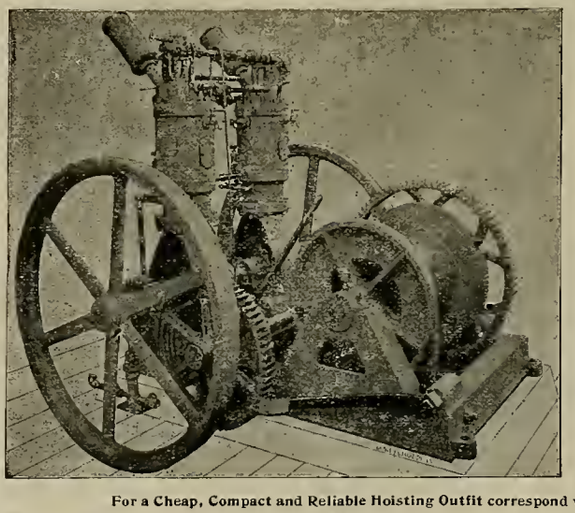
Manufacturers of

Best Refined Cast Tool Steel.

Machinery and Hammer Steel, Steel Piston Rods, Steamboat Shafts, Dredger Buckets, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.

Office and Works:

218-220 Folsom St., - - - San Francisco, Cal.



The Golden Gate Gas Engine

is not a new comer, but has not been advertised in the papers as some others. If you are in need of a Gas Engine, just ask anyone whoever has anything to do with them, and they will tell you:

Get the Golden Gate.

USES GAS or GASOLINE.

For a Cheap, Compact and Reliable Hoisting Outfit correspond with

Adam Schilling & Sons,

211-213 MAIN St., San Francisco,

The "GOLDEN GATE" is made strictly according to its own Letters Patent Issued.

MINING SHAREHOLDERS' DIRECTORY.

Independence M Co, Nev	Annual	J W Pew, 310 Pine	Aug 20

Coast Industrial Notes.

—Oregon's wool clip this year is estimated at 18,000,000 pounds.

—Placer county has voted $80,000 bonds for building its new courthouse.

—The city of Vallejo wants to be lit by electricity and invites proposals therefor.

—The Seattle Consolidated Railway Company has run behind over $25,000 in the last six months.

Lynd & Hough have built a gasoline schooner at California City for their northwestern codfish trade.

—The timber belt of Humboldt and Mendocino counties embraces 4125 square miles, containing 132,000,000,000 feet of timber.

The Interstate Fair opened at Tacoma, Washington, on last Wednesday. Montana, Idaho, Oregon, Washington, the Province of British Columbia and the Territory of Alaska are the exhibitors.

The California Wine Association has filed articles of incorporation; capital stock $10,000,000, of which $2,600,000 has been subscribed for by the following firms: Arpad Haraszthy & Co., $300,000; C. Carpy & Co., $300,000; Kohler & Van Bergen, $400,000; Kohler & Frohling, $300,000; Napa Valley Wine Co., $400,000; H. Lachman & Co., $500,000; B. Dreyfus & Co., $400,000.

—The river and harbor appropriation bill, which has been agreed to in both Houses, provides for a new project—a boat railroad to overcome the obstructions at The Dalles, on the Columbia river in Oregon and Washington. The project contemplates a hydraulic lift to raise steamboats out of the water, placing them upon a tramway car running upon eight or more tracks, transporting them thirteen miles and returning them to the water. The estimated cost is $2,000,000.

—At a recent meeting of the California Electric Light Company, it was decided to call in its stock in exchange for stock in the Edison Light and Power Co. The former owns 10,750 shares in the latter company. The Edison Co.'s incorporated capital is $3,000,000; 10,000 of its 20,000 shares have hitherto been unissued. In exchange, holders of Cal. Elect. Light Co.'s stock get one share for 4.65 shares of their stock and a 40 cent per share dividend. They also get last Wednesday's 66⅔ cents per share dividend declared by the Edison Light and Power Co.

NOTICE OF ASSESSMENT.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, Cal.; location of works, Virginia, Storey county, Nev.

Notice is hereby given that at a meeting of the board of directors, held on the 24th day of July, 1894, an assessment, No. 74, of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, room 60, Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 20th day of August, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 21st day of September, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the board of directors.

ALFRED K. DURROW, Secretary.

Office—Room 60, Nevada block, 309 Montgomery street, San Francisco, Cal.

No. 6.

FRASER & CHALMERS, CHICAGO, ILL., U. S. A.

BRANCH OFFICES:

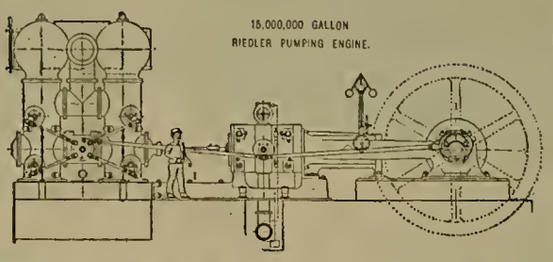
2 Wall St., New York; City of Mexico, Mexico; Salt Lake City, Utah; Helena, Montana; 527 17th St., opposite Denver Club, Denver, Colo.

We have in preparation an interesting pamphlet giving numerous cuts and descriptions of RIEDLER Pumping Engines and Air Compressors in America and Europe.

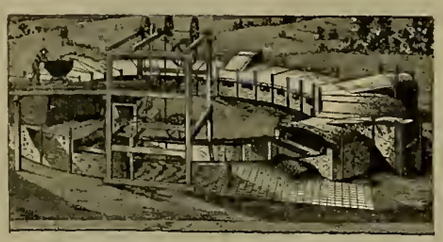
Let us book your address to receive this on publication.

Metallurgists are invited to send for our pamphlet explaining the great merits and economy in use of the

Horace F. Brown Horseshoe Roasting Furnace.



15,000,000 GALLON RIEDLER PUMPING ENGINE.



Crushers, Hoists,
Pumping Engines, Corliss Engines,
Boilers, Mechanical Stokers,
Lead Smelters, Pyritic Smelters,
Gold Mills, Silver Mills,
Mill and Mine Supplies.

WATCH FOR NEXT WEEK'S AD.

CASCADE WATER WHEEL

EMBODYING IN PRINCIPLE, THE
HURDY-GURDY or IMPULSE WHEEL.
ADAPTED TO ALL HEADS,
FROM 30 FEET TO 2000 FEET.

Our experience of **33 YEARS** in the water wheel business enables us to suit every requirement of Water Power Plants. Send for Illustrated Pamphlet.

JAMES LEFFEL & CO. SPRINGFIELD, OHIO, U. S. A. OR NEW YORK CITY.

Gold Quartz Mine For Sale.

A Good Quartz Mine, near Scott Bar, Siskiyou county, is offered for sale. Parties wishing to invest in quartz-mining property will do well to examine this ledge, from the extension of which ten-dollar rock is now being crushed. The average width of the ledge is two feet. For further information, call on or address W. A. CHAMBERLAIN, Yreka, California.

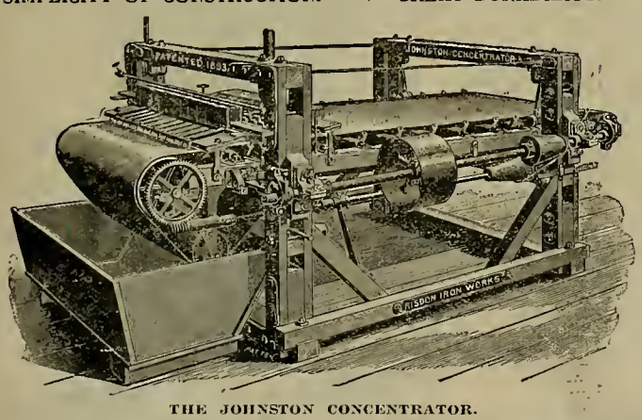
DEWEY & CO., PATENT SOLICITORS.

220 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

The Johnston Concentrator.

SIMPLICITY OF CONSTRUCTION. ✦✦ GREAT DURABILITY. ✦✦ EASE OF OPERATION. ✦✦ INCREASED PERCENTAGE OF SULPHURETS SAVED.



THE JOHNSTON CONCENTRATOR.

THE HUDSON GOLD MINING CO., WARD, COLORADO, June 8, 1894.

RISDON IRON WORKS, San Francisco—GENTLEMEN:—After a thorough test of the Johnston Concentrator, I am so well satisfied that I wired you to ship me two more as speedily as possible. I find the machine well constructed, easily kept in order, requiring but little attention, and doing entirely satisfactory work on our ore. After my experience with other tables, I am congratulating myself on my possession of the Johnston. Yours faithfully,

B. LANGRIDGE, Ph. D., Mining Engineer.

(COPY.) SAN FRANCISCO, CAL., June 1, 1894.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco:

GENTLEMEN:—We have tested the Johnston Concentrator furnished us by you on trial; and after an exhaustive test, we are satisfied it is the best in the market. Please prepare and ship us, as soon as possible, THIRTEEN more machines. Yours truly, APOLLO CONS. MINING CO.

MINING AND SCIENTIFIC PRESS.

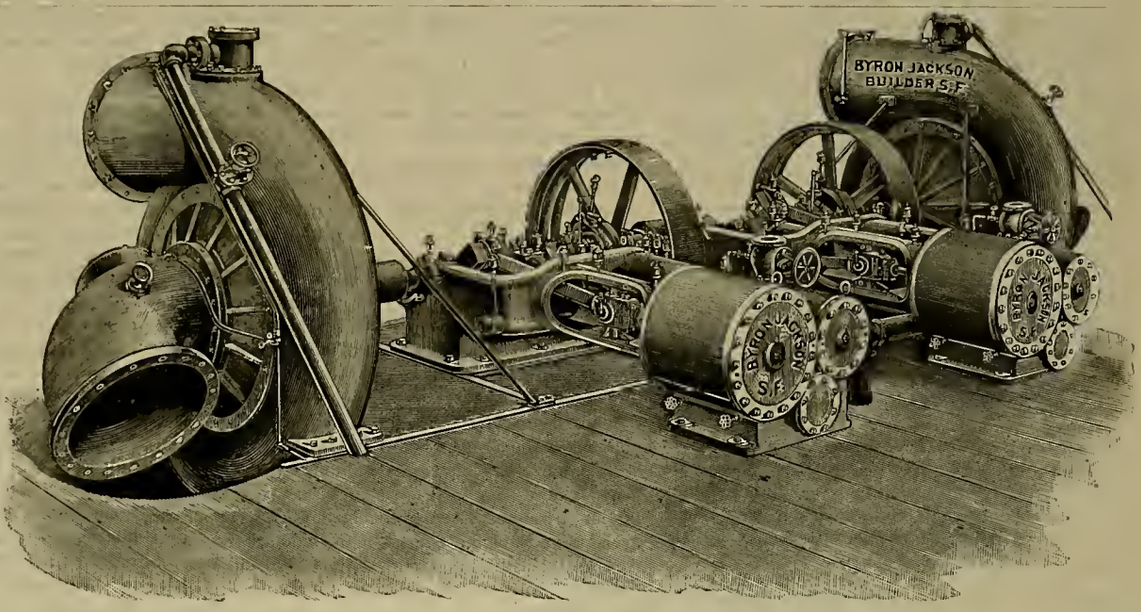
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 8. SAN FRANCISCO, SATURDAY, AUGUST 25, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Portable Electric Hoists.

The style of hoist illustrated below is mounted on wheels for moving about on temporary work, though it is equally well adapted for permanent use. It is compact, yet access to all parts needing adjustment or attention is easy. These hoists are convenient for use in tunnels for winze work or for prospecting purposes at a distance from the central station. At one end the drum is fitted with and actuated by a powerful wood-lined friction band clutch brought into play by a hand lever which is convenient to the operator. At the other end of the drum is fitted a band brake very similar to the clutch band and operated by a powerful foot lever. By means of this lever the load can be lowered at any desired speed or quickly brought to rest.

The motor is an adaptation of the railway type, with its frame so arranged as to be a part of the bed plate of the hoist. The rheostat and controller for regulating the speed of the hoist are operated by means of a lever. The pinion on the motor shaft and the intermediate gear engaging it have machine-cut teeth and are entirely inclosed in a case which will hold grease, thus reducing the noise, furnishing ample lubrication and protecting the gears from dirt and injury. The insulation of all the electrical parts is good. All parts carrying current are specially insulated and heavily waterproofed, and where possible completely encased.



DUPLICATE PUMPING PLANT.

Duplicate Pumping Plant.

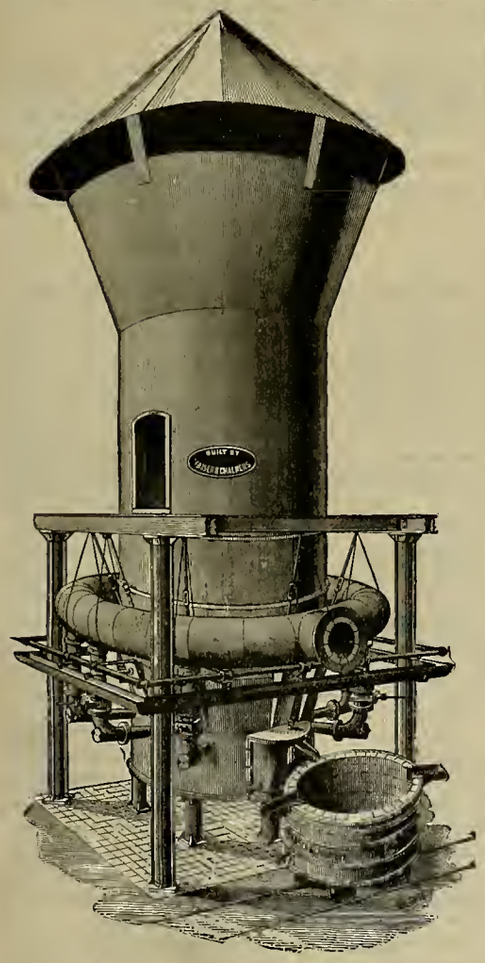
The upper illustration on this page is of a duplicate pumping plant, 200 to 300 H. P. Capacity, 45,000 to 60,000 gallons per minute; maximum lift, twenty feet. Either engine can be connected to one or both pumps. View made before shipment of plant; erected on Merritt island, Sacramento river, for Swamp Land District No. 150.

THE Central copper mine which closed last week in Keweenaw county, Michigan, after a continuous operation of forty years, returned to its stockholders $2,000,000 in dividends on an investment of $100,000.

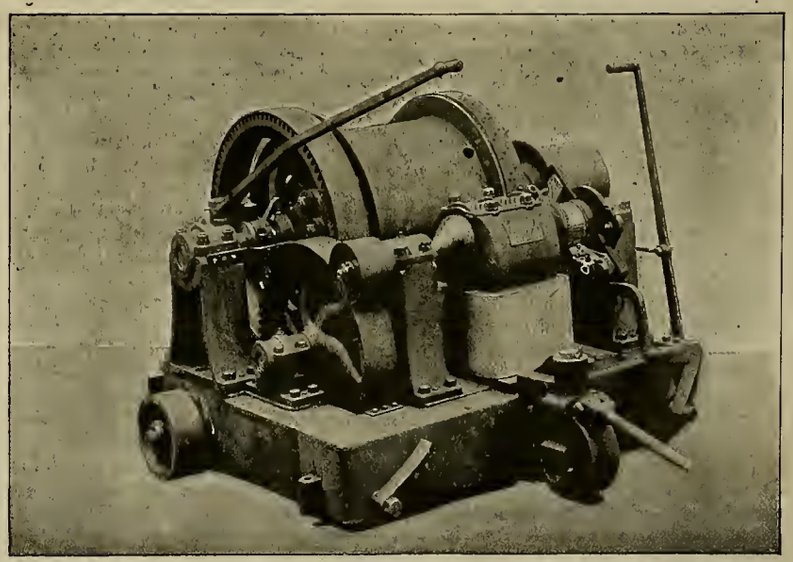
INCREASED activity in hydraulic mining is reported from the Klamath river valley, which is unaffected by anti-debris legislation. Considerable foreign capital has recently found investment there.

The Austin Pyritic Smelter.

Herewith is given an illustration of the pyritic smelter, recently put on the market by Fraser & Chalmers. Briefly stated the idea put into practice in the apparatus is to treat sulphide ores by means of heat produced from the iron and sulphur contained therein, thus avoiding the use of carbonaceous fuel, the roasting of the ores, etc. It is claimed that there is great additional advantage in the increased capacity of furnaces, exceeding that of ordinary copper smelters of like dimensions fifty per cent. Time is also reported saved in the new process. The fusibility of sulphides of iron is an important element, melting before the air blast, and by the intense heat developed fusing the ore above. A full description of the process was recently published in these columns, and no further present mention is necessary beyond reference to the general appearance of the new smelter.



THE AUSTIN PYRITIC SMELTER.



PORTABLE ELECTRIC HOIST—BAND CLUTCH TYPE.

TABLE OF CONTENTS.

ILLUSTRATIONS—Duplicate Pumping Plant; The Austin Pyritic Smelter; Portable Electric Hoist—Band Clutch Type, 113. Diagram Showing Surface Boundaries, Underground Workings, Etc., in the Con. Wyoming and Champion Mines, 116-117. Plan and Vertical Section of Shaft; From a Photograph of Incline Shaft, Standley Consolidated Mine, 118. Diagram Illustrating the Walrath vs. Champion Contention, 119.

EDITORIALS—Portable Electric Hoists; The Austin Pyritic Smelter; Duplicate Pumping Plant, 113. Pending Legislation; The "Knot" and the Mile; Received an Award; Two Recent Decisions; Bond Shipments; Miscellaneous, 114.

SCIENTIFIC PROGRESS.—Testing the Dryness of Steam; How Gas Companies Work the Public; An Improved Alloy; Miscellaneous, 124.

MISCELLANEOUS.—Personal; Concentrates, 115. A Sophist; Unemployed Labor; A Colorado Gold Mine, 118. A. Walrath et al. vs. Champion Mining Co., 119. Coast Industrial Notes; Patents, 126. The Con. Wyoming-Champion Decision, 116-117. The Origin of the Gold of Quartz Veins, 120. A Vast Copper Mine; The Big Bassick Mine, 121. Rich Mining Belt; The Production of Lead, 125.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 122-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 126.

THE Canadian Pacific Railway Co. is reported intending to use electricity for motive power on its mountain division.

THE Grass Valley *Telegraph* says: "There are idle miners enough around here to run a dozen more mines." Probably that has something to do with the present attempt to reduce the wages of the North Star and Empire employes.

RECENTLY a Californian with mining property to dispose of, sent a modestly worded advertisement to the MINING AND SCIENTIFIC PRESS for insertion for one month. After the second insertion he writes that the advertisement has sold his mine.

A RICH GOLD STRIKE is reported in Anderoy valley, about forty miles northeast of Fresno, Cal. Considerable placer gold was obtained in that vicinity many years ago. The discovery has stimulated activity in that section, there being many undeveloped quartz claims in the vicinity.

FROM St. Louis, Mo., comes a statement that a local genius "has succeeded in so concentrating the electric light that it will illumine the brain." As the new tariff law goes into effect next Monday, it would seem that the praiseworthy efforts of the St. Louis man are too tardy to be effective in the case of present Congressmen.

A TRANSFER is announced which may have considerable influence on electrical operations. The Wenstrom Electrical Company of Baltimore, with a capital stock of $1,000,000, has sold out to the Fort Wayne Electric Company of Fort Wayne, Ind., thus putting that company in control of certain patents which are reported to have been infringed by other electric manufacturers. The Fort Wayne Company, it is said, will demand an accounting from all who are reported as having infringed upon its patents.

THE monetary feature of the week has been the advance of nearly four cents an ounce in the price of silver. It is believed that while the Chinese war is the present cause of the notable advance, yet remote and underlying causes will insure a steady advance in price toward its old-time ratio. The continued depression in the price of the white metal has occasioned so general a cessation of silver mining, that it will be some time before even a prolonged hardening of the market will induce general resumption of work on the part of many who have turned their attention to the development of gold properties. The industrial effect will, however, be most gratifying, for however specious the theories of the monometallist, the fact is evident that the country cannot recover its business elasticity till silver approximates the position it so long held in the business world.

Pending Legislation.

It was Gen. Hancock who said: "The tariff is a local issue," and although that remark contributed as much as anything else to his defeat yet there was considerable truth in the assertion. Other things than the tariff partake of the nature of "a local issue," among them, mining legislation. When the recent suspension of assessment bill was pending it was warmly endorsed by some sections and strenuously opposed by others. The territory affected by the laws of Congress is so extensive and diversified that it is the rule rather than the exception to have the same measures viewed very differently by people whose interests are not identical, locally. The bill now before the Senate, having passed the House, is a case in point.

On February 17th, '94, a bill was introduced by Congressman Newlands of Nevada, at the request of the California Miners' Association, amending the Revised Statutes, California having no representative in the House Committee on Mines and Mining, to which committee it was referred. The amendments proposed in chapter 6, title 32 of the Revised Statutes, while prejudicial to no mining interest, were calculated to be of direct benefit to all, as heretofore shown in these columns. One clause in particular says: "* * * * And provided further, that whenever land is proven to be a well-defined mineral belt, such land shall be deemed, presumed and taken to be, and always to have been, mineral land, unless the contrary is proven," etc. That "always to have been" seems to have been successfully objected to, so far as the House is concerned; for, in a bill favorably recommended by the House Committee on Mines and Mining, and which is now pending in the Senate, being before the Public Land Committee, that clause is eliminated. It is manifestly a necessary provision to preserve intact, so far as possible, the encroachments of corporate greed upon the mineral area of this and other States. At the October '93 meeting of the California Miners' Association in this city this was fully and clearly demonstrated.

The MINING AND SCIENTIFIC PRESS is able to partially explain some of the action that resulted in the passage by the House of the bill in its present shape. When introducing the bill now under discussion, Congressman Caminetti explained that the object was to define the rules of evidence in regard to mineral and other kinds of land; there was no attempt to injure or interfere with anybody or anybody's rights, but simply a desire to equalize and make possible a greater measure of justice than existed or exists.

The bill was subjected to very close scrutiny before the Committee on Mines and Mining, and Rawlins of Utah, who is a member of the committee, moved to strike out the clause providing that any land within a well-defined mineral belt should be presumed to be mineral land. It seems that at Eureka, Utah, there is a contest between the owners of the townsite and applicants for mineral patents to some of the included ground, and the townsite owners got delegate Rawlins to argue that "a mineral belt is indefinable." The clause was stricken out, but Congressman Caminetti was successful in getting it restored, with a proviso exempting Utah from its provisions. Then Congressman Pickler, of South Dakota, had an amendment added providing that none of the enactment should be applicable to contests pending. Others whose names are not reported got in further "fine work" with the bill, which in its present condition needs some prompt and effective action on the part of those interested in seeing that California mining interests receive the same full consideration that has been awarded the representatives of other sections.

THE British South Africa Company has issued a set of official regulations which make curious reading to an American. Before one can do any prospecting, he must sign an agreement to obey all the laws of the company and fight, if necessary, for the maintenance of law and order. That costs a shilling. The license then issued permits him to "peg off" one placer claim (called "alluvial" claim in South Africa) and ten quartz "reef" claims, a certificate for that costing sixty cents. The placer claim is limited to 150 feet square, the quartz ledges 150 feet along the ledge and 200 feet each side. He can follow the ledge in all its dips, spurs, angles and sinuosities. Within four months he must sink a shaft at least thirty feet in the ledge or alongside crosscutting it, the company owning half the claim without sharing any of the expense, and its consent being necessary before the miner can transfer his half. In a placer claim $5 per month must be paid. The miner has neither voice nor vote in any public transaction.

The "Knot" and the Mile.

An inland reader writes regarding the term "knot," in an editorial in last week's issue about the battleship Oregon, and says that he understands a "knot" to be 6082 feet in length, a statute mile being 5280 feet, and that if the battleship Oregon attains a speed of seventeen knots that would be 19.6 miles. The statement is correct, excepting the inexact use of the term "knot." As this misuse is common, a word regarding it may be in place. As a matter of fact there is no such distance as a "knot." We have miles, leagues, etc., which are regularly defined distances, but a "knot" can correctly be used only in determining the rate of speed at which a vessel moves in the water. The confusion partly arises in the relation or proportion between a nautical mile and a statute mile. True, it may be argued that the distance between two knots on the logline is 6082 feet, and hence a "knot" is 6082 feet, but that is a confounding of terms. In this regard the distance may be thus stated. A mile is a mile, regardless of time, while a "knot" is always correctly spoken of in connection with time.

Received an Award.

The following, coming from the source it does, is appreciated. It is a copy of an official communication received last Wednesday from the Executive Committee on Awards of the World's Columbian Exhibition last year at Chicago. Seldom has a journal received a higher compliment from a more distinguished source, and though the MINING AND SCIENTIFIC PRESS rarely reprints the many appreciative notices it receives, (though they are none the less highly appreciated), it gives place to the following:

UNITED STATES.

DEPARTMENT E.—MINES AND MINING. 22,708
Group 67. Class 411.

Exhibit—THE MINING AND SCIENTIFIC PRESS.

AWARD.

The general reliability of its news, and the clear and intelligent editorials therein. It consists of several numbers of the journal named. This journal is favorably known for the fullness and accuracy of its weekly reports of the progress of mining on the Pacific coast.

(Signed) WM. C. DAY, Individual Judge.

Approved: H. M. HOWE,
President Departmental Committee.

Approved: JOHN BOYD THATCHER,
Chairman Executive Committee on Awards.

Two Recent Decisions.

Elsewhere appears the full text of the decisions in two cases which attract considerable attention in the mining world. It is felt that their importance justifies their publication in full, as they will be needed in convenient form for reference. The maps accompanying have been engraved especially to accompany the text of the decisions for fuller understanding of the subject. It would have been our further pleasure to have illustrated the admirable model prepared by W. F. Englebright, M. E., of Nevada City, Cal., which did so much to elucidate the subject when argued before the Court, but after two attempts it was found that no illustration could do justice to the ingenious original. The model elicited universal commendation, and reflects credit on its contriver, being a complete exhibit of the workings in dispute.

Bond Shipments.

Up to the present time as regards foreign lead ores, Mexico has had an advantage over British Columbia. The Omaha & Grant smelter at Omaha is a bonded warehouse, and under that arrangement Mexican lead ore has been shipped across the line in bond, refined into bullion and exported without paying one cent of duty. Recently on one shipment from Mexican mines to Omaha the customs duties would have been $40,000 were the same rule applied as is to British Columbia ore. Without the advantage mentioned, the Omaha smelter would have had to pay

the $40,000, be out the use of it for ninety days, subsequently getting it back in rebate minus one per cent government charges. The British Columbia mines haven't that special arrangement of shipping direct in bond and reshipping the product without temporary tariff payments.

A PHILADELPHIA contemporary, commenting on the list of July mining dividends in this paper, speaks in a way that justifies the inference of its belief that that list represents all the mining dividends of the country. Not a hundredth part of them. It is simply an approximately correct list of dividends declared by large incorporated companies, many of whom advertise their dividends and all of whom give publicity for business reasons to the fact that such dividend was declared. But for every mine listed or incorporated there is a hundred regarding which no proclamation is made of the dividends or profit, chiefly owned by private individuals who do not care to announce their gains. They are working the mine for all that is in it, *i. e.*, in the mine, and what they make is not a subject of public knowledge. There are many gold mines in this State, for instance, paying enormously, some as high as $100,000 a month, and many more paying from $1000 a month up to $10,000, that are not making much noise about it. Yet it is these mines that make up the bulk of the aggregate of California's annual gold yield, and it is these mines that make up in a great measure the prosperity of the mining regions. The money goes out to the men at work, the merchants, the dealers in supplies, etc., the profits are expended in different ways by the owners, thus diffusing general prosperity.

Concentrates.

THE *Record* says a miner must be Colorado's next Governor

PLACER mines in Cripple Creek, Col., pay the city a royalty of 25 per cent.

THE Challis, Idaho, *Messenger* says the Yellow Jacket will give work to 500 men this fall.

THE Nevada County Miners' Association will hold its annual meeting in Nevada City next Thursday.

THE Bland Tunnel Co. has been organized at Cochiti, N. M., with $1,000,000 capital, to pierce Gold Hill at a depth of 1000 feet.

THE old Constitution mine on Deer creek, Nevada Co., has been purchased by William Floyd and others, who will open it up.

A RICH STRIKE is reported in the Frisco mine at Bingham, Utah. Assays show 223 ounces silver, 28 per cent lead and $2.90 gold.

THE hoisting works at the Eagle Bird mine at Mayhert, Nevada Co., were destroyed by fire last week. It will be immediately rebuilt.

JACK MCKINNON reports that he is sharpening drills for a mining company at Johannesburg, South Africa, and making $250 per month thereat.

THE Eureka Mining Co., at West Point, Calaveras county, has struck a large ledge showing well in free gold and sulphurets in the bottom of the mine.

THE *Mercury* says that A. McNair has the richest quartz mine in Butte county, fourteen miles from Oroville, and that $1800 was taken out in one day last week.

ONE THOUSAND tons of ore from the Tiger mine at Burke, Idaho, are on the way to the Tacoma smelter. The ore carries forty ounces in silver and sixty-five per cent lead.

ROSEMOND, the new copper mine in the Santa Rita mountains, Arizona, gives promise of becoming a big producer of copper. Employment is given to a large number of men.

THE *New Era* says that Kennedy will teach the State of Nevada a lesson in the cheap reduction of ores. The operators now in that camp are men with experience in progressive mining.

FORTY tons of ore that had been thrown over the dump as worthless at the Japan mine, near Telluride, Col., when put through an ordinary gig and shipped to the smelter brought over $6000.

THE reward now offered for the murderers of Kneehone, the Gem, Idaho, blacksmith, is $7300. The State of Idaho offers $5000, Shoshone county $1000, and the sheriff of Shoshone county $1300.

THE Tintic, Utah, *Miner* says gold-hunters returning from Uintah are very much disgusted with that district. From their description of the country it is a good one for prospectors to keep out of.

BY a new siphon scheme for mining the bed of the Arkansas river at Granite, Colorado, it is expected to move and deposit into sluice-boxes over 3000 cubic yards of material every twenty-four hours.

B. WIRT, of Omaha, president of the Ben-Hur mine, was shot through both arms near Victor, Col., last Tuesday by six men with Winchesters, who, it is said, mistook him for the Cripple Creek sheriff.

THE Loomiston, Wash., *Journal* says that a cleanup at the Carrihoo mine at Camp McKinney last week resulted well. Nineteen days of a run gave the result of 37½ ounces of gold, or between $9000 and $10,000.

In Sierra county the Butte Saddle G. M. Co., Sierra City, has levied an assessment, No. 11, of one cent a share; and the Yeang America G. M. Co., Forest City, has levied an assessment, No. 8, of two mills a share.

THE Montreal Mining Co. has ordered a forty-stamp mill for the Viertong mine, near Tuttletown, Cal., and has thirty-five men at work. The *Herald* says it is expected to have 500 men at work in and around the mine in a month.

DURING the past year in Montana, the Parrot Company mined 53,155 tons of ore at a cost of $184,575; Heinze's Glengarry extracted 17,000 tons at a cost of $51,000, and Clark's Colusa-Parrot 16,000 tons at a cost of $32,000.

THE Cripple Creek *Miner* says that the statement of the Colorado Springs *Gazette*, that the miners are on the verge of another war, is absolutely false. A large majority of the miners are at work, and the few agitators no longer have influence.

REGARDING the Champion mine at Nevada City, the *Transcript* says the company will this week be able to start up their works and give employment in a short time to as large a number of men as they ever did, and the people there are happy over the fact.

AT the Anita mine in Florencia district near Oaxaca, Mexico, last week a fight occurred between John Merritt, the American superintendent and his four assistants and about fifty Mexican miners. Merritt and three Mexicans were killed. Merritt came from Denver.

R. B. WOODWARD, a director of the Bodie Consolidated Mining Company, has been sued by W. E. Miles for the $1000 penalty prescribed by law for the failure to make a weekly report to its stockholders of wages paid, work done, ore raised and bullion received or sold.

THE lithographic stone quarries near the head of Sycamore creek, forty miles from Prescott, Arizona, are reported developed sufficiently to reveal immense deposits of that valuable stone. C. P. Sykes has expended about $5000 on them during the last eighteen months.

THE receipts of ore and bullion in Salt Lake City for the week ending August 16th were to the aggregate value of $119,946, of which $74,650 was in ore and $45,296 in bullion. For the previous week the receipts were $83,627, of which $60,331 was in ore and $23,296 in bullion.

AT the Gwin mine work has been temporarily suspended upon the shaft to resume with the new machinery which will be placed in position this week. The company is building a telephone line from the mine to Jackson, to connect at Marre's with the other lines in the county.

THE Texas mine near Willow valley, Nevada county, is reported coming to the front again. There are several ledges on the 120 acres of patented ground, and the present owners have returns that are believed to justify putting up a twenty-stamp mill and chlorination works.

A FIRE broke out in the blacksmith shop of the Standard Consolidated Mining Company's hoisting works last Sunday, destroying the whole property, together with all the lumber, wood and coal. No one was injured, the miners escaping through the Bulwer tunnel. The loss is over $100,000, partially insured.

THE Plumas Imperial Gold Mining Company has bought C. R. Thompson's interest in the Emigrant Hill mines, including the Fairstake and other properties. Nearly a year ago the same company purchased the half interest of F. E. Thomas. This transfer gives the corporation the control of an extensive and valuable property.

THE Veta Madre mine, on Seobers hill, near Jackson, Cal., has been bonded to a San Francisco company. The first payment of $1000 is to be made in November, the second of $4000 in November, 1895, the third of $5000 in November, 1896, and the last payment of $20,000 in 1897. A contract will be let for sinking a shaft 500 feet deep.

MEN are actively prospecting the ruby sand deposits around and south of Yakutat, in northwestern Alaska. A San Francisco man is there with a machine of his own invention which he claims will work the gold-bearing sands in greater quantities and save more gold than the sluice-boxes with quicksilver riffles and copper plates for the undercurrent.

THE largest alternating current synchronous electric motor in the United States is owned by the San Miguel Consolidated Mining and Milling Company of Telluride, and it is constantly used to furnish power to the mines and mills of the company, as well as to furnish mills belonging to syndicates and individuals throughout the county, says the Telluride *Journal*.

THE Cripple Creek, Col., Gold Milling Company has decided to make additions to the Gold & Globe mill. A 200-ton sampler is to be added and also a chlorination plant to extract the gold from the plates and humping tables. The company has decided that this is the most advantageous method of treating the ores of the camp. About $35,000 will be expended.

THE Nevada *Herald* says: Dividend No. 30 has been declared by the Omaha Consolidated Mining Company. The amount is 15 cents per share on capital stock. There is considerable improvement in the appearance of the mine of late, and the chances are that further developments in the Lone Jack (adjoining the Omaha and owned by that company) will show far greater improvements.

IT is understood that the restraining order in the suit of A. Walrath et al. against the Champion Gold Mining Company has been modified so as to allow the Champion Company to extract ore from the contact ledge southerly at all points of a vertical plane drawn through the northern end of the line of the Providence mine, and to allow the latter to extract ore northerly at all points of the vertical plane.

THE Harqua Hala, Arizona, continues to turn out about $35,000 a month with forty stamps. The company now has sixty men in its employ, about half the miners being foreigners. Wages paid are $3 a day for first-class men. The deepest working is now 350 feet, and the mine bears every sign of being good for many years to come. The camp is in the midst of the desert and life there is monotonous.

THE men employed at the North Star and Empire mines, Grass Valley, were notified last Monday evening that their wages would be cut—the men receiving $3 a day to $2.50, the $2.50 men to $2.25 and the $2.25 men to $2. On Wednesday night a meeting of miners was held at Grass Valley, which was addressed by several regarding the proposed cut. It was agreed to quit work if the reduction is made, and resolutions were adopted asking every candidate for the Assembly to pledge his support to a bill to abolish compulsory trading at company stores. Several miners joined the Miners' Union. It was understood that the proposed reduction would be in force on the first of September.

THE suit of the Argonaut Mining Company against the Kennedy Mining and Milling Company has been begun. The plaintiff alleges that the defendant company has trespassed on its grounds and unlawfully taken ore, and asks judgment for $325,000, costs of suit, a temporary injunction against trespassers pending the suit, a perpetual injunction against trespass, and such other and further relief as may be just.

THERE were shipped from Georgetown, Col., during the month of July, sixty-seven cars of ore, containing 1,337,000 pounds, of a value of $93,480. Thirty-nine cars were shipped to Denver, one to Argo and twenty-seven to Pueblo. There were shipped from Empire during the same month eight cars, containing 188,000 pounds of ore, valued at $27,900. Three cars were shipped to Denver, three to Argo and two to Idaho Springs.

THE Mexican government has granted to Ferando de Leresa one of the most valuable mining concessions ever given in Mexico. It is for the working of the rich gold placers in several districts of the State of Oaxaca. The terms of the concession provide that $1,000,000 must be expended by the concessionaire within five years, and that he must erect reduction works capable of handling 400 tons of ore weekly within two years.

E. S. BAKER has bought two five-foot Huntington mills from the Sunflower mine, near Pike City, and will erect them on the Crane mine, at San Juan, Cal. The Crane is on the same ledge or formation as the Boss and the Resources, and is situated between the two. There will shortly be four, and possibly five, mills on the formation, which is about forty feet wide. They are near the town of Sweetland, and will make a lively camp.

L. M. BALDWIN was superintendent of the Valencia mines in Mexico in August, 1887. While making a tour of the mines he was fired on, was badly wounded and sought refuge in a tunnel. Mr. Baldwin surrendered himself, on promise that he would be allowed to pay a ransom and go free. The bandits hurried him down the road and in a few minutes shot him through the brain and disappeared. The Mexican Government has at last agreed to pay his widow $20,000.

THE Democratic State Convention, now in session in this city, adopted the following plank in its platform yesterday: We favor the enactment and enforcement of legislation placing the mining industry upon a basis of permanent prosperity, and are opposed to all unnecessary restraints upon the acquisition by our citizens of title to mineral lands. We favor National and State aid in the construction of such works as will promote hydraulic mining, and permit it to be carried on wherever it can be without material injury to vested rights.

GEO. W. WANLESS of Jimenez, Mexico, agent at that point for the Rio Grande Smelting Works, says that cinnabar exists in southwestern Texas, twelve miles from the Rio Grande, fifty or sixty miles from Presideno, and about eighty miles from Alpine, Texas. The cinnabar is reported in limestone associated with oxide of iron. The formation for two miles or more is horizontal. Upon determination the ore yielded as high as sulphur combines with mercury, and from that point down the scale value. No work has been done to date, the alleged discovery being in the elementary stages of development.

KENNEDY, Nev., is delighted over a big strike in the Imperial last Monday, which is interpreted to mean the permanency of the camp. The *New Era* says at a depth of 125 feet there is a solid ore body eight feet wide. A foot of the ore on the hanging wall is a clear, firm quartz, ribboned with metal, which gives $104.29 in gold, 15 ounces in silver, but no lead. The seven feet intervening to the foot wall is a mass of galena and the entire eight feet averages $20 in gold, 70 ounces in silver, and 40 per cent lead. The drift where a three-foot vein is opened returns $27.50 in gold, 17.75 ounces in silver, and five per cent lead. A concentrating test made of the ore from the north drift and bottom of the winze gave concentrates valued at $307 a ton, of which $45 was lead, $100 silver, and $162 gold, the lead reaching 72 per cent. Concentrates of this character would command a premium at any smelter. To the question, What is the Imperial mine? Manager J. F. Wardner answers: "An immense concentrating property of sulphurets of lead," and supports his statement by asserting that it will be proven the red oxide and pyrites of the surface are the iron capping of vast bodies of lead carrying gold and silver.

Personal.

W. C. RALSTON has returned from a business trip to Plumas county.

J. J. CRAWFORD, State Mineralogist, is making a personal investigation in Siskiyou county.

B. F. PEART, of this city, is the superintendent of the Viertong mine, near Tuttletown, Cal.

PROF. AUG. J. BOWIE, consulting engineer in charge of the Lemhi placers of Lemhi county, Idaho, is in Denver, Col.

CONGRESSMAN CAMINETTI of Amador received the merited recognition of a unanimous nomination from the Second Congressional District at the Democratic convention in this city last Wednesday.

COUNT DES GARETS, a grand nephew of Lafayette and L. Pelatan of Paris; J. H. Brotherton and A. M. Fletcher of London, having mines in Sierra county, California, and in Idaho, are visiting their property.

FELIX CHAPPELET is back from his Chili Gulch gravel property in Calaveras county, where a quartz ledge was recently cut by a tunnel. Mr. Chappelet inclines to the opinion that the ledge is an extension of the mother lode.

PROF. GUSTAV EISEN and Frank Vaslit of the Academy of Sciences leave to-day for a lengthened sojourn in Lower California and Sinaloa, Mexico. The expedition is purely a scientific one, and is justly expected to be rich in results.

SENATOR GEO. PERKINS is back from Washington. It was largely due to his efforts that the two-cent rate was put on borax in the new tariff law and the duty of seven cents on quicksilver which, though three cents less than the old rate, is better for the California producers of quicksilver than to have it free, as was at first proposed.

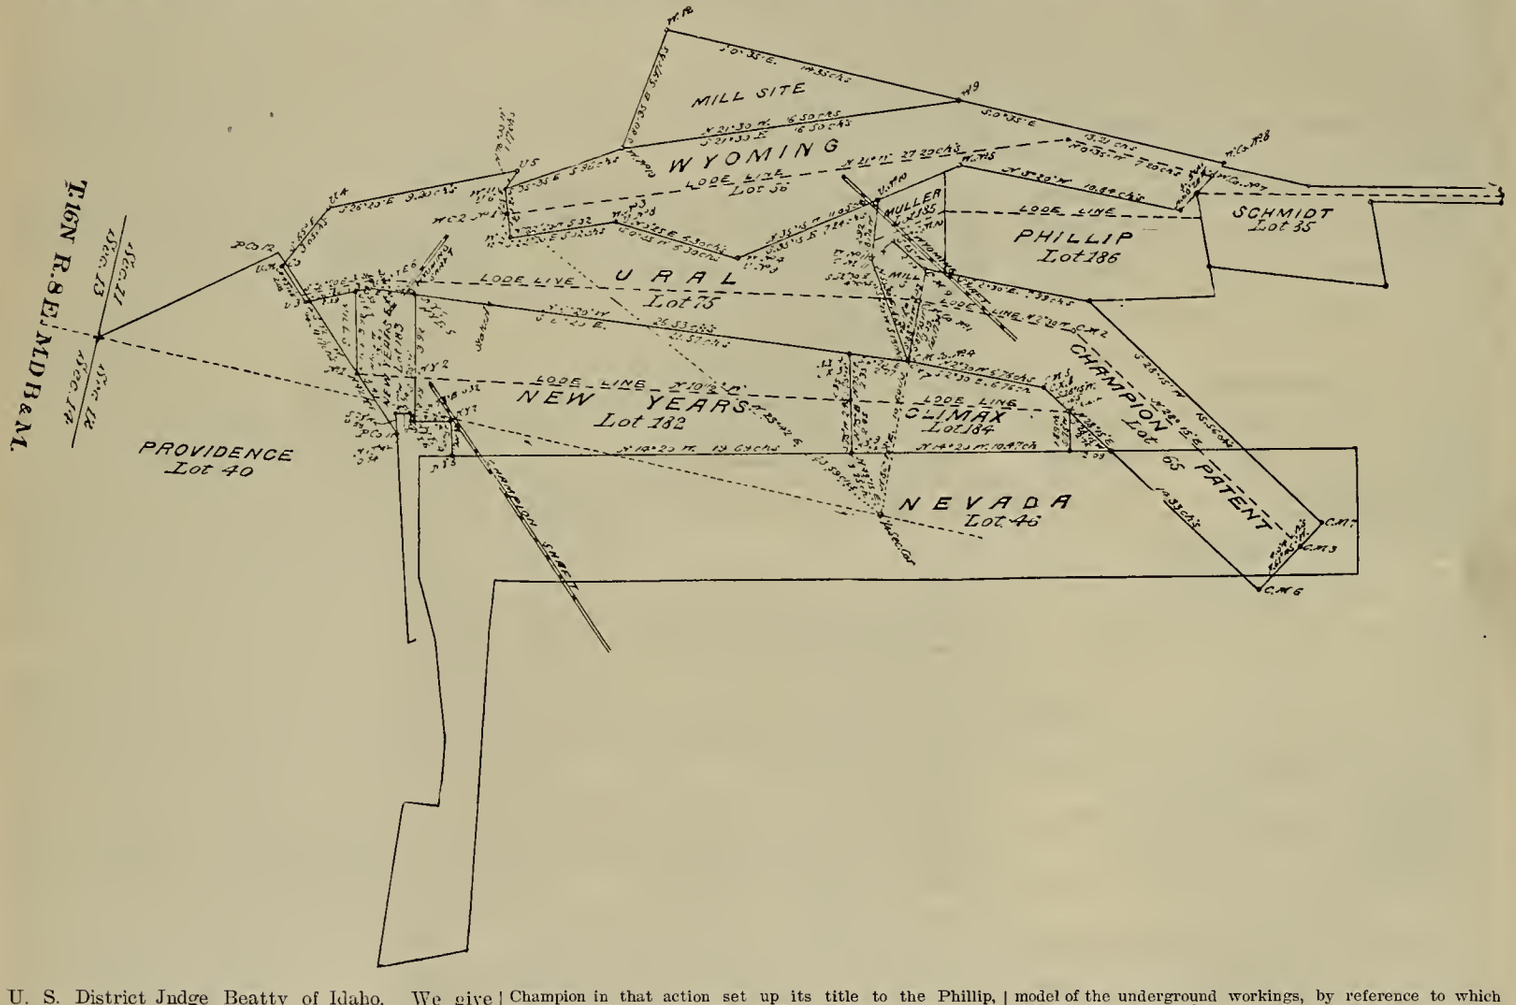
The Con. Wyoming-Champion Decision.

Consolidated Wyoming Gold Mining Company, Complainant, vs. Champion Mining Company, Respondent.—In the Circuit Court of the United States for the Ninth Circuit.

The trial of this canse began before Hon. Thos. P. Hawley, U. S. District Jndge for Nevada, at San Francisco on May 15, 1894, and continned until it was snbmitted on June 1, 1894, John M. Wright, Esq., of Oakland, and W. S. Wood, Esq., of San Francisco, representing the complainant, and Messrs. Lindley & Eickhoff and George Hoeffer, Esq., all of San Francisco, representing the respondent.

Because of the many important qnestions involved and settled, and particnlarly becanse it is the first jndicial interpretation of the now celebrated "Amy case," many attorneys consider this the most important mining case tried in any court in California since the debris question was settled.

The decision of Jndge Hawley was handed down Angnst 13, 1894, at San Francisco, being read by U. S. District Jndge Beatty of Idaho. We give the entire opinion below.



The snbject of extra lateral rights attaching to claims located prior to May 10, 1892, having nonparallel end lines, the subject of extra lateral rights where a lode passes into a claim through one end line and out across a side line, the subject of the uuion of veins on their dip as well as on their strike, and the subject of lode definition are all ably discussed and interpreted. The definition of a lode set forth follows closely that given by Prof. Ross E. Browne iu the testimony and is one of the most valuable to be fonnd in any of the cases.

The opinion is as follows:

This is an action of trespass, with a prayer for equitahle relief, for an accounting and an injunction.

It was commenced in the Superior Court of Nevada county and removed to this Court by respondent, upou the ground that it involved a construction of the United States statutes relating to miuing claims.

1. A motion was made by complainant to remand the cause to the State Court upon the ground that there was a prior judgmeut in the State Court hetween the same parties which left no issue to he litigated except the fact and extent of the trespass, and that no federal question was involved.

This motiou was denied and a plea in ahatement to the jurisdiction of this Court was overruled hy the Circuit judge.

Complainant is the owner of the Wyoming and Ural quartz lodes aud mines, for each of which it has a United States patent. The patent for the Wyoming lode was issued September 19, 1874, and is based upon a location, or occupancy, of the lode claim prior to 1872. The patent recites the fact that it is granted under the law of 1866, and the acts amendatory thereof of 1870 and 1872. It grants 2270 40-100 linear feet of the Wyoming lode and certain surface grcund which is particularly defined by metes and hounds. The patent to the Ural lode for 2000 linear feet and the surface ground was issued May 12, 1880. It recites tbe fact that it is issued under certain sections of the Revised Statutes of the Uuited States, which includes the statutes of 1866, 1870 and 1872. Both of said patents contain a grant of the mining premises substantially in the language of Section 2322, Revised Statutes United States.

The respondent is the owner of the New Years and New Years Extension, upon which it particularly relies, aud of the Climax and certain other claims which need not he specifically mentioned, and its title thereto is evidenced hy a certificate of purchase from the United States Land Office, which is admitted to he equivalent to a patent from the Government.

The title of claimant to its Wyoming and Ural claims is prior in point of time to that of respondent to its claims.

There is no dispute whatever as to the surface lines of the respective claims.

It is admitted hy claimant that, whatever its rights to the Wyoming and Ural lodes were prior to its application for a patent, when it had these claims surveyed by the United States surveyor and permitted him to draw the end lines it is estopped, under its patent, from any further claim outside of the lines that were fixed hy the surveyor, and that its extra lateral rights—which constitute the principal hone of contention in this case—are confined to planes drawn downward through the end lines of the survey and extended indefinitely, and that at a certain depth these end line planes would come together and its extra lateral rights would be entirely cut off.

The former judgment in the State Court was rendered in an action hrought hy the Champion Gold Mining Company (respondent in this action) against the Consolidated Wyoming Company (complainant here).

The trespass there alleged was upon the Phillip ground helonging to the Champion, which is not here involved—hut the Champion in that action set up its title to the Phillip, Champion, Climax, New Years, New Years Extension, and the Annex mining claims, and included the ground in controversy in this action.

The question of end lines was there in issue and the Court found that a certain course described in the pleadings was the course of the southern end line of the Ural quartz mine.

The question of the junction of the Wyoming and Ural lodes was also presented. The judgment in that case reads as follows: "Now, therefore, it is considered, adjudged and decreed that plaintiff have judgment against the defendant for the sum of one hundred and twenty dollars, with its costs therein expended up to the time of filing of the answer to the amended complaint; that plaintiff is not entitled to any injunction or other relief against defendant; that defendant is entitled to work its Wyoming mine along and all points helow the junction tbereof with the Phillips mine of plaintiff and it is entitled to work hoth its Wyoming and Ural mines at any point helow where either of said mines on its dip may unite with the New Years or Climax, or New Years Extension, or Annex mines of the plaintiff, and that defendant have and recover its costs herein expended since the filing of its said answer to amended complaint." An appeal was taken to the Supreme Court and the judgment was affirmed. Champion vs. Wyoming, 75 Cal., 78.

The admissihility of this judgment as evidence was passed upon by the Circuit Judge in deciding that this Court had jurisdiction of this case, and these questions will not he reviewed.

The above diagram shows the surface houndaries of the respective claims and the lode lines of the respective lodes as defined aud represented in the patents, and contains the stipulation of the parties in regard thereto and with reference to the former judgment hetween the same parties in the State Court.

The lode lines represented on this diagram are ideal, as distinguished from the actual lines of the lodes as shown hy the testimony. The line of outcropping of the Wyoming and Ural lodes with the underground workings of the Wyoming and Champion companies are shown upon diagram on the opposite page.

The outcrop of the respective lodes upon tbe surface is not continuous nor well defined, hut it has been exposed in a sufficient numher of places to sbow—when taken in connection with the underground workings—that the general course of the croppings as delineated on the diagram is substantially correct.

The apex of the Wyoming lode is clearly established within the surface houndries of the Wyoming claim and the lode extends throughout the entire length of said claim through the northern aud southern end lines thereof. The apex of the Ural is shown to he in the Ural claim aud the lode extends from the uortherly end line through the claim in a southerly direction for ahout 1400 fect and then crosses the eastern side line of the Ural, as delineated on the diagram, at a point ahout 600 feet from the southerly end line of the Ural surface location.

The walls of the Wyoming lode are hoth slate, and in the testimony the Wyoming is called the "slate" vein.

The Ural lode has a hanging wall of granite, or diorite, and the footwall is slate, and this is called the "contact" vein.

The slate vein extends dowuward into the earth at an angle of ahout 25 degrees to the southeast. The contact exteuds downward in the same general direction at an angle of ahout 35 degrees.

There are numerous controverted questions of fact, as well as of law, that will have to he solved in order to determiue the rights of the respective parties.

2. Before discussing any of the controverted, conflicting and somewhat complicated questions of fact, it is proper to say that both parties had several large maps carefully drawn and prepared in such a manner as to materially aid them in presenting the testimony of the respective witnesses in a clear and concise manner. Each party also introduced a large model of the underground workings, by reference to which the Court was ahle to follow the witnesses as they gave their testimony concerning their examination of the several drifts, tunnels, upraises, winzes and levels exposed in the underground workings of the respective claims. The testimony was presented, and the whole case tried, in an intelligent and satisfactory manner. Counsel were fair and courteous to the Court, to the witnesses and to each other. Questions not in real dispute were readily admitted. Each party pursued a similar line of examination by first introducing their surveyors, second, the superintendent, or underground foreman, third, practical and experienced miners, and fourth, one expert on each side. The witnesses were intelligent men aud favorably impressed the Court that they intended to tell the truth and detail the facts as they appeared to them, without any hesitation or equivocation. Both counsel and witnesses demeaned themselves throughout the long and tedious trial in such a manner as to receive the commendation of the Court for their honesty, frankness, ahility and courtesy.

The case was tried with extreme caution so as to cover every possihle phase that might he taken of the numerous questions involved. The result is that many of the questions raised, and much of the testimony taken, become unimportant in the light of the conclusions reached hy the Court.

It is not deemed necessary to enter into any extended statement of the facts. The record is large, perfect and complete. The various links in the chain of evidence are too numerous to warrant any minute attempt to show how they are welded together. The principal contention upon the part of the complainant is that the Wyoming or slate vein, and the Ural or contact vein in their downward course from the surface unite and form a junction and that from the point of junction downward there is hut one lode or vein, and that is a contact vein hetween granite and slate walls.

The coutention of respondent relative to this question is, that there is a middle vein hetween the 300 and 400-foot levels from the Champion shaft which is a separate and wholly independent vein in a different fold of slate from the Wyoming lode, which has its apex within the lines of respondent's claims; that the Wyoming lode or slate vein does not unite with, intersect or touch the contact vein.

From tbe impressions received at the trial, and from a careful review and examination of the testimony as it appears in

the record, my conclusion is that the union of the Wyoming and Ural lodes is clearly established by the weight of the evidence, as contended for by the complainant.

In this connection some general views will be given as to what constitutes a lode or vein. In Book vs. Justice M. Co., 58 Fed. 121, I stated that the statute upon this subject "was intended to be liberal and broad enough to apply to any kind of a lode or vein of quartz or other rock-bearing mineral, in whatever kind or character of formation the mineral might be found. It should be so construed as to protect locators of mining claims who have discovered rock in place bearing any of the precious metals named therein, sufficient to justify the locators in expending their time and money in prospecting and developing the ground located."

The character of the formation in which the veins and lodes are found in the ground in controversy, is entirely different from that which was found to exist in Book vs. Justice, but the quotation therefrom is as applicable to fissure veins as it is to the mineralized zones. In defining lodes and veins the text books and several of the decisions speak of them as fissures in the earth filled with quartz in place carrying gold and silver or other minerals. But true fissure veins and lodes often exist and are continuous without having any filling in certain points or places of mineral matter. A majority of such lodes have, in addition to the clean fissure filling of mineral, a considerable amount of decomposed wall rock, clay, etc.

In slate formations, as was said by Professor Browne, in giving his testimony in this case, it frequently occurs that one of the walls has been subjected to a certain amount of fracture which results in the formation of a number of seams, and in the decomposition of the material included between the seams of unaffected wall rock which miners designate as horses.

To constitute a vein it is not absolutely necessary that there should be a clean fissure filled with mineral, but it may and does exist when filled in places with other matter. The fissure should, of course, have form and be well defined, with hanging and foot walls. Between these walls will be found bodies of quartz, rich and poor, but there is also liable to be found, in many places, short or long distances between the quartz bodies or pay chutes, where no quartz will be found in the fissure between the walls. Yet the vein exists, and is often as well defined as if the same was filled with quartz. The clay, the selvages, slickensides, striation and ribbing of the walls, are frequently as strong evidence of the indication of permanency and continuity as the existence of the quartz itself. Under this definition, the existence and continuity of the slate and contact veins were proven to exist in length and depth throughout the various underground workings by evidence of a convincing character.

During the trial respondent objected to any testimony being given as to the condition or existence of the lodes upon the surface or in the underground workings in the northern portions of the ground, as only the southern portion was really in dispute. I am of opinion that this testimony was admissible, although, in the light of the former judgment and of other features in the case, perhaps unnecessary, as hearing more or less directly upon the question of the union of the two veins in the southern part.

It was shown that the complainant's witnesses in tracing the slate vein downward in the southerly part of the claim, where nearly all of the contests between the parties exist, followed the foot wall of said vein through divers tunnels, inclines, etc., etc., bringing them directly to the contact vein where, as they testify, there was a distinct union of the lodes, the quartz of the slate vein, in some places that were closely examined, entering and joining with the quartz of the contact vein. This condition of affairs is not only found to exist in the southern part, especially in conflict, by the weight of evidence, but is shown by undisputed testimony to have existed at several points in the middle and northern portions of the ground where the ore in the veins has been extracted. The established line of croppings extending through the northern, middle and a portion of the southern part of the ground, running, as they do, in substantially the same general direction and descending into the earth at the different angles specified, shows clearly that if both lodes are continuous they would naturally come together, because you cannot have two separate lodes of ore, or vein matter, going into the earth at the angles and in the manner shown to exist here without their coming together, if both are continuous. Then again there are two branches or separate lodes or veins of ore, one in slate, the other in contact, above the point of junction, and there is but one vein below that point. Without entering into the field of geological science as to the formation of veins and the filling of the cracks or fissures in the earth, it is evident that all the fissures in the ground in controversy were filled, as Professor Janin states, at the same period of time by the same force of nature, whether filled from above, or laterally, or came up from below. All of these facts tend more to less to sustain and strengthen the positive testimony of complainant's witnesses that there is a union of the two lodes. It will be observed that this conclusion is reached independent of any question as to the extent and effect of the former judgment. It is, therefore, unnecessary to discuss the question upon which respondent relied and in regard to which numerous authorities were cited, whether respondent, by its certificate of purchase from the Government, had obtained a subsequent acquired title that could be set up against the judgment. Respondent contends that it should be established by the evidence, to the satisfaction of the Court, that the slate vein unites with the contact, yet it is a union on the strike and not upon the dip. Upon this question there is also a conflict of evidence, the weight of which establishes the fact to be that the line of the union is irregular. It cannot accurately be said that there is a union on the strike only, or a union on the dip only. The line of union varies at different places. The union at the north and south ends of the ground is found at a greater depth than in the middle part. The fact is that the union is partly on the strike and partly on the dip. The weight of the testimony touching this point establishes the fact that the union is more upon the dip than upon the strike.

The views already expressed are conclusive upon the point that complainant, by virtue of its ownership of the slate vein in the Wyoming is entitled to an injunction to prevent respondent from working northerly of a line drawn downward vertically with the southerly end line of the Wyoming claim. If no other portion of the ground was in controversy the decision of the case might be safely rested here without any discussion of the many other questions presented at the trial, because the laws of the United States provide that "where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection." Revised Statutes U. S., Sec. 2336.

This provision is held not to be in conflict with the provisions of section 2322. Wilhelm vs. Sylvester, 35 Pac. 997; Watervale M. Co. vs. Leach, 33 Pac. Rep. 418.

Complainant would, therefore, take the ground to the full extent stated—that is, between the end line bounding planes of the Wyoming claim extended in their downward course, independent of any rights it may have by virtue of its patent to the Ural lode and surface location.

4. What are the rights of the complainant under the Ural location and patent?

Respondent's counsel claim that no extra lateral rights attached to the contact vein because it crossed the easterly side line of the surface location of the Ural claim before reaching the southerly end line of the location.

This point was not seriously urged, but it was intimated and suggested that the opinion of the Supreme Court in King vs. Amy Silversmith M. Co., 152 U. S. 222, is susceptible of that construction. If that case is not fairly susceptible of such a construction, then it is, of course, conceded that Tyler vs. Sweeney, 54 Fed. 284, and Last Chance M. Co. vs. Tyler M. Co., 61 Fed. 557, are conclusive in favor of complainant's right to all that portion of the Ural lode, the apex of which is within the surface ground of the Ural survey and location. I am of opinion that the decision of the Supreme Court of the United States is not in conflict with the Tyler cases decided in the Court of Appeals for this circuit.

It is a universal rule of construction that the decisions of Courts are to be interpreted with reference to the facts in each particular case. In the Amy case the Court held that the side lines of the claim constituted the end lines of the location. Why? Because "the lines marked as side lines cross the course of the strike of the vein and do not run parallel with it." It would be a contortion of the facts and of the law to construe the principles announced in the Amy case as applicable to a location like the Ural, where the lode, as located by the surface claim, crosses through the northerly end line and runs nearly parallel with the side lines for a distance of about 1400 feet, when it changes its course and crosses the easterly side line of the surface location about 600 feet north of the southerly end line of the location. It cannot, it seems to me, consistently be said that complainant is deprived of any of its extra lateral rights to the 1400 feet, more or less, which is all entirely within the surface lines of the Ural patent, and substantially parallel with the side lines as marked upon the surface ground.

The Statute of the United States is not, in my opinion, susceptible of any such construction, and no decision of any National or State Court has ever gone to that extent. The Supreme Court of the United States in the Amy case simply decided that when a mining claim is located across, instead of along the lode, its side lines must be treated as its end lines and its end lines as its side lines; so that, under the Revised Statutes, Sec. 2322, the dip cannot be followed outside the vertical plane of the original side lines into an adjoining claim.

There is nothing in either of the opinions of the Circuit Court of Appeals in the Tyler cases which is at variance with this principle. On the contrary, this rule is expressly recognized. But it is true that there is an expression in the Tyler case to the effect that the question whether the lode crosses the side line more nearly at right angles than along the course of the side lines should always be considered.

This particular position, which is deemed sound and just, was not discussed in the Amy case, and was not, perhaps, involved in that decision. One illustration will be sufficient to show the justice of the position as stated in the Tyler cases, although that particular question is not here involved:

Let us suppose that a location is made under the Act of 1872, in the form of a parallelogram 1500 feet in length and 600 feet in width; that the lode enters one of the side lines within five feet of one of the end lines of the location; that it then continues upon its strike, nearly parallel with the side lines, until it comes within five feet of the other end line and then changes its course so as to cross the other side line. This lode does not pass through either end line, yet under the rule announced in the Tyler cases the locator would be entitled to 1490 feet lengthwise upon the lode and to follow it for that distance upon its dip vertically downward as expressed in the statute. I am of opinion that in such cases the statute is definite enough, and clear enough, to make the end lines parallel at the point of entrance and of the departure of the lode across the side lines and to draw them crosswise of the general course of the lode within the limits of the surface location, and that this should always be done so as to give to the locator just what the statute evidently intended he should have, instead of depriving him of all extra lateral rights because by some mistake or oversight in marking his lines, or by lack of judgment or knowledge as to where the lode ran, he had failed to get his lines exactly parallel with the lode, and had marked his end lines at a point beyond where the lode was found to exist upon its strike within the surface lines of his location. But, be this as it may, the Amy case does not go to the extent of deciding that if the lode passes through one end line and in its entire course is nearly parallel with the side line which it crosses before reaching the other end line, the locator would be deprived of all his extra lateral rights.

In a majority of cases where mining locations are made in the form of a parallelogram under the Act of 1872, the lode or vein located does not run lengthwise directly parallel with the side lines of the location. The statute is based upon ideal locations of parallelism that seldom, if ever, exist. It is, in fact, almost impossible to make a perfect surface location, the side lines of which would be absolutely parallel with the lode or the end lines precisely at right angles with the strike of the lode, no matter what length of time is taken before marking the surface boundaries of the location. If the locator makes his location crosswise instead of lengthwise of the lode, then the end lines of the location become side lines, and he can only take so much of the lode lengthwise as lies within the surface lines of his location. But, if the lode runs like the contact vein does, through the Ural surface ground, there is no substantial reason that would justify a court in declaring that the locator would not be entitled to any extra lateral rights. No such construction has ever been given to the statute. There is but little, if any, force in the suggestion often made that the locator should postpone the marking of his boundaries until sufficient explorations are made to ascertain the "true course and direction of the vein." The present case furnishes a fair example of the difficulties so often encountered by the miner in his efforts to determine the direction of the vein he has discovered.

The Wyoming vein has been located, and at different times worked upon, during the past forty years, and it is still a disputed and closely contested question as to where the lode actually runs, and, in addition to all of the regular workings of the mine, it has required the expenditure of money, time and labor, in order to enable the witnesses to testify with any degree of certainty the "true course and direction of the vein." Every practical miner knows the difficulty that is often experienced in ascertaining these facts. The truth is that the miner is often compelled by the law to make his lines of location upon the surface ground before such facts can be ascertained. There is a limit to the time he can take before marking the boundaries of his claim. He is required to exercise his best judgment from the developments he has been able to make, and he is, of course, confined to his surface location whether his judgment was right or wrong. The statute should be so construed as to give to the locator what he actually locates—no more and no less. It should be liberally construed in his favor, so as to give him the full benefit of the statute in its true spirit and intent in order to carry out the wise and beneficent policy of the General Government in opening up the mineral lands for exploration and development. When the prospector discovers a vein of ore of sufficient value to justify the expenditure of time, labor and money to open up and develop the same, he is honestly and legally entitled to the fruits of his labor. He is admonished by the law that he will be limited in the length of his lode upon its strike to such portions as is within the surface lines of his location, but he is at the same time assured that he

will not be limited or deprived of his extra lateral rights as to the depth of such lode upon its dip, the apex of which is within the surface lines of his location.

The statute of 1872 gives to locators of mining claims "the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations."

These are their extra lateral rights which should neither be extended nor restricted by the courts. The only limit placed by the statute is that "their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward, as above described, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges."

One general principle should pervade and control the various conditions found to exist in different locations, and its guiding star should be to preserve, in all cases, the essential right given by the statute to follow the lode upon its dip, as well as upon the strike, to so much thereof as its apex is found within the surface lines of the location. If the lode runs more nearly parallel with the end lines than with the side lines as marked on the ground as such, then the end lines of the location must be considered by the courts as the side lines meant by the statute. If the lode runs more nearly parallel with the side lines than the end lines, then the end lines as marked on the ground are considered by the Court as the end lines of the location. In both cases the extra lateral rights are preserved and maintained as defined in the statute.

It may be admitted, as was suggested by counsel in this case, that it would be an herculean task to endeavor to fathom the complications that are liable to arise in the construction of this statute and to provide for their solution upon any defined method of interpretation. One thing, however, is certain, that unless it can be done, then the statute is radically wrong, and the sooner amendments are made thereto, to avoid such difficulties, the better it will be for the mining industry of the country. In fact, it is a question worthy of consideration whether it would not be advisable to have the mining laws amended so as to adopt the Spanish, Mexican and Roman rules and give to the miners a greater width of ground upon the surface, making a square location, and confine the owner of the claim to the ground within the boundary planes of his location in length, width and depth, the same as agricultural land, so as to avoid any further conflict over side and end line propositions that are becoming such fruitful themes of endless dispute and litigation. This is a question, however, that is solely within the province and discretion of Congress.

It will be noticed that the end lines of the Ural are not parallel with each other. The location was made under the laws of 1866, which did not require parallelism of the end lines.

Walrath vs. Champion, post, and authorities there cited.

It was admitted upon the trial by complainant that the northerly end line of the Ural location was the more easterly instead of westerly part thereof, to-wit, the line from C. M. 11, S 56° 10' W., 5 13-100 chains to C. M. Co., No. 4, as shown in the diagram taken from the stipulated map. A line drawn across the Ural location parallel with this northerly end line so as to strike the point where the Ural or contact vein crosses the easterly side line of the Ural location would be the southerly end line of the contact vein, and these end lines extended vertically downward would define the rights which complainant is entitled to under its ownership and patent of the Ural lode.

5. What are the rights of complainant, under and by virtue of its patent to the Ural ground, to the southerly part of the Wyoming or slate vein after it crosses the southerly end line of the Wyoming location? Section 2322 of the Revised Statutes heretofore quoted gave to the owners of the Ural lode and surface location all other veins, lodes and ledges throughout their entire depth, the top and apex of which lies inside of such surface lines extended downward vertically. This portion of the Wyoming lode was not located by complainant. It was the Ural lode for which the patent was obtained, and, under the law of 1866, this was the only lode that was granted; but when the Act of 1872 was passed it was so framed as to apply to all mining locations heretofore made as well as to all others to be thereafter made, and the complainant is the owner of so much of the slate or Wyoming vein as has its apex within the surface of the Ural location. But here we are met with the difficulty of determining from the evidence how far the apex of this vein is shown in the Ural claim after leaving the south end line of the Wyoming surface location. This is the most difficult and doubtful question of fact that is presented to the Court for its determination. The testimony as to the existence of the slate vein to certain points southerly near the mouth of the Wyoming shaft may be said to be fairly established by the evidence. South of that point to the southerly end of the Ural it is not well defined and is not clearly proven. The Court is left in doubt as to the truth. The impression received from an examination of the record might be said to be that the probabilities are in favor of that vein extending through the Ural ground, as claimed by the complainant. But the Court is not prepared to say that the fact of its existence to that extent has been proven to its satisfaction, and this should be clearly shown before the Court would be justified in giving to complainant the right to follow underneath within the surface lines of the New Years and New Years Extension claims belonging to respondent. The respondent has the undoubted right to say to the complainant, "Hands off of any and everything within my surface lines extending vertically downward, until you prove that you are working upon and following a vein which has its apex within your surface claim of which you are the owner!"

Judge Hallett, in Leadville M. Co. vs. Fitzgerald, 4 M. Rep., 385, expresses the true rule upon this subject, as follows: "Within the lines of each location the owner shall be regarded as having full right to all that may be found, until some one can show a clear title to it as a part of some lode or vein having its top or apex in other territory. In other words, we may say that there is a presumption of ownership in every locator as to the territory covered by his location, and within his own lines he shall be regarded as the owner of all valuable deposits until some one else shall show by a preponderance of testimony that such deposits belong to another lode having its top or apex elsewhere." See also Doe vs. Waterloo, 54 Fed. 937; Duggan vs. Davey, 26 N. W. 892.

The facts do not show by preponderance of evidence that the slate vein extends any further south than the southerly end line plane of the Ural drawn as before stated it should be, and as the slate vein is not clearly shown to pass that line going south I am of opinion that complainant is not entitled to any further or other rights than has already been given to it by virtue of its patent to the Ural or contact lode. The same result would be reached if the Court should accept the doctrine announced in Patterson vs. Hitchcock, 3 Col. 533, and followed in Armstrong vs. Lower, 6 Col. 399, that, "if the lode located terminates at any point within the location, or departs at any point from the side lines, the location beyond such point is defeasible if not void."

6. With reference to complainant's rights there is one novel proposition, seriously and earnestly advanced by complainant's counsel, that demands consideration. It is substantially to the effect that where the patent conveys a lode and independently and clearly marks in out, as the Land Office has a right to do and did do in this case, then no collateral attack can be made to the patent so as to show that the lode is in another place from that marked out in the patent, and it was argued that there was a distinction, which should be observed and followed by the Court, between a patent where there is no lode distinctly granted by a specific definition, where the Court must naturally enquire as to its existence and extent in order to determine the rights of the parties, and a case where a patent recites the direction and course of the lode. In the latter case it is claimed that while the Government of the United States might enquire as to its truth, that no collateral attack could be made upon it by the owners of other mining locations; that the Court is absolutely bound to proceed and act upon the theory that the Land Office ascertained the facts before it granted the patent; that the definition of the Ural lode is as complete and perfect to all intents and purposes as it is to the surface boundary lines of the ground itself within which it is included, and upon these grounds complainant denies the right of respondent to show that the Ural or contact vein does not run along the dotted line of the patent, as shown in the diagram, clear through the Ural claim, from end to end of the location and survey. The reply to this is that respondent is not assailing the patent in any manner whatever. It does not deny its validity. It admits that complainant has the title to the contact vein and to every other lode or vein within the limits of the surface location of the Ural claim. It denies and has the right to deny that any portion of the Ural lode situate southerly from the point where it crosses the easterly side line of the Ural location has its apex within the Ural claim. The answer heretofore given that complainant must prove that the vein it claims within the surface lines of another mining company has its apex within the lines of its own claim is directly applicable to this contention. This Court cannot presume that the Land Office determined the course of the lode. The marking of an ideal line across the survey and diagram did not have the effect of putting a lode into the ground if there was no vein there. The respondent has the right to show what the facts are.

Mr. Justice Miller, in answering a somewhat similar contention, in his instructions to the jury, Stevens vs. Williams, 1 McCrary, 480, said: "The plaintiff has asked certain instructions which I have refused, * * * and I regret that they should have been introduced. * * * I am asked by him to state that the patent which he has received from the United States for the iron mine is conclusive that the sheet of mineral matter in question is a vein within the meaning of the statute. I decline to give this instruction. Certainly, outside of the vertical projection of the side lines of the plaintiff's patented ground, if the defendants can show that the mineral matter which is the subject of this controversy is not a vein, they have the right to show it. Outside of the side lines of the plaintiff projected perpendicularly downward defendants have the right, if they can, to show that the vein, or thing which is called a vein, is not a vein."

7. One more question and the case is disposed of: It is claimed by respondent that under the form of the pleadings in this case the complainant is not entitled to an accounting; that this action is really an ancillary action at law, and that complainant should have divided its case and gone upon the law side for its damages and upon the equity side for its injunction. Such is the common, and, as I think, the better practice, and more in accordance with the rules of this Court. But a vast number of authorities were cited by counsel, the weight of which seems to sustain the right of complainant under the pleadings to an accounting as well as to an injunction.

Let a decree be drawn in conformity with this opinion for an injunction, and for an accounting.

A Sophist.

Mr. Ohleyer, in the Marysville *Appeal*, characterizes the hydraulic section of Nevada county as a "worked out mining section." If that be a true characterization, says the *Herald*, there is little need of fear of mining debris from Nevada county. Some of the best hydraulic mines in the county would require many thousands of dollars to equip them for work. After so long an enforced idleness flumes have decayed, pipes have rotted, and new machinery of all kinds have to be bought. If the section were known to be worked out, no one would go to the expense of starting these mines, and, if they did, they would not long work them if there were no returns.

But we know these mines would start up again and give new life to this country if restraining dams could be built. Mr. Ohleyer knows this also; but he has allowed his zeal to get the better of his judgement, and has made a statement that is either false or it shows the valley people to be unnecessarily alarmed at the prospect of a dams being built on the Yuba.

If the section is worked out there will be no more hydraulic mining, and the dam would be of benefit to the valley only. If the mines are not worked out, the dam would restrain the debris from them when they work again, as well as that which is already in the river, thus benefiting both the miner and the farmer. This is a plain proposition.

The writer, however, shows his real position when he says: "There must be no more such use made of the public streams as heretofore, dams or no dams." If this were a "worked out section" there would be no desire to use the dams as heretofore. The truth is that the well known fact that there are millions of dollars yet in the hydraulic mines of this county makes it certain that they will be worked some time. The Government can not afford to do without this gold. If it is willing to help build dams to hold the debris, why should anyone object? The Government will be benefited as much as any individual. A resort to sophistry will not make out a case for you, Mr. Ohleyer.

Unemployed Labor.

A meeting was held at Dillman's Hall last night of about 200 ex-employes of the railroad shops. They decided to form themselves into a joint stock company and by capitalizing their labor, to be the better enabled to secure remunerative employment.

S. E. May, Joseph Ploner, J. J. Harrell, C. E. Adams and H. Pollack were appointed an executive committee to confer with the owners of idle hydraulic and other mines in Nevada county with a view of going to work upon those mines.

Another meeting will be held in the same place tomorrow evening.

The above is from the Sacramento *Bee*. What in the world the unemployed are going to do here among the hydraulic mines is more than we know, as there is not one hydraulic mine running, and as for the quartz mines around here, there are idle miners enough to run a dozen more mines.—Grass Valley Telegraph.

A Colorado Gold Mine.

NO. III.

Fig. 17 is from a photograph of the inclined shaft, whose slant is 25 degrees from the vertical. Fig. 18 shows its plan and vertical section.

The timber is cut 12x12 inches square set.
Center piece 6x12 inches.
Studdles 12x12 inches.

Sets are 5 feet from center to center, and lagged with 3-inch plank.

Each set is drawn together with bolts, drawn to

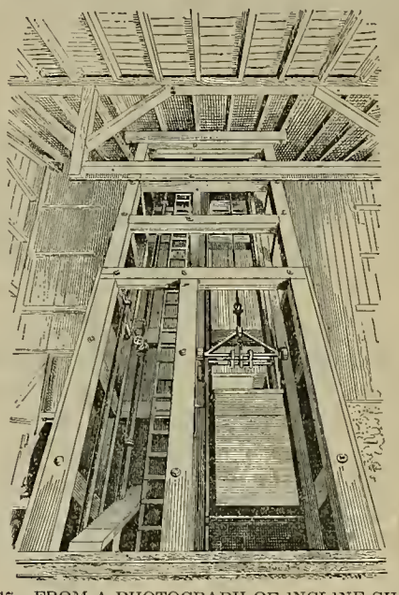


FIG. 17. FROM A PHOTOGRAPH OF INCLINE SHAFT.

place, lined and wedged up. The bolts are then withdrawn from the third lowest set or reversed.

The number of miners at present at the Standley Consolidated, which has been described and illustrated in the article of which this is the third and last installment, is 75; surface workmen, 10; 1 fore-

man and 1 shift boss; length of working shift, 9 hours; number of shifts, 2; wages per shift, $2.50 to $3; cost of sinking shafting is $20 per foot; drifting on levels, air drill, $3 per foot; drifting is by contract, stoping by day's pay; cost of timber stulls, not less than 12 inches tips and 16 feet long, is $1; of lagging 6-inch tips and 16 feet long, 20 cents; lumber, $15; fuel coal, $3 per ton; iron, 3 cents per foot; steel, 9 cents; Atlas powder, 13 cents; caudles, $4 per box; cost of mining a ton of ore, $2.

A. Walrath et al. vs. Champion Mining Co.

Decision in the Circuit Court of the United States, Ninth Circuit—Hon. Thos. P. Hawley, Judge.

The following decision was read by Judge Beatty in this city on the 13th inst. It is published in full, together with a diagram of the disputed ground:

This action is of the same character as the Con. Wyoming-Champion, just decided, and may be said to be a companion case, as it involves the title to a small segment of mining ground of the "contact" vein situate farther south.

The Providence mine was located in July, 1857, in conformity with the local rules and regulations of the miners in the mining district where the claim is located. On the 28th of April, 1871, a patent was obtained from the Government of the United States for 3100 linear feet of the Providence lode and for certain surface ground of irregular shape and form. This patent was issued under the provisions of the Act of Congress of July, 1866, and the grant was "restricted to one vein, ledge or lode," and to the surface ground particularly described by metes and bounds.

Complainant derives his title to the Providence lode under said patent, as a cotenant.

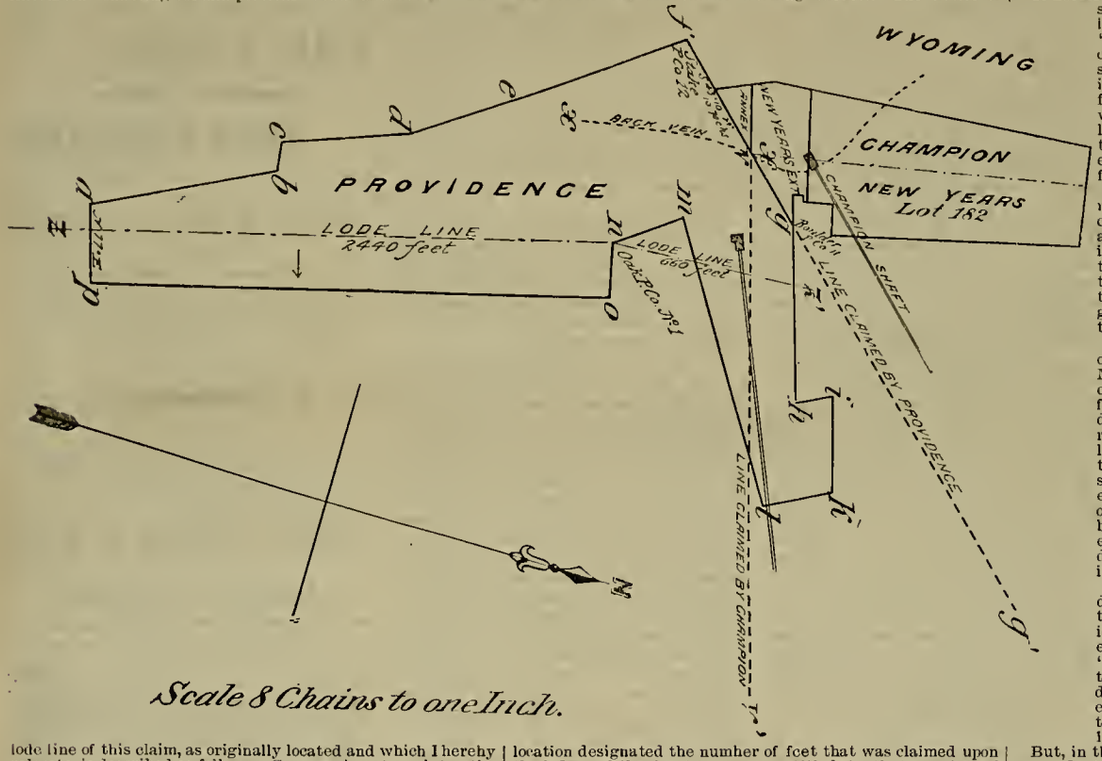
The respondent is the owner of the mining claims and ground known as the "New Years" and "New Years Extension." Its right to these claims was acquired subsequent to the Act of Congress of 1872, and is evidenced by a receipt and certificate of purchase from the United States Land Office, which is the equivalent of a patent. The original location of the New Years Extension on its southeasterly side overlapped upon the surface of the Providence mine, in the form of a triangle.

In 1884, the owners of the Providence objected to this overlap upon their patented ground, and the result of this objection was that the respondent caused a relocation to be made, by its superintendent, abandoning such portions of the lode and surface ground as were within the patented surface lines of the Providence. The notice of location of the New Years Extension—omitting certain portions—reads as follows: "The Providence lode as patented extends northerly about thirty feet across and beyond the line g, h, and about —— feet southerly beyond the south line a, p, of the surface location. No portion of the surface ground is in dispute. There is no controversy with reference to the Providence lode. The only controversy between the parties is in relation to the "contact" or "back" vein. What portion of this vein in its downward course is complainant entitled to? Which line is the northerly end line of the Providence ground through which the vertical plane is to be drawn downward with reference to the contact vein?

Complainant claims that the line f, g, on the diagram is the northerly line of the Providence with reference to this lode and that this line should be extended to g', and so on indefinitely downward. Respondent claims that the line should be drawn from the point where the lode crosses the southerly line of the New Years Extension, or unnex covering the same ground from r to r', marked on the diagram as the "line claimed by Champion."

The case was argued ingeniously, with much zeal, force and ability upon both sides, and numerous questions of both law and fact were earnestly pressed upon the attention of the Court in favor of the respective contentions. Many of the points thus presented were—as in the Con. Wyoming case—novel and new, and all of them were exceedingly interesting and have received a careful consideration. I shall content myself, however, by stating what is believed to be the proper construction of the Statutes of the United States and announce my conclusion upon the questions involved without attempting to discuss all the legal points advanced by counsel.

As there is no dispute between the parties as to the right of complainant to the Providence lode, it is unnecessary to discuss that question except so far as it may tend to illustrate or explain the principle that is to be applied to his right to the contact vein. The Providence lode was located, as before stated, prior to the act of 1866, under the rules, regulations and customs of the miners in the district where the mining claim is situated. The locators were only required to designate the lode in their notice of location. The lode was the principal thing. The surface ground was a mere incident thereto for the convenient working thereof. The notice of



lode line of this claim, as originally located and which I hereby relocate, is described as follows: Commencing at a point on the northerly bank of Deer creek, which point is 80 feet S. 11 deg. 45 minutes east of the mouth of the New Years tunnel, and running thence along the line of the lode towards the N. E. corner of the Providence mill, about S. 46 deg. 15 minutes east, 300 feet, more or less, to a point and stake on the northerly line of the Providence mine patented, designated as mineral lot No. 40 for the south end of said lode line. * * * And whereas, part of this claim, as originally described and as hereby relocated, conflicts with the rights granted by the letters patent of said Providence mine. * * * Now, therefore, so much of this claim, both for lode and surface ground, as originally designated, conflicted or now conflicts with any portion of the surface or lode claims or rights granted by said patent is and are hereby abandoned. Which portion of this claim so abandoned is described as follows: All that portion of the above described New Years Extension claim for surface and lode, which lies south of the northern boundary of said Providence mine which runs north 43 deg. 10 min. east, across the southeastern corner of this claim."

Numerous maps, diagrams and models were offered by the respective parties. The above diagram is deemed sufficient to illustrate and explain the contention of the respective parties:

The lines a, b, c, d, e, f, g, h, i, k, l, m, n, o, p, represent the lines described in the patent of the Providence. The lode line from z to z' running in a northerly and southerly direction represents the Providence lode described in the patent. This lode is in granite and is called the "granite lode:" its dip is to the east. The lode deliniated on the diagram and marked x x' is a separate and independent lode from the granite, and is called by complainant a "back vein," and by respondent the "contact" vein, between slate and granite walls. This lode is the same as was designated in the Con. Wyoming vs. Champion, as the Ural or "contact" vein. It will be noticed that in its course upon its strike it comes into the New Years claim across the Ural side line—marked Wyoming in the diagram—and passes through the New Years in a southerly direction to the northerly line of the New Years Extension, when it changes its direction to a southerly course and extends through the New Years Extension and across the line f, g, of the Providence surface line and extends through the Providence ground to the point x, as delineated on the diagram. Its direction beyond that point has not been ascertained and is entirely problematical and, as I think, is wholly immaterial. If it continues in the same direction it would cross the line of the Providence between d and f near the point e; but for aught that appears in the evidence it may extend through the Providence ground and cross the line a, p. Its dip—like the Providence—is to the east.

location designated the number of feet that was claimed upon the lode, and the locators were entitled to that number of feet, if allowed by local rules, in whatever direction the lode run, and to all its dips, spurs, angles and variations. The subsequent acts of Congress did not interfere with these rights, but were in all respects confirmatory thereof. The Eureka case, 4 Saw. 323; Wilhelm vs. Sylvester, 35 Pac. Rep. 997.

The act of 1866 provided a method whereby the owners of mining claims, located prior to the passage of the act, who had complied with these local customs, rules and regulations, might, upon certain conditions, receive a patent therefor from the Government of the United States. Parties applying for patents were required, among other things, to "file in the local Land Office a diagram of the same so extended laterally or otherwise as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor," etc., etc. Under the act of 1866, parallelism of end lines was not required, but by the act of 1872 parallelism of end lines is made essential, a survey of the surface ground must be made before it can be patented, and the surface lines of such survey should be marked upon the ground whether patented under the law of 1866 or of 1872. The intent of both acts, in this respect, is substantially to the effect that the mining locations made thereunder should be along the lode lengthwise, and the surface boundaries should be marked upon the claim. It was not intended by either act that the locator would have any right to follow the lode upon its strike beyond the surface lines of his location. The term "location" as used in both acts refers to the surface ground as well as to the vein or lode. The lode claim, whatever its nature, character or extent, is to be limited to the survey of the surface location, and the title to the lode upon its strike is not given to any portion thereof which departs beyond the surface lines of the location.

In Mining Co. vs. Tarhot, 98 U. S. 463, familiarly called the Flagstaff case, the Supreme Court of the United States declared that under the act of 1866, as well as under the act of 1872, the location of a mining claim upon a lode or vein should be made along the same lengthwise of the course of its apex, at or near the surface, and in the course of its opinion said: "The Act of 1872 is more explicit in its terms; but the intent is undoubtedly the same, as it respects end lines and side lines and the right to follow the dip outside of the latter. We think that the intent of both statutes is that mining locations on lodes or veins shall be made thereon lengthwise, in the general direction of such veins or lodes on the surface of the earth where they are discoverable, and that the end lines are to cross the lode and extend perpendicularly downwards, and to be continued in their own direction either way horizontally; and that the right to follow the dip outside of the side lines is based on the hypothesis that the direction of these lines correspond substantially with the course of the lode or vein at its apex on or near the surface." See also Iron M. Co. vs. Elgin M. Co., 118 U. S. 248; The Eureka case, 4 Saw. 323; McCormick vs. Varnes, 2 Utah 355; 9 Mor. M. R. 505.

The patent to the Providence mine was confined to the Providence lode and to the surface ground as surveyed, and marked on the diagram filed in the Land Office. It granted no right to the owners of the Providence to the "back" vein. It was a grant to the Providence lode only and in express terms excluded all others. The effect of the Act of 1872 was to grant to the owners of the Providence surface location all other "veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically in whatever course or direction they might run." In Wilhelm vs. Sylvester, 35 Pac. Rep. 997, the Supreme Court of California in discussing this question, after quoting from Section 2322 of the Revised Statutes, said: "This language is clear and explicit, and, in designating the property rights of locators, is in no wise ambiguous or uncertain. It expressly, and in language which needs no construction, grants to such locators every ledge or lode the top or apex of which lies within the surface lines of the location; that is, such part of the ledge as lies within such lines. And there is no limitation or exception of any such ledge on account of the direction it may run. It may be parallel with the originally discovered ledge, or may approach it at right angles, or at an obtuse angle, or at an acute angle; it may intersect it or not, and still it may be clearly within the language of the said section."

The Act of 1872, in granting all other veins that were within the surface lines of previous locations, did not create any new lines for such veins, nor invest the Court with any authority to make new end lines for such other veins. And it is apparent from an examination of the statute, that the Court has no power to make a new location for every vein that may be found within the surface lines of the location and thereby enlarge the rights of the original locators.

When the end lines of a mining location are once fixed, they bound the extra lateral rights to all the lodes that are thereafter found within the surface lines of the location.

It necessarily follows that the end lines of the Providence survey must be considered by the Court as the end lines of any and all other lodes or veins which lie "inside of such surface lines." Otherwise endless confusion would arise in the construction of the statute. End lines would have to be constructed in different directions if the separate lodes or veins found within the surface lines did not run parallel with each other, and the result would be that these lines extended might give to the owners of the claims a greater length along the lode as it extended downward than they had upon the surface.

If the same end lines which bind the extra lateral rights of the Providence surface survey apply to the contact vein and to all other veins, if any are hereafter found, then no such difficulty can arise. This is the rule that applies to all locations made after the Act of 1872, and it ought not to be presumed that Congress—by its grant to prior locators—intended to give greater rights to them than were given and granted to subsequent locators under the same Act.

It is settled by the decision of the Supreme Court of the United States in Iron S. M. Co. vs. Elgin M. Co. that the same end lines bound all extra lateral rights as to all veins or lodes within the surface boundaries of the claim. Justice Field, in delivering the opinion of the Court, speaking of the rights of locators of mining ground to follow the lode in its depth, said: "It often happens that the top or apex of more than one vein lies within such surface lines, and the veins may have different courses and dips, yet his right to follow them outside of the side lines of the location must be bound by planes drawn vertically through the same end lines. The planes of the end lines cannot be drawn at right angle to the courses of all the veins if they are not identical."

In the present case the end lines of the Providence—a, p, and g, h—are conceded to be substantially parallel with each other, and that the Providence lode in its course lengthwise passes these end lines. Complainant's contention would take the "back" or "contact" vein outside of the plane of the northerly end line of the Providence drawn downward vertically and give to him extra lateral rights not granted by the patent nor given to him by the granting provisions of the Act of 1872.

But, in this connection, it is argued by complainant that respondent is estopped from asserting any claim to any vein or lode lying southerly from the line f, g, because (1) in its relocation of the New Years Extension claim it recognized and designated that line as the "northerly end line of the Providence line," and expressly abandoned all that portion of the original New Years Extension claim "for surface and lode which lies south of the northern boundary line of said Providence mine, which runs north 43 deg. 10 min. east, across the southeastern corner of this claim;" (2) Testimony was offered and admitted against the objection of respondent, tending to show a further estoppel which was to the effect that before the Champion shaft was started the plans therefor were submitted, by the then superintendent, to the Board of Directors of respondent and approved by it, and that the shaft was sunk, in pursuance of such plans, parallel with the line f, g, extended in the direction of g', and that the superintendent had conversations, about that time, with complainant and his brother—a co-owner in the Providence—and stated that he would never interfere with that line and would never cross it, and that this line was practically agreed upon by them at that time as the boundary line between the two claims.

This testimony, giving it full scope and effect, is not sufficient to create an equitable estoppel.

The corporation is not bound by such declarations of its superintendent made without the scope of his agency or authority from the corporation. If respondent was given the line for which it contends it would take that portion of the lode which it expressly abandoned by its relocation. The abandonment, which is binding upon it, was to any and all lodes within the surface boundaries of the Providence location and survey; but this abandonment or agreement—or whatever it may be called—did not give to the Providence any greater rights than it previously had. The acquiescence and agreement between the parties amounted to nothing more than a recognition of both parties that the line f, g, was the boundary line between the two companies.

There is nothing in the facts of this case which gives to complainant any right to extend that line—as a boundary line—any further than to point g, at which point it comes to the line g, h, which, as before stated, is the northerly end line of the Providence surface location, and beyond which, in a vertical line drawn downward, the complainant had no right to any part or portion of the "back" vein either by virtue of the Providence location, patent, Act of 1872, or any agreement or estoppel between the parties. Let a decree be drawn designating the boundary plane fixing the rights of the parties in conformity with the views expressed in this opinion, for a perpetual injunction, and for an accounting, if so desired; each party to pay their own costs.

The Origin of the Gold of Quartz Veins.

By Prof. J. Logan Lobley, F. F. S.

Not more than thirty years ago the hypothesis of the igneous origin of the "vein stuff" of mineral veins was stoutly advocated by eminent geologists, and yet to-day the theory, so far as regards the carthy minerals of a vein, may almost be considered to be obsolete. The gold of quartz veins, however, is still held by many to have been introduced into the interstices of the quartz by igneous action. There are others agaiu who, while admitting the aqueous introduction of the gold into the veins, still maintain the theory of its earlier igneous uprise from the deep interior into the massive rocks containing the veins. Recent observations and discoveries by geologists and chemists have now, however, laid the foundations for a theory which attributes the gold of quartz veins not only to an aqueous conveyance to the veins, but to au aqueous origin also, since it makes the waters of the sea the source of the gold.

The opinion of Sir Roderick Murchison, that auriferous veins were confined to Palæozoic rocks or the neighborhood of igneous eruptions, has been contradicted by the finding of gold-bearing quartz veins in California traversing Cretaceous and Tertiary strata; even in localities where there are no indications of igneous action having taken place either in Cretaceous or Tertiary times. This goes far to displace the igneous hypothesis; but there is a fact of very great significance iu this controversy which seems to have been strangely overlooked by the disputants. It is the remarkable absence of gold from volcanic products.

If gold was originally derived from plutonic sources, it ought to be found among volcanic products which come from the same deep-seated sources, and only differ from plutonic rocks in having been solidified uuder different conditions. But, although a most widely distributed metal, gold is almost if not quite unkuown as a volcanic product. That quartz veins aud metalliferous lodes containing the precious metal occur in some regions that have been subjected to volcauic action is true, but other regions of a still more pronounced volcanic character are non-auriferous. It is, too, a most importaut consideration that in gold-producing volcanic regions, the gold is rather in the veins traversing the non-volcanic rocks than in the volcanic rocks themselves. It may also be asked, why is not gold a usual product of volcanic regions? So far, indeed, from volcanic districts being usually auriferous, the reverse is the case, for the usual nou-association of gold with volcanic products is a conspicuous fact, and a much more remarkable and telling oue than its mere statement suggests, both from the very wide distribution of gold and the richness of volcanic products in mineral species, metallic as well as non-metallic.

The great volcanic island of Iceland is devoid of gold, as are also the eminently volcanic areas of Sicily, the Lipari and Pouza islands, as well as the several extinct volcanic districts of Italy. The great volcanic district of Auvergue in central France, and the volcanic districts of the Eifel and Siebengeberge, in Germany, are all non-auriferous; but we seek for gold with success in the bed of the Rhine that brings detritus from the non-volcanic Alps, and find it *in situ* in the non-volcanic rocks of Schemnitz, in Hungary, and the Abrudbanya, in Transylvania, while the volcanic trachytes of these districts are devoid of the precious metal.

Nor is the absence of gold from volcanic products only uoticeable in the European part of the earth's surface. In the volcanic islands of the Pacific gold is also conspicuous by its absence, but non-volcanic New South Wales and Queensland are richly auriferous; and although there is gold in the volcanic North Island of New Zealand, there is very much more in the nou-volcanic South Island, while that in the North Island is not in volcanic rocks. The gold fields of India are not amongst the volcanic rocks of the Deccan, but on the non-volcanic plains of Mysore, and the great auriferous regions of northern Asia are in the Urals, and central and eastern parts of Siberia, all non-volcanic. Western Africa, too, distant from the volcanic Cameroons, gives to the Gold Coast its auriferous sands, but from the altogether volcanic Canary islands gold is not obtained.

But, eertainly the most striking example of the non-auriferous character of volcanic products has yet to be mentioned. The Vesuvian arca of about 100 square miles has produced by far the greatest variety of minerals of any arca of even a hundred times its extent. These include a number of metallic minerals; but neither gold nor any salt of gold, or auriferous compound or alloy of any kind, has ever been noted, notwithstanding the diligent examination to which Vesuvian products have been subjected by competent observers for a long period of time.

The occurrence of rich aurifcrous detritus beneath masses of lava, both iu California and in Victoria, has no bearing on the question, since these detrital deposits are not derived from the place where they uow are, but from hills at a considerable distance, in which were the auriferous veins long before the outbust of the lavas now covering the beds that have resulted from the erosion of the rocks of which those elevations were formed. Indeed, in view of the wide dissemination of gold in the rocks of every continent, and its absence from so many widely separated volcanic regions, it would seem to be but a fair and reasonable conclusion that the gold of the surface rocks has uot been derived from volcauic sources, and therefore not from the sources of plutonic rocks, and consequently not by igneous action.

The aqueous hypothesis of the occurrence of metallic gold in quartz veins is based on the following considerations: Gold is one of the most insoluble aud unchanging of minerals, whether metallic or non-metallic. It is not oxidized by either air or water, and is not attacked by any of the ordinary acids, much less is it dissolved by water either cold or hot. But it chemically unites with some, though very few, elements, and so forms auric compounds, and these compounds are soluble to a greater or less exteut in water, and it is itself soluble in sclenic acid and also in aqua-regia or nitro-hydrochloric acid under certain conditions. Chlorine is one of the few elements with which gold forms a chemical compound, and this salt of gold, the auric chloride, or the terchloride of gold, is readily dissolved by water at ordinary temperatures. With sulphur a sulphide of gold is formed that is also a soluble salt, though not nearly so much so as is the chloride.

The long-coutinued, unsuccessful efforts to crystallize carbon and alumina, though minute diamonds and rubies were eventually produced, sufficiently show that in Nature's laboratory conditions obtain that can only with the greatest difficulty be produced artificially. It seems probable that, under natural conditions of heat and pressure, gold will unite with silica, forming a silicate of gold slightly soluble iu hot water. Thus the same conditions that favor the solution of silica itself, which, as is well knowu, is slightly soluble in hot water, and the deposition of it iu cavities or fissures would likewise be favorable to the formation of a silicate of gold in siliceous auriferous rocks, and the subsequent solution of the compound and its transportation also from the massive rock into any cavity or fissure. There would thus be an infilling of fissures with silica, together with an admixture of silicate of gold, not to mention other minerals. Time alone would then be required to effect the complete separation of the gold from the silica with which it was united, and leave it as free metallic gold iu the diversified forms and quantities in which it is now found in quartz veins. In support of this view Bischoff, Dr. Sterry Hunt and Prof. Newbery, all high authorities, have expressed the opinion that gold has probably been introduced into veins in the form of silicate.

The problem of the origin of gold, then, seems to be reduced to accounting for its occurrence in sufficient quantity in ordinary marine sedimentary rocks. As all of the materials of these rocks were derived directly from the seas of the globe, it will be necessary to ask, in the first place, could the sea water contain and deposit the gold now imbedded and disseminated iu the rocks of the globe? The question can now be answered very distinctly in the affirmative.

Since the sea is the great receptacle for all solutions, it was safe to conclude that it contained the soluble salts of gold, but the fact is not now a matter of mere deduction, but of actual knowledge. Sonstadt found, from careful experiments on the sea water of Ramsey bay, Isle of Man, that sea water contains a little under a grain of gold per ton. Estimating the whole of the gold production of the world to the preseut time at £8,500,000,000 sterling, and taking the weignt of the sea water of the globe at 560,000,000,000,000,000 tons, as estimated by Prof. Wurtz, of New York, we find that the present seas of the globe contain upward of 5,000,000 times as much gold as has ever been extracted from the rocks; and consequently we must conclude that the seas of the globe in the past have been fully able to stock its mineral deposits with all the gold they contain.

We now arrive at the next stage of the inquiry, which is, how can the gold be separated from its marine solution and be deposited along with the materials of the sands, the shales, the clays and the limestones that constitute the sedimentary rocks?

By the accidental dropping of a picce of cork into a solution of chloride of gold, Mr. Richard Daintree, of the Geological Survey of Victoria, discovered that organic matter causes the decomposition of an auric chloride solution, and the consequent precipitation of metallic gold. During the deposition of the materials of the sedimentary rocks at the bottoms of the Palæozoic and Secondary and Tertiary seas, much organic matter undoubtedly existed on the sea bottom. Some strata are so crowded with the fossilized enduring parts of animal organisms, that they are now actually named, in geological nomenclature, "bone beds" and "shell beds," and we have abundant evidence of the existence, also, through the geological periods, of a great amount of algæ or seaweed.

Assuming, then, that the waters of the seas of the past contained gold by the solutiou of its salts as our present sea water does, the conditions would be quite favorable for the deposition of gold contemporaneously with the accumulation of the ocean bed. The amount of gold thus deposited would, however, necessarily be so exceedingly small in proportiou to the mass in which it was included, as to be almost infinitesimal, and too little, therefore, to be detected in the resulting rocks, unless concentrated by separation from the general mass and accumulation in aggregations conjointly with other metallic mineral matter.

Consequent upon the important discovery of Daintree, Prof. C. Wilkinson carried out a long series of experiments, from which it was evident that gold precipitated by organic matter aggregated around metallic nuclei, aud that besides gold itself, the sulphides of the metals, as pyrites and galeua, were especially attractive. This is in entire accordance with the well-known fact of the association of gold with the metallic sulphides, and particularly with pyrites. When in association with pyrites and other metallic minerals, whether au association of adhesion merely or as an alloy, the gold would remain so associated until induced by the occurrence of new aud favoring conditions to sever itself from its metallic associates, and chemically combine with an element or a compound for which under the conditions to which it was exposed it had affinity, and which body I imagine would be supplied by silica.

From these considerations it seems probable that gold was originally dissolved in the waters of the ocean, from which it was deposited as the result of the decomposition of soluble salts of gold by the action of organic matter, and that it was then eliminated from sedimentary rocks by segregation to other metallic matter with which it remained associated until thermal conditions (caused by deep-seated position or not far distant igneous action) induced a chemical reaction, and likewise heated sufficiently the subterranean water of the rocks to make it an effective solvent of the auriferous compound. So the gold of the massive rocks was carried with silica by percolatiug water into the accumulating "vein stuff" of rock fissures, where, on cooler conditions supervening, the auriferous eompound was deposited in a solid condition, and the gold itself subsequently separated, by the segregation of the silica to the vein quartz, and left disseminated through the vein stuff as metallic gold in the forms in which it is now found.

Selby Smelting and Lead Company,

416 Montgomery Street, San Francisco.

Gold and Silver Refinery

—AND—

Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

Also Manufacturers of

STANDARD SHOT-GUN CARTRIDGES, Under Chamberlin Patent.

John Taylor & Co.

Importers and Dealers in

Assayers' Materials,

Mine and Mill Supplies.

Also Chemicals, and Physical, School and Chemical Apparatus.

63 & 65 First St., Cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C° BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

A Vast Copper Mine.

The magnitude and extensive scale upon which copper mining is carried on in the upper peninsula of Michigan is a matter of astonishment and interest, even to those who are residing in the district, and to the stranger who tarries a few days or weeks it is beyond comprehension, for the reason that he cannot realize how vast in depth and extent are the shafts and levels in so great a mine as the Calumet & Hecla—the famous copper mine of the world.

The conglomerate vein which is being mined by the Calumet & Hecla is made up of water-worn pebbles, boulders and bunches of sand rock, intermixed with which, like a cement as it were, is the pure native copper. No copper ore is found in this district, no matter how microscopically minute the particles of copper may be disseminated. Between the matrix of rock it is pure virgin copper, which, to be made available for the market, has simply to be crushed out and washed out with water to prepare it for the fire that smelts it.

The Calumet & Hecla has a length of two miles of vein running nearly north and south. The veins dip to the west at an angle of about 38 degrees, and therefore the shafts are sunk in that direction and angle. In nearly thirty years of mining the company has attained a depth of nearly 5000 feet, from which the heavily laden skips or cars, drawn by the finest steel wire cable that money can buy, are hoisted to the surface at a speed equal to the locomotives running on a standard railway. The operation of mining has been to sink one level or lift 100 feet deep, then to drift along the vein to the next shaft and then sink again to the next level, and then to break the vein rock down from above, fill it in tramcars which are dumped into the skips that take them to the surface, and this has been going on for thirty years. In the earlier days of the mine, however, very much slower progress was made, for the miner had to strike the sharpened steel drill by blows of a sledgehammer in his hands. The blasting was done by common black gunpowder in coarser grains than those used for firearms, and a horse attached to a whim did the hoisting of the rock to the surface.

To-day a powerful steam engine compresses the atmosphere which is conducted underground in iron pipes. The compressed air is the motive power that works mechanical drills that are pointed with diamonds, and a hole is drilled in a few hours that would have taken several days with the hand drills. Instead of black powder, the drill holes are charged with dynamite, so extremely sudden and terrific in its action that no tamping in is needed to keep it from blowing out, the atmosphere being sufficient to cause it to do execution in the hardest of rock. What was considered nearly a year's work thirty years ago is now done in a month.

There have been made upon the mine location nearly twenty miles of streets between the residences of the employes, but if the drifts and shafts that have been bored out of the solid rock were put in one continuous level, it would be over 100 miles long. The amount of vein rock coming out to the surface is over 400 tons per day. For the accommodation of its employes, 698 dwelling houses were built, and lots leased upon which the employes have built 182 houses. Of mine buildings, such as shaft, rock, engine, carpenter, blacksmith and machine shops, there are over fifty. Of steam engines there are nearly 100, ranging from 4700-horse power to only a few horse power.

Foreign governments have sent representatives to visit and study the plans and methods of operating the large copper mine. The total boiler capacity required is 22,500-horse power. It consumes an enormous quantity of coal, and during the recent strike of the coal miners the mine would have been obliged to close down but for the liberal policy under which the affairs of this company are managed. There was enough coal in its enormous coal shed at Lake Linden to last nearly six months, and it was also successful in getting twenty or more cargoes as soon as navigation opened. All departments of the mine are up to date, and all modern mining appliances that have proved practical are in use. Its machine shop is built of stone, the dimensions being 225x250 feet.

There are forty steam engines doing service at the mine alone, and a dozen more at the stamp mills at Lake Linden. The mine has its rock carried to its stamp mills at Lake Linden, five miles away, by a railroad of its own. The locomotives used are nearly 100 tons in weight, and pull up the hill from Lake Linden, where there is a grade of 700 feet from mill to mine, over 130 empty rock cars. All employes are protected by an accident and sick fund, which pays them at the rate of $25 per month when disabled, and $500 to the heirs of those killed while in the discharge of duty.

The Big Bassick Mine.

The recent incorporation of the Bassick Gold Mining and Milling Co., of Utah and Colorado, which now owns that property, recalls the early days of that famous gold-producer.

The mine was discovered in 1877 by a wandering sailor who had turned prospector. His name was E. C. Bassick. He is now living in Bridgeport, Conn., off a competence he settled on his wife in the palmy days. The Maine was what he named the lode. He was too poor to ride, so he walked to Pueblo, Col., with a chunk of the ore in his kit. This he showed to O. H. P. Baxter, and as Bassick did not even have enough money to pay for an assay, Baxter had it assayed. It was so rich in gold that Bassick started back for his mine in a big hurry, so afraid was he that some one might steal it. The first few tons he sent to the mill returned him $12,000.

Old-timers tell a funny story about Bassick's use of his newly acquired wealth. As sailor and prospector he had lived on salt junk and bacon for many years, and the very sight of fruit was a luxury that was only dreamed of. When he got his first mill returns he posted off to the nearest town and bought up every bit of fresh and canned fruit he could obtain, and had a royal gorge. The tinned fruit he deposited in a specially built cellar, and it lasted him six months. Bassick is a very dignified old gentleman now, and doesn't relish such recitals.

In a year and a half he took out fully $500,000, and in July, 1879, sold the mine, receiving $500,000 and a tenth of the stock of the new company.

Under the new management there was the most extraordinary extravagance, but notwithstanding this it produced $1,679,000 between July, 1879, and the date of its wreck in 1885. Of this sum, however, only $425,000 reached the owners, great amounts being squandered in useless machinery, etc. Mechanics' liens were what closed this great producer. With $138,000 in the treasury in March, 1884, the company was $60,000 in debt within a few months. The holders of the liens did not come in battalions, but singly. First one obtained a judgment and order of sale and then another, till it got to be part of the court proceedings to order sales of the Bassick on liens. E. C. Bassick, through Hugh Butler, made the first purchase, Staples, a Bridgeport banker, and Ryan made more, and this sort of thing was kept up until the summer of 1893, when a sheriff's deed was issued to Ryan, who had settled the taxes and received redemption certificates and tax deed from Custer county.

This but involved a new series of litigation, Bassick and Staples still contesting ownership, and quite recently Judge Hallett gave a decision in favor of Staples and against the company, based on some deal between Bassick and Staples nearly ten years ago, which decision fastens another debt of $60,000 against the company.

Brighter days began for the Bassick last year when ex-Senator Warner Miller and associates, of New York, took a bond and lease on the property and formed the New Bassick Mining Company, capital $5,000,000, in shares of a par value of $5 each. There was a sudden eclipse when the crash came last summer, the New York men abandoned the enterprise, but here the Ryans stepped in and took active control with the result of the organization of an entirely new company, the one just incorporated.

Professional Cards.

WM. GILBERT, B. S., Manager.
PRACTICAL ENGINEERING SCHOOL,
205 Goodnough Bld'g, Portland, Or.
Civil, Electrical, Steam, Mining, Assaying.
Full charge of plant taught. Circular.

F. ORTON, Mechanical Engineer.
EXPERT DESIGNER of Special and General Machinery.
PREPARING PLANS of Steam, Air and Hydraulic Apparatus; Iron and Wood-Cutting Machines; Transmission of Power, Etc.
218 Mission St., San Francisco.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—GOLD AND SILVER ORES.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Cruelble Assay; Preliminary Assay; Dressing the Cruelble Assays; Examples of Dressing; The Melting in Cruelbles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.
Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.
Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

TUBBS CORDAGE CO.
(A CORPORATION.)
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. Extra sizes and lengths made to order on short notice.
611 and 613 FRONT ST., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ABOUT THE GOVER.— *Ledger:* When tbe Utica people abaudoned their proposition to take the Gover mine and operate it, everybody interested in the property either as owners, mortgagees, attorneys, attaching creditors or lien holders, turned their attentiou to the matter of getting the mine in operation while it was still in the hauds of the sheriff and before it was allowed to fill with water.

The result was that an agreement has been drawn up and signed by nearly all the interested parties to the effect tbat the Gover Company will execute a second mortgage upon the property for an amount sufficieut to cover all claims against the company, the mortgage not to be foreclosed for three years from Sept. 1, 1894. The attachments are all to be withdrawn and the company to resume work immediately upon the execution of the agreement.

The lien holders are to prosecute their liens to judgment, hut are not to take execution thereon uutil three years have elapsed. The disposal of the money resulting from the cleanups made by the sheriff, after that officer's expenses have been paid, is to be left to the Superior Court. It will be remembered that the Gover mine was shut down some months ago by a number of attaching creditors, who were paid in time checks which the company was not able to honor. Since that time it has been in the hands of the sheriff, with instructions from the Superior Court to keep the water out, aud that has been done. There is a mortgage of $15,000 upon the property, held by the Anglo-California Bank of Sau Francisco.

Butte.

FORBESTEWN MINING NOTES. — *New Era:* There are several tons of sulphurets at the Denver mill to be worked at the Shakespeare Reduction Works.

Price and Blair intend starting up the Johnson mine. This property is situated near Hansonville aud has a ten-stamp mill on it, and the ore is of high grade but rebellious. There has been several attempts to make this mine pay, but all have failed.

The tunnel now being run by the Gold Bank mine will be 1200 feet in length aud tap the ledge at 1000 feet. Tbe present shaft will be connected to the tunnel by a 700-foot raise. When the tunnel is completed, the mill will be moved and au addition of forty stamps will be made.

Calaveras.

MINE BONDED. — *Prospect:* Tbe Parnell mine at Smith's Flat has been bonded to R. Montenegro, and work will be commenced at once. A ten-stamp mill will be put up on the mine, and the work of crusbing rock will soon be in progress.

Inyo.

NEW FINDS ON THE DESERT.—Dr. J. A. Mack and E. B. Waite of Redlands have just returned from the Panamint country, where the Redlands Gold Mining Company have some very valuable property, upon which they are erecting a mill, says the San Bernardino *Times-Index*. These gentlemen are not interested in that enterprise, but have been prospecting about six miles this side and have made twenty-two locations within a radius of twelve miles. On the Yolanda, at a depth of fifty feet on an incline, they have a ledge twelve feet wide and have seventy-five tons of ore on the dump. The formation is a shale and talcose slate, which is very favorable for gold. The ore is a honey-combed iron quartz and shows considerable free gold, besides sulphurets. Assays as high as $1200 in gold have been obtained. They also have locations that show galena in quartz running three and one-half ounces in gold. Tbese claims are located about four miles north of the county line in Inyo county. They brought in a large number of specimens from these properties that by their appearance indicate their value.

The only drawback to the country in which these properties are located is the great distance from the railroad—it is over 100 miles north of Daggett—and the scarcity of wood and water; but with rich ore and plenty of it, such difficulties can be overcome.

Nevada.

PROVIDENCE MINE.—*Transcript:* The Providence mine has always been regarded as one of the most reliable gold-quartz mines in this district. The property is in splendid working condition. An immense amount of rock is being taken out, sufficieno to keep thirty stamps in operation night and day. The ledge from which the rock comes is fully eight feet thick and all of it is of a very fine quality. There is enough ore in sight to keep the mill running for a very long time. The company has also a very large track of virgin ground which will take many years to work out. The prospects there were never more flattering than now. There are eighty miners employed in the mine, besides other help.

THE SOUTH IDAHO.—*Transcript:* Another rich strike has been made at the South Idaho mine in the south drift. The ledge is large and the rock taken out contains considerable free gold. This mine is located south of the famous old Idaho.

Shasta.

Courier: At the Niagara mine there are twenty-five men now on lease work. Tbere is a great deal of work being done ou all the mines in that vicinity all the way from French Gulch to Deadwood. At the Gulch a good many of the boys are waiting for the Gladstone to resume operatious, although a large number of them are at work either in neighboring mines or else prospecting and opening new mines for themselves. At Whiskytown and vicinity there is also quite a stir in the different mines, several mine-owners and prospectors being there.

CRUDE METHODS. — The following pointed criticism is from the Yreka *Journal:* The quartz and placer mines of this county, if worked with the improved methods of the central sections of California, would pay much better than at present. Quartz ledges in most sections below pay expenses of milling at $2.50 to $2.75 per ton, but such grade of quartz would uever pay here, in fact would entail a heavy loss on operators under present mode of working. With good and improved machinery of the newest invention, there is hardly a single ledge in this county that would not yield profitable returns.

Even the noted Black Bear mine at Salmon river, supposed to be worked on a scientific scale, is very poorly equipped. The stamps of the mill have only four foot plates in front of each four stamps, with no plate sluices extending out to catch the gold, not even blankets or concentrators to secure a large portion of the dust escaping with the tailings. Neither has any effort been made to save the tailings, which if scientifically treated would yield largely.

The blue gravel mine at Greenhorn could also be worked on a better basis than at present, by running a six-foot tunnel up the channel, and making crosscuts, instead of running several branch tunnels, in which a man cannot stand up straigbt. A single large tunnel, with rails for hauling large cars to the shaft by steam, would be a great improvement, as on taking out the gravel from each crosscut it could be filled up again with the boulders, or timbered if there are no boulders in the gravel taken out.

Our river claims could be worked more successfully by the use of a donkey engine, to do all the hoisting and pumping to better advantage than the clumsy and unwieldy current wheels, and no doubt many new methods could be introduced with profit in the placer and drift diggings throughout this county, which is recognized as a vast region of rich mineral deposits.

MINING NOTES. — *Journal:* Austin & Co. have struck rich blue gravel again at Greenhorn, but owing to scarcity of water are working a small force. They are making preparations also to be in readiness for the rainy season when winter is at hand, by raising a new shaft from the end of their present tunnel, with steam blowers to supply fresh air. The new shaft will probably be completed to the surface in about two weeks, at wbich time the steam plant, pumping machiuery, hoisting apparatus, etc., will be removed. With tbis new shaft completed, the blue gravel at the upper end of tunnel cau be hoisted out with greater ease, besides proving safer from the danger of foul air in working long distances from the main shaft to the surface, 100 feet or more above.

The Elliott creek district on Siskiyou mountain, near the Oregon boundary, is loomiug up as a rich mining district, and many rich placer claims have been located.

At Horse Creek, Klamath river, the rich high-bar diggings, which prospected so haudsomely with the old-fashioned rocker, are to be worked on an extensive scale as soon as the new ditch now under construction is finisbed, to supply water for sluicing.

The river miners iu the Oak Bar section are getting down in their claims, and will soon be taking out considerable gold dust.

Tuolumne.

MINING NOTES.—*Independent:* The Dutch Mine—This mine is keeping the water out of the shaft preparatory to commencing active operatious.

The Sweeny Mine—This mine adjoins the Dutch to the north. Men are employed timbering up the shaft and putting things in shape for work.

The App is steadily working. They have crosscut a twenty-six foot vein, which looks well.

The Miller and Holmes—They have erected a two horse whim and are busily cross-cutting and exploring their mine at 200 feet deep, with very encouraging results.

The Golden Rule—This mine has erected a five-stamp mill and are crushing good payable rock.

The Webster Mine—This mine has recently changed hands, for a large figure. This is a very valuable property. It is sold, it is said, to an English company.

The Stanley-Kanaka Consolidated mines were visited by mining men the past week, who were well pleased with the outlook. This property contains a vast deposit of low grade ore, which needs a powerful crushing plant; driven by water power would be a grand success.

The Rawhide—This splendid property is running twenty stamps on their usual rich ore. Tbe company are about to erect a complete chlorination plant, to reduce and treat their sulphurets, which are of usual high grade, from the mother lode. This mine has quite a village of its own, within its enclosure.

The Rappahannock—This company are busily engaged in putting up a five stamp hoist. The engine and boiler are already iu place The Poppet heads will soon be erected, then the whole will be covered in by an extensive building, with every suitable convenience for steady sinking. Cornish pumps, will be used to handle the water. This property starts under very good auspices. The rock shows free gold, and an assay of the sulphurets gave $1100 to the ton.

The Isabella and Gem—Several experts have been visiting this property, the past week, with purchasing intent.

The Harris aud Oliver—Mr. Dawson has been actively prospecting this mine with the view of purchase.

The Gem mine is steadily keeping the ten-stamp mill pounding away on good payable ore. The miue was visited, last week, by a would-be purchaser, but foolishly the owner has tied it up, (as it appears), almost indefinitely, possibly, to their sorrow. No mine owner should bond his mine, unless a good deposit of cash to show good faith is put up.

NEVADA.

Washoe District.

The faces of the ore body ou the 1650 level of Con. Cal. Virginia continue to look well. Have extracted during the week 350 carloads of ore—about 347 tons—the average assay value of which, per mine car samples, was $61.58 per ton. On the 1700 level, twenty-two feet below the south drift No. 3, the work of timbering iu the south drift has been completed, and this south drift has beeu extended teu feet, all the way in ore which will average $60 per ton; total length of drift, 46 feet; face in ore, the average assay value of which is $72 per ton.

A northeast drift started at a point on the 1000 level, 30 feet in from the mouth of the crosscut run east from the bottom of the winze—down 28 feet—which was sunk on the east side of tbe main drift, 280 feet south from the shaft station, has been advanced 33 feet; face in porphyry, clay and quartz. The west crosscut started from the main drift, 345 feet from the shaft station, has been advanced 25 feet; total length, 185 feet; continuing in porphyry aud quartz formation of low value. Some repairs have been made in the main drift. The Con. Virginia shaft from the 1300 station down to the 1500 station has been secured and water pipe bas been put in place, and are now continuing the same work upward from the 1300 statiou. Have shipped to the Morgan mill during tbe week 651 tons and 700 pouuds of ore, the average assay value of which, per railroad car samples, was $65.26 per ton. The average assay value, per battery samples, of all the ore worked at that mill during the week—660 tons—was $53 per ton. Bullion uow on hand iu assay office—assay value about $13,000. Bullion shipped to tbe Carson mint—assay value, $35,767.94.

The upraise on the 1465 level of Ophir, 70 feet in from the mouth of the east crosscut, has been carried up fourteen feet in porphyry, clay and quartz. Tbe face crosscut running east from the uorthwest drift from the Mexican shaft in tbe central tuunel is in porpbyry, clay and quartz showing some value. The west crosscut in Mexican on tbe 1465 level from the top of the upraise is in porphyry showing fine lines of quartz. The Union Con. and Sierra Nevada joint uorth drift is in bard porphyry. A west crosscut at the top of the north drift on the 200 level of Best & Beleber is in quartz and porphyry. The face of the south drift on tbe 200 level of Gould & Curry is in soft porphyry.

From the several openings above the 400 level of Occideutal have extracted about fifteeu tous of ore of tbe average assay value of $34 per tou. The west crosscut started near No. 3 upraise on 500 level is now in 92 feet; face in hard porphyry.

Kennedy District.

A bonanza has been opeued in the Paymaster miue in Water canyon, Kennedy district. Weduesday last the workmen uncovered a two-foot vein of rich sulpburets.

The Hidden Treasure miue at Kennedy is proving itself to be oue of the best mining properties in that district. For 1200 feet on the surface the ledge has been traced. A tuuuel has beeu run seventy-five feet near the center of the claim, intersecting the vein. At this point the ledge is about two feet wide, carrying eight to twelve inches of rich ore, from which sixteen tons were shipped, without selecting or assorting, giving $104 in gold and oue ounce in silver to the ton.

LINCOLN COUNTY.—Several gold districts have come into existeuce within the past two or three months, the youngest being that located in the Cedar basin, some twenty-three miles northeast of St. Thomas, Nev. The basiu forms the northeast corner of a triangle with St. Thomas and Bonellie's Ferry on the Colorado as the other two points. The developmental work which has been done there plainly shows that it is a very rich gold district, aud the indications are that within a comparatively short time it will be numbered in the ranks of the producers of the yellow metal.

NYE COUNTY—CRESCENT DISTRICT.—*Record:* H. Elridge and J. E. Langford, of Salt Lake City, are on their way to Crescent district, Nye county, Nev., for the purpose of putting up a ten-stamp gold mill of the Gilpin type, and also a saw mill in Timber mountain. They have purchased some twelve claims outright, the well-known Mackay claims being of the number. The ten-stamp mill and also the saw mill, together with four miles of piping for the purpose of piping the water to the mill, and some 12,000 pounds of supplies, etc., left Milford by freight teams on the 13th of this month, and will go by way of Hiko and Indian Creek. The ore is of an easy character to work and goes enough in gold to make the workiug of it very profitable. Negotiations looking toward the sale of the above properties have been in progress for the last four years, but, on account of its remoteness from any market, were unsuccessful until Messrs. Eldridge and Langford last winter visited the section and immediately were well pleased with the outlook, and first took a bond and subsequently purchased them outright. The amount that was paid we are at present unable to learn.

ARIZONA.

HYDROMAGNESITE.—Messrs. Williams and Dubois, Yavapai county, have recently discovered magnesia, known in its crude state as hydromagnesite. A thirty-pound sample will be sent to Keasbey & Madison, Ambler, Penn., who are refiners of magnesia, to determine its commercial value. The croppings indicate a blanket, stratified structure in a basalt formation. Its specific gravity is about 100 eubic feet to the ton. It is of a white, creamy color, soft, light and powdering to the touch, very much like flour. with no perceptible grit, taste or odor. There are a hundred tons in sight; the ground overlying the deposit is a soft, light soil that can be removed witb a scraper.

GENERAL MINING NOTES.—Prescott *Journal Miner:* Parties will shortly put up a quartz mill on the Hassayampa at or uear the site of the old Sterling mill.

Over one hundred tons of ore were worked at the Kingman samplers this week, the total value of which is away over $30,000. This is a much better showing than any other miuing camp in Arizona can make tbese dull times.

A report comes from the Gladiator that the work of crosscutting the ledge has been finished and that a body of rich ore has been reached. This latest strike is said to definitely settle any doubt tbat bas heretofore existed over the mine, the character of the ore and size of the ledge being such as to give the mine prominence in tbe mineral world.

COLORADO.

MONARCH DISTRICT.—INDEPENDENCE GULCH: One of the richest strikes ever made in the Monarch district says a Salida dispatch is that reported in the property of the Grout Mining company iu Independence gulch. The workiugs are on a contract between granite and porhyry and consists of a tuunel on the vein about 115 feet in length. The last twelve feet have been showing a fine body of heavy lead ore rich in silver and carrying a good quantity of gold. The lead contents being from 50 to 60 per cent, and the gold and silver bringing its value up so that it will yield a very handsome profit. Beginning with a few inches the ore body wideued to three and one-half feet and gives promise of being a very strong and well defined ore.

THE LEASING SYSTEM—*Mining Industry:* Reports from the mining districts of the State show that an uuusally large number of persons are working properties under lease. Indeed at Aspen the number of lessees almost equals the number of workers for wages, and the making of leases is a thing of almost daily occurrence in other camps. This is one of the very natural results of the depression in silver mining. Many of those thrown out of emplcyment by the elosing of miues and mills, bave but scarce means to carry them through an indefinite period of idleness, and have families dependent upon them for support. They must in some way make somethiug of an income. Therefore as a sole and last resort, they undertake to work ou lease properties which do not promise profits sufficient to satisfy corporations or individual owners of means. They do not expect to make fortunes or perhaps to realize any considerable profits. But they do hope to dig out enough to enable themselves and their families to live.

BRITISH COLUMBIA.

MINING NOTES.—The Kootenay Hydraulic Mining Company is again on a firm footing.

The Nelson Hydraulic Company, after spending $15,000, is about ready to turn ou the water.

The Utica, Alice and Rocky Boulder, on Twelve Mile creek, a branch of Kaslo river, have been bouded for $20,000.

About seventy-five men are workiug on the Cariboo creek diggings. Lumber is being packed up at $50 a thousand. One cleanup of an ounce a day is reported and bedrock had not been reacbed.

Four prospectors have discovered a very large body of low grade gold ore near Nelson on Kootenay lake. Itruns $10 to the ton and is free milling.

A mining engineer of Goldeu has been reporting on the seventeen claims the Calgary Company propose working on Cariboo creek. It looks as though there would be considerable deep digging to reach bedrock in some places, as the formation is cuppy and syenitic.

Boundary Creek District.

"Between 350 and 400 miners are at work in the Boundary Creek district," says H. P. Palmerston, manager for the Midway Company. "We never hear any talk of hard times in our country. There is not an idle man to be met with in a week's travel and everybody is contented. Laborers get $2.50 a day, miners $3.50 and carpenters $3.50 to $4. I don't mean that there is such a demand for help as to justify a stampede. We make a rule not to employ the nomadic element, but no one who comes with an honest purpose to establish his home with us is required to go begging for employment."

The Boundary Creek district lies beyond the British Columbia line.

The provincial government is making a new wagon road from Midway across the mountain to July creek, designed to furhish an outlet for the Copper, Deadwood, Greenwood, Providence, Skylark and Wellington camps. About eighty men are employed on this work. The provincial legislature recently appropriated $20,000 for the road, and this with $8000 left over from last year gives $28,000 available.

The ores of the Boundary Creek district are largely copper and lead and the ore bodies are enormous. The Skylark, owned by the Spokane and Great Northern Mining Company, is shipping two carloads a month. It is high-grade silver ore, carrying about two ounces of gold to the ton.

The Great Hopes property, owned by Crowder, Cornthwaite and McMartin, has been operating an arrastra with good results.

Patton and White are opening up the Ironsides in Greenwood camp. They bave a ledge 150 feet wide of gold and copper ore.

Tbe Snowshoe ledge, in tbe same camp, is sixty feet wide. Denzler, Gibbs and McDonald, the owners, have a force of men at work developing it.

Only assessment work has been done this year on the properties in the Copper camp. The Copper mine is bonded to W. T. Thompson of Fairview, B. C., and eastern associates

for $80,000. It has an undercrop of sixty feet. Forty feet of this is red oxide, carrying eighteen per cent copper.

Some development work is going on in the Deadwood camp, particularly on the mother lode and Sunset.

The St. Lawrence, in White's camp, was recently sold by C. C. Sands to Mr. Colby of Spokane.

WASHINGTON.

OPALS AND GOLD.—The Keith brothers from Duchesne plains on the Salmon river, near its confluence with the Snake, are in Spokane with a large number of opals taken from the mines recently discovered there. These mines are attracting opal hunters, and already a large number of claims have been staked out. A nugget of gold was panned out recently weighing nine ounces. This has caused a big influx of placer miners to that section of Idaho.

NEW CAPITAL FOR OKANOGAN.—M. G. Barney has returned from the Okanogan mining region, where he chaperoned C. Schaer of Chicago, J. T. Klick of St. Louis and Peter Berg of Warsaw, Wis. Mr. Schaer represents several other eastern capitalists who recently bought of Messrs. Barney and Rush a half interest in the Oro group of Palmer mountain. The owners intend putting on a force of men at once to develop the property.

Messrs. Klick and Berg are heavy stockholders in the Rush Mining Company, of which Mr. Berg is now the resident manager. There are 15 men at work, with excellent results. The new machinery is on the ground, ready to be set up. They have a six-stamp mill with concentrator attachment. Mr. Berg is an experienced miner and is highly pleased with the outlook in the Okanogan gold camps.

REPORTED STRIKE IN THE IDAHO.—A new lead has been struck in the Idaho mine in the Solcan country. Fabulous stories are circulated as to the extent of the strike, but no definite information was to be obtained except that the valuation of the property has increased fully a quarter of a million since the new discovery.

IDAHO.

COEUR D'ALENES—AN AGREEMENT REACHED. The following is the agreement entered into by the mining companies of the Coeur d'Alenes and the miners' union, as published in the Murray *Sun*:

This agreement, made and entered into at Wallace, Idaho, this 30th day of July, 1894, by and between the Milwaukee Mining Co., the Standard Mining Co., and the Coeur d'Alene Mining and Concentrating Co., parties of the first part, and the Central Executive Miners' Union of the Coeur d'Alenes, by Edward Boyce, its president, parties of the second part, Witnesseth: For the purpose of settling the difference existing between the parties of the first part and the parties of the second part, the following agreement has been entered into:

The present maximum wages of $3.50 per day shall be paid to all undergrouud men.

There shall be no discrimination in the employment of men; the men now in the country shall have the preference. No men shall be imported for the purpose of working in the mines.

The men who lately left the employment of the company, who were objected to, shall not again have employment in any of the above mines.

It is hereby agreed by both parties hereto, that should any differences arise between the parties hereto, that the same shall be settled by arbitration.

It is the desire of both the above parties that the long-existing differences be and are hereby buried for all time; that henceforth both parties be friends and work for the mutual benefit of both parties.

Coeur d'Alene *Miner:* The Gem mine is now running smoothly with its full complement of miners.

The Bunker Hill Company has been dropping off some of the contractors and is doing the same work under day's pay. There are 260 men at work at the mine and in the shops, tramways, etc., around it, those at work in the mill bringing up the number to about 300 in the employ of the company. The pay rolls last month amounted to $38,000. All work beneath the level of the Reed tunnel has ceased for the present.

The Poorman is again in full blast, with about 175 men at work. Burke has, consequently, resumed its old-time activity.

MONTANA.

THREE MEN DROWNED.—While stoping the 300 and 400-foot levels in the Glengarry mine, near Butte, last Tuesday, the miners broke through and into the old workings of the Ground Squirrel and Monitor, two adjoining mines which have not been worked for some time and had filled with water. The water in an instant filled the workings from the 400 to the 200-foot level. Nearly all the men succeeded in climbing to points of safety on the upper levels, but at least three men are known to have been caught, and it is feared that the number will be increased after investigation. Those known to be in the mine and drowned are Michael Brady, aged 30; James Morgan, aged 26, and Joseph Curry, aged 24, all single men. The bodies cannot be recovered for many days, as the water in the flooded mine is still rising rapidly, and it will be necessary to pump it all out before the dead men can be reached.

Articles of incorporation have been filed in Jefferson county of the Phœnix Mining and Development Company. The incorporators are James L. Buskett, D. B. Vincent, Oscar S. Heyer, A. J. McLean and John Nelson. The office is at Basin. The capital stock is 500,000 shares, at a par value of $1 each.

At Winston the machinery for the underground hoist of the Custer Mining Syndicate has arrived and all necessary arrangements made for the reception of the hoist in the 400-foot level of the Aguafrio mine. The force has been increased, numbering 125 men. The Free Coinage is a silver proposition, and at the present price of the white metal cannot be profitably worked, but the owners are stayers and for eight months have been piling ore on the dump to await a change in prices.

MEXICO.

ALTAR DISTRICT.—Rock has been taken out of a mine at Cueva Santa which assays $200 a ton. These mines are in what is called the El Altar mining district in the northern part of Sonora, something like 100 miles below the American line and fifty miles from the Sonora railroad. There are also rich placer diggings there which give employment to over 2000 Indians, who extract the gold by means of dry washers. The latter make as high as $5 and $6 a day. It is very difficult to obtain a foothold there by any one not now in possession of a claim. Everything seems to be in the hands of the State officers, and, unless they are properly appointed, it is impossible to get possession of anything.

AUSTRALIA.

A BIG GOLD STORY.—*Town and Country Journal:* Reports have reached Perth of an enormously rich find of gold about 10 miles southwest of Coolgardie. The reef from the mine, which is called the Londonderry, was discovered some time ago by a party of prospectors; but its discovery was kept secret until very recently by the owners, Messrs. Jobu Mills, John Huxley, William Gardiner, Henry Dawson, Toomas Elliott, and Peter Carter, in one day banked up 4280 oz. of gold dollied out of less than two tons of quartz, and they have in their cump fully another 2000 oz. of gold in specimens. The claim is so rich that the proprietors, by dollying, have turned out gold at the rate of 1000 oz. every three days. At present the mine has not been nearly developed. The excavation from which £25,000 worth of gold has already been dollied is very small. Several claims have been pegged out in the vicinity of the new find. The Premier, Sir John Forrest, has been interviewed by the mine owners and other persons with regard to the influx of Afghans at Coolgardie. He stated that he would take steps to prevent these aliens getting possession of the claims and competing with European labor. If necessary he would introduce fresh legislation to make the gold fields the possession of the British. Regarding the extraordinarily rich reef which has been discovered at a lease 12 or 13 miles southwest Bayleys, known as Londonderry, 5000oz. which were obtained from there are already on view in the strong room. An escort is bringing more gold to-day. One boulder is more than a man can lift. The reef is about 4ft. 6in. wide and is one mass of gold. The mine is pronounced by Mr. Beaglehole and other experts to be considerably richer than Bayley's; there is no alluvial. Great excitement prevails here as it is undoubtedly the finest show the world has ever seen. The reading of this news from Coolgardie created tremendous excitement at Perth, and a rush is likely to set in.

Latest accounts of the rich find at Londonderry state that the gold is contained in a quartz reef, and the show is better than anything ever seen in Bayley's Reward. The mine is marvellously rich in coarse wiry gold, and the metal is so thickly scattered through the stone that after the rock is fractured it has to be wrenched apart. The workings consist of a trench outcutting across a reef measuring 5 ft. long by 2 ft. wide and 3 ft. deep, and a shaft 40 ft. deep sunk away from the reef cutting; 4000 oz. of gold were dollied in four or five weeks, while the specimens, measuring a foot square, are so heavy that one cannot lift them. One splendid block equal to a 9 in. cube in size is so rich that Mr. Elliot, one of the party, paid his mates £2000 for their share in it. 760 oz. were brought in to Coolgardie by a party of three men, who dollied it in a few months near Hannan's. The heaviest gold escort which has ever left Coolgardie will start for Perth in a few days. Gold is accumulating rapidly in the banks, but it is impossible to dispatch the escort this week, owing to the police being absent at the polling booths.

Anti-Debris Committee.

There was a meeting late yesterday afternoon of the Executive Committee of the State Anti-Debris Association.

W. T. Phipps, the manager, submitted his monthly report, showing the operations of the watchmen for the past month.

A communication was read from the United States Debris Commissiou in relation to certain complaints made to the Commission by the Association.

George Ohleyer, of the Legislative Association, reported having taken steps toward refuting certain false assertions made by the mining press.

The Executive Committee instructed the attorney for the Association, Robert T. Devlin, to commence legal proceedings against a certain miner reported as operating contrary to law and to the injury of the rivers.

The Committee agreed that illicit hydraulic mining is now under control, and that the condition of the river is improved.

An adjournment was taken to the third Tuesday in September.—Sacramento Bee, Aug. 22.

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

RUPTURE!

It has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekl He guarantees every case he treats, and es not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

NOTICE OF ASSESSMENT.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, Cal.; location of works, Virginia, Storey county, Nev.

Notice is hereby given that at a meeting of the board of directors, held on the 27th day of July, 1894, an assessment, No. 74, of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, room 69, Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of August, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 21st day of September, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the board of directors.

ALFRED K. HURBROW, Secretary.

Office—Room 69, Nevada block, 309 Montgomery street, San Francisco, Cal.

THE RUSSELL PROCESS CO.,

Park City, Utah.

J. F. CROSETT,

Commission Mine Broker,

628 SACRAMENTO STREET.

I have five customers looking for income-paying mines for London, to be valued from $300,000 to $5,000,000. I also want ten income-paying properties for customers residing in San Francisco, Chicago, Denver, New York and Philadelphia. Owners of mines desiring to sell can make quick sales by seeing or writing me. I also invite investors to consider properties I have to offer.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER,

26 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

LIGHTNING LARGEST WELL MACHINERY Works.

All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."

SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.

First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE.....Grass Valley, Nevada County, California.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.

Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer.*

Scientific Progress.

Testing the Dryness of Steam.

At a meeting of the Institution of Engineers and Shipbuilders in Scotland a method of testing the amount of moisture in steam was explained. The principle, which is more particularly applicable to marine engiues, consists in comparing the saltuess of tbe steam with that of the water in the boiler. The test is carried out by means of nitrate of silver, and the reaction is so delicate that witb only one per cent of sâlt in the boiler one per cent of priming water can be accurately determined to the second decimal. The process is as follows: To one part of salt boiler water there is added 100 parts of pure condensed water, and into this there is poured a small quantity of concentrated solution of yellow chromate of potash. Then a nitrate of of silver solution contaiuing about one-tenth per ceut of this salt is slowly added. With each drop the water turns locally orange red, but tbis color disappears at first; later on, when all the salt bas been acted on, the whole fluid cbanges color from pale yellow to orange. Tbe quantity of nitrate solution is noted, and then the experiment is repeated on the condensed steam from tbe engine, undiluted with distilled water. Tbe ratio of the quantities of nitrate of silver solution used in the two tests expressess the amount of priming in per cent.

THE experiment has recently been tried with towboats in Britisb waters of driving three screw-propellers with two triple-expansion engines. Tbe central screw is turned by the two low-pressure cylinders, and the side screws by the high and intermediate cylinders of the different engines. Thus the steam takeu at 160 pounds pressure enters the high-pressure cylinder on each of the side shafts, exhausting into its own intermediate ou the same sbaft, then into the low-pressure cylinders of the central shaft.

ELECTRIC WELDING has been used to remedy blowholes in defective castings by first drilling or chipping out the defects and then heating tbe casting around the blowhole in a gas or oil flame blast. Scraps of steel are then introduced, and the electric welding is applied to melt them. The result is said to be a perfect joint, without seam or flaw of any kind.

A CINCINNATI CHEMIST is reported to bave invented an artificial milk composed of water, solids aud fat. This artificial milk will raise a cream from which first-class butter can be churned. It will also turn sour aud is capable of being made into cbeese. The inventor will next, it is presumed, turn his attention to the invention of an artificial cow.

"OZONINE" is the name given by a German chemist to a new bleaching agent, composed of 125 parts of resin, 200 oil of turpentine, 90 peroxide of hydrogen, 40 water and 2.25 potassium hydrate. These combine at first in the form of a jelly, but this liquefies after a few days.

EXPERTS are puzzling over the term "magnetic sbells," used in reports of the armor tests at Okhta, by the Russian authorities, and interpret it as meaning that tbe point or cap is held on to the rest of the projectile by magnetic attraction.

STEEL, instead of copper, is being used as a material for fire-boxes in Austria, and is not, as was supposed, a purely American expedient. Before being bolted into place the plates are freshly heated and cooled to eliminate any brittleness.

ACCORDING to tbe *Echo des Mines*, a new explosive has been accidentally discovered in an unexpected quarter by M. Rossel, a French cbemist, who found that a mixture of aluminum filings and sodium dioxide took fire witb explosive violence when in contact with a little moisture. The preparation of tbe explosive is very dangerous, as, when it takes fire, fiercely burning particles are projected in all directions, the heat bciug great euough to fuse copper wire.

How Gas Companies Work the Public.

Among the papers read before the Western Gas Association at its recent meeting was one by Mr. Wilkiemyer upon "The Best Method of Introducing Gas Stoves." In the discussion which followed Mr. Evans told how bis company worked the subject as follows:

We adopted rather a novel method of introducing gas stoves, by distributing circulars to every family on tbe line of our street mains, offering to give them a gas range free. Of course the object of this circular was to bring possible consumers to the office, where we could explain what we meant by it. Of course we had a "string" to the offer. Our explanation was simply this: If tbe consumer would pay for $20 worth of gas in advance we would give him a $25 gas range, or, rather, a gas range be could not purchase for less tban $25 at retail. Of course they could not understaud such au offer. Our explanation was tbat by the use of $20 worth of gas, baving acquired the knowledge of bow to use gas properly, they would become permanent consumers. Of course the facts were simply tbese: Tbey paid for tbe gas in advance; we had the money to buy tbe stoves with; we made a profit on that $20 worth of gas sold which was nearly enough to pay for tbe stove (laughter); and we got a permanent consumer. Perbaps I will modify that a little by saying that it does not cost any more to distribute 200,000 feet of gas than it does to distribute 100,000 cubic feet. In figuring on the cost of gas, in that deal especially, we figured on the cost of gas in the holder; aud our profits accrued on tbe margin beyond that. As a matter of fact it did bring us in immediate business. On that plan we put out 1500 gas ranges within three months; and those gas ranges brought us in a consumption of 150,000 feet per day; and as a matter of fact we made $9.40 per thousand profit (laughter)—I mean $9.40 worth of profit on each $20 worth of gas sold; and between tbat and what the gas ranges cost us was certainly an advertisement tbat paid us to adopt that system.

An Improved Alloy.

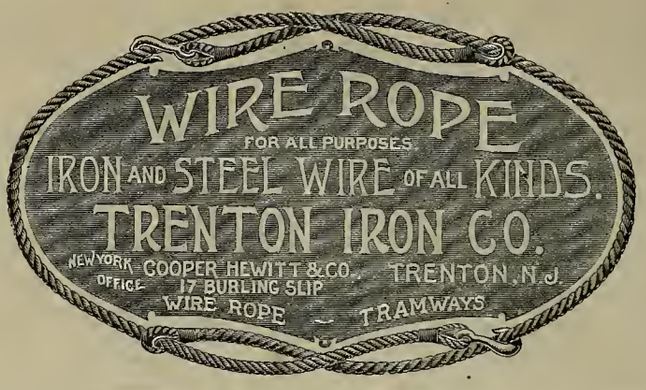
Fifty parts of copper, forty parts of zinc and aluminum in tbe proportion of two and a balf per cent of the wbole are taken. This is one example, but others may be obtained by varying the amounts of copper and zinc to the same proportion of aluminum.

The mode of preparation of the alloy varies: For a bard metal, the copper and aluminum are first mixed to form a copper alloy and the zinc added in small pieces during continuous agitatiou of the molten mass.

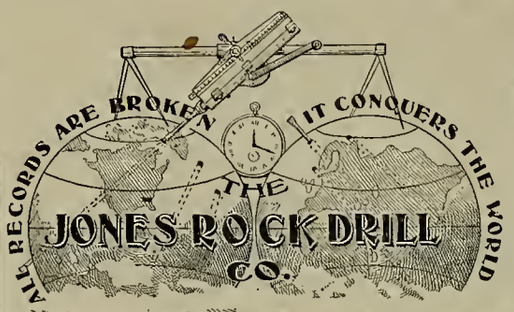
This gives a reddisb alloy that takes a higb polish. For a ductile metal the zinc and aluminum are first mixed and the copper then added. Tbis gives an alloy resembling brass. In both cases the metal is claimed to be uon-oxidizable, proof against sea water, and, to a large extent, against acids.—D. W. Sugg, London.

EAST-BOUND railroads recently assisted tbe return movement of immigrants to their homes in Europe by making a $5 rate from Chicago to New York. It is said that "tbe $10 steerage rate has caused a movement averaging 1000 emigrants per day, who are mostly from the east of the Alleghenies." A $5 rate from Chicago to the seaboard, it is thought, "would result in tbe return of at least 500,000 additional people to tbe old country."

ACCORDING to the method wbicb is now adopted for reckoniug leap year in England, December, January and February will be the summer montbs about 720,000 years hence.



THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.



It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

Rich Mining Belt.

Correspondence Nevada *Herald*.

There are three valuable gold belts, from which there has been one hundred and forty millions of dollars in gold extracted from quartz alone, in the Nevada, Grass Valley and Alleghany regions, the Alleghany district extending from Moore's Flat across the ridges to Forest City.

At Moore's Flat there are several fair prospects, but with the exception of one, the Metropolitan, little has been done. On this mine considerable work has been done. The property is 3000 feet by 600 feet, the ore vein being two and one-half to three feet thick. The formation is serpentine and slate. It is claimed that there is good milling ore and plenty of it in sight. One tunnel is in on the vein over a thousand feet.

Surrounding the beautiful little mountain town to the south are some of the richest hydraulic gravel claims in the State, from which many millions of gold have been taken. They are very extensive. All are now closed, and where once was a busy, thriving little town, and happy and contented people, is now decay and desolation.

How easily all this condition of affairs could be changed if the gold, millions upon millions of it closeted here in Nature's vaults, could be taken out and made a blessing to both farmer and miner; for it is now well known that the proposed system of dams lower down upon the river would restrain all the tailings and also hold back billions of tons now in canyons and creeks, which without the dams will be washed down into the valleys.

There has been some work going on at the McKillican mine, on the river just opposite the town of Moore's Flat. Some very rich deposits of gold have been found in this mine, it being a continuation of the Plumbago mine at Chipps' Flat. The Plumbago mine is being worked by a tunnel, or a system of tunnels, several hundred feet in length. The vein is on the north bank of the South Yuba river, just across from Moore's Flat. On the same vein are several fine properties, viz., the McKillican, Hope, Colorado and Yellow Jacket. These properties have, at one time or another, paid handsomely. Gold to the amount of thousands has been taken out of these rich deposits. Several parties have quite recently made an examination of the Plumbago, with a view to purchase.

The Gold King mine of Alleghany was discovered by H. Y. Johnston, and is a northeast and southwest ledge, with a pay chute 300 feet long, the ore paying from $15 to $18 per ton. The company has a shaft down 250 feet and is now building a new ten-stamp mill.

On French ravine, the next ravine southwest, there is a good prospect which bids fair to be a mine, and a rich one. Two deposits have been found upon the croppings of this ledge, one of $12,000 and one of $14,000. The ore shows plenty of free gold and sulphurets.

The Idaho mine in Wet ravine joins the old Oriental mine on the south, and is, in my opinion, on the same vein, the writer having seen this mine open several years ago. It is about the same character of ore, but a trifle better grade, and apparently is more evenly distributed throughout the vein.

The Rising Sun mine is pretty well opened by a series of tunnels and shafts. The work is well directed with a view to open a good mine. The vein is strong and shows mineral freely. Mr. Hellman, its manager, has spent considerable time and money in bringing the mine to its present state. One can see no lost opportunities or money wasted, for they sometimes waste money, even in gold mines. I should say there is one ore chute pitching south which will prove a valuable one. A new mill is to be erected and the grading for it is now being done.

The Mariposa mine is looking well. The Sierra mine, just across the creek, is on the same vein. It is owned by Johnston of the Gold King, and has given good returns. The Rainbow has at times been a rainbow of gold to its fortunate owners. It has yielded many thousands. The shaft is 700 feet deep.

The Production of Lead.

Mr. Julius Matton "estimates the world's production of lead for the year 1893 as follows, in metric tons: Spain, 187,978; United States, 177,770; Germany, 94,191; Australia, 66,046; Mexico, 40,644; England, 36,070; Italy, 19,920; Greece, 35,241; Austria-Hungary, 10,161; France, 6605; Turkey, 1061; Japan, 914; Sweden, 762; Russia, 610; Canada, 539; other countries, 1896; total, 660,363 metric tons, or 650,000 long tons of 2240 pounds."

The estimate given for the United States is greater by 1829 tons than the amount given for the production of 1893 in the *Mineral Industry*. As we have no reason to change those figures, the total production of the world for the last year should be stated on this estimate at 658,524 metric tons.

If we accept Mr. Matton's estimate as approximately correct, and add to it the figures given in the *Mineral Industry*, we have the following as the world's output of lead for twelve years past, in metric tons:

1882	407,031	1888	635,341
1883	449,216	1889	595,926
1884	437,224	1890	586,903
1885	435,175	1891	626,686
1886	447,906	1892	645,435
1887	516,194	1893	658,524

This shows an increase in production last year of 13,089 tons, or two per cent over 1892. From 1882 to 1893 the increase was 251,503 tons, or 61.3 per cent. In 1893 the United States furnished 26.7 per cent of the world's production, being exceeded only by Spain with 28.5 per cent of the total.

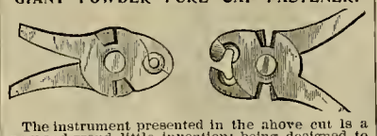
THE *Trade Press* says: "You can publish columns of matter of a complimentary nature about a man's business, and not only will you receive no thanks, but it is looked upon by the subject rather as his due, even though he has never given you a dollar's worth of business—it is 'news,'—'must have something to fill your columns,' he thinks—is 'of interest to readers,' etc., etc. But publish two lines about the business of this same individual which he construes as unfavorable, and the next mail brings a long letter that informs you that you have possibly 'ruined' his business and you receive pointed instructions on how to run a paper."

EVERY ounce of gold that is taken out of the ground adds a measure of wealth to the country. The same is true in a sense, says the Nevada *Herald*, of every cental of wheat. Yet the area upon which wheat may be produced is practically unlimited, while the area that produces gold is very limited indeed. Shall the millions of gold lie unclaimed in the mountains of California because a few acres of farm land may be in some danger of injury from its extraction? If gold could be produced almost anywhere, as wheat can, the question would be a different one; but it cannot. Gold is where you find it; wheat is where you put it.

THE engineer who is installing the electric power plant for the new Metropolitan Elevated Railway in Chicago figures that the use of electricity will save that company $300,000 a year in operating expenses, compared with the cost of running trains by authracite-burning locomotives.

"ELECTROLIER" is displacing "chandelier" in decorative terms.

GIANT POWDER FURE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.00 each.

MOODEY & SHERWOOD Fresno, Cal.

P. & B. PAINT.

Absolutely Acid and Alkali Proof.

For CHLORINATION WORKS and Preserving Wood and Iron from Acid Attack, Rust or Decay.

P. & B. ROOFING.

Send for Circulars.

PARAFFINE PAINT CO., 116 Battery Street, S. F.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

Built solely by the

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

South Milwaukee, Wis., U. S. A.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.

COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.

COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

SCHAW, INGRAM, BATCHER & CO., Hardware Merchants,

SACRAMENTO, CAL.

Send for Price List.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 22 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 23, 1894.

Silver at 66 cents is gratifying to those who have regretfully noted its steady depreciation. To-day's quotations are the highest since the 5th of last February. London financiers say it will go to 33d. The Chinese war is given as the prime cause for silver's upward movement, China being reported negotiating a £1,500,000 loan, of which £1,000,000 is payable to China in silver. London speculators are dealing in futures on silver, and the impression is that silver will not stop at present quotations. The Orient is still attesting its absorbent qualities. In peace or war that quarter of the world takes in silver constantly, and never returns it. Up to July 12th, shipments of fine silver from London to China aggregated in value £1,837,054; for the same period last year the aggregate was £324,903—this year's, so far, being more than five times what it was in the corresponding period in '93. It is reported in London to-day that the Indian mints are going to coin a British trade dollar to take the place of a Mexican dollar. They will find it slow work.

The Gorman tariff bill goes into effect at 1 P. M. next Monday, except that part which makes wool free, which event will take place January 1, '95. California's concern in it has been thoroughly discussed. In addition to the list given last week, the following shows some of the principal changes:

	Gorman Bill.	McKinley Bill.
Boracic acid, ₱ lb	$ 03	$ 05

—Tho steamer China from Hongkong and Yokohama arrived here last Saturday, making the run in eleven days and eighteen hours, breaking all previous trans-Pacific records. The trip was also remarkable in the fact that no Chinese passengers were aboard.

—The values of the lumber shipments from Puget Sound, foreign, for April, May and June '94 were: Lumber, $183,657; lath, $1157; pickets, $2888; shingles, $1495. Total, $189,187.

Mining Share Market.

SAN FRANCISCO, August 23, 1894.

The Comstocks were firm throughout the week, and the shorts were not particularly happy over the prospect. The ore in the 1700-foot level of the Con. Cal. & Va. gives an assay of $100 a ton, and it is expected by Saturday next the Mexican mill will begin crushing Crown Point ore. A Con. Cal. & Va. dividend is among next month's possibilities. It would have the added charm of novelty.

The following illustrates the changes of the week:

Coast Industrial Notes.

—Riverside wants to own a $20,000 electric light plant.

—Large numbers of Italians are returning home from this State.

—Over 250 negro miners have been imported to the coal mines at Roslyn, Wash., to take the places of the strikers.

—Petroleum is reported discovered at Mill Valley, Marin county. Three wells are to be bored and the region thoroughly exploited.

—The annual report of the San Francisco City Hall Commissioners shows that up to July 1, 1894, the hall had cost $5,279,582.30.

—The United Railroad Company has incorporated with a capital of $5,000,000. It purposes building a railroad up the San Joaquin valley from Stockton to Bakersfield.

—The board of directors of the Modesto Irrigation District have let the contract to the San Francisco Bridge Company for $65,000 to construct head gates, flumes and waste gates on the Modesto canal.

—From Portland, Or., is announced a reduction in the wages of Oregon Railway and Navigation Company employes of twelve and one-half per cent on all drawing over $100 a month, and ten per cent on all drawing over $50, to and including $100.

—Isaac Trumbo, who is here, says his project for building a railroad from Salt Lake, Utah, to Los Angeles is going ahead. He says that road can supply cheap coal from Utah, hituminous, cokiug and anthracite. "in unlimited quantities and at prices that will enable our manufactures to compete in the markets of the world with those of the East."

—With apparent ease the new hattle ship Oregon showed a rate of speed of eighteen knots on her preliminary trial trip last Wednesday. Should this rate be repeated at her coming official trial (and there is no reason to believe that it cannot), the Union Iron Works will earn a handsome honus for every quarter knot in excess of the required fifteen knots an hour.

—The hronze foundry of Messrs. White & De Rome, in this city, is attracting considerable attention hy the fine quality of its work. Some fine pieces of their work were at the Midwinter Fair. They are now casting the statuary for the Lick monument, the most recent piece being an 1800-pound casting, representing the prow of the vessel on which the figure of Commerce appears. This is believed to he the largest and most expensive hronze casting ever made in this country west of St. Louis.

—"The fall of 1895 will see boats passing through the locks at the Cascades, Oregon," says Mr. J. G. Day, the contractor having the completion of the great work in charge. Ahout 200 men are now employed on the works, and it is expected that steady labor will he afforded to a much larger force during the next eight months without interruption. A good deal of delay was encountered on account of the flood, hut the real damage sustained did not amount to a great deal and will not seriously affect the main work. The upper canal has been pumped out, and the masonry work has commenced on the main part of the locks. Had it not heen for the new dam, or upper hulkhead, work would have been still longer delayed, hut now it is fairly under way to accomplish as much as possible before the next high water comes. Unless there is some unexpected delay, Contractor Day is certain that the locks will he ready for operation hefore January 1, 1896, and the most stupendous picce of engineering work on the Pacific coast accomplished after working nearly twenty years.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 14, 1894.

524,479.—SHINGLE PACKAGE—M. J. Carkeek, Seattle, Wash.

524,666.—ARTESIAN WELL—F. Cavallaro, San Jose, Cal.

524,631.—SASH HOLDER—Thos. Chope, S. F.

524,667.—LAMP HEATER—A. H. Cowan, S. F.

524,417.—BEVEL AND SQUARE—T. Fahey, Spokane, Wash.

524,545.—FILTER—B. F. Field, Los Angeles, Cal.

524,500.—PROPELLER—S. G. Hinds, S. F.

524,553.—HOISTING APPARATUS—C. C. Kinsman, S. F.

524,561.—CULTIVATOR—Jas. Porteous, Fresno, Cal.

524,562.—RAISIN GRADER—Jas. Porteous, Fresno, Cal.

524,687.—BURNING CITY REFUSE—E. L. Ransome, Oakland, Cal.

524,688.—TREATING CITY REFUSE—E. L. Ransome, Oakland, Cal.

524,669.—CHIN CHECK — Thos. Raymond, Walla Walla, Wash.

524,504.—FRUIT BOX—G. C. Richards, S. F.

524,671.—TIME PIECE WINDER—H. Schumacher, S. F.

524,490.—WAVE MOTOR—Singer & Wood, Los Angeles, Cal.

524,567.—AMMONIA PURIFIER—R. G. Sneath, S. F.

524,656.—STORAGE BATTERY—B. C. Van Emon, S. F.

524,568.—FRUIT CARRIER—E. E. Wade, S. F.

624,624.—PROPELLER—Welch & Lovell, Astoria, Or.

524,496.—WORD REGISTER—J. E. Withrow, Los Angeles, Cal.

524,625.—FRUIT CARRIER—J. B. Wollard, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CULTIVATOR.—James Porteous, Fresno, Cal. No. 524,561. Dated Aug. 14, 1894. This implement belongs to the class of vineyard or orchard cultivators. Tbe invention lies in a peculiar and novel rearwardly extending bar attached adjustahly at one end to the lower end of the shank just hehind the shovel, and having its other end turned and adapted, when the whole har is emhedded with the shovel of the cultivator, to lie flat and present a hroad, flat surface within the ground, the object heing to prevent the cultivator from jumping vertically and to guide and steady its movement. This makes it particularly desirahle in vineyards and orchards, where it is necessary to cultivate close to the vines and trees, for in such cases it is of the greatest importance to steady and guide the implement to avoid contact and consequent injury to the vines and trees.

HOISTING APPARATUS.—Chester C. Kinsman, S. F., Cal. No. 524,553. Dated Aug. 14, 1894. This device belongs to that type of hoisting apparatus in which oppositely inclined tracks meet in a crest or apex; upon these tracks a trolley is caused to travel hy means of the main hoistiug rope or runner, and this trolley carries the load. Difficulty has heretofore existed because of one of the inclined tracks having a less inclination than the other; it resulted that the slacking away of the runner when the trolley reached the crest of the track merely had the effect of lowering the loaded tuh while the trolley remained stationary. To avoid this difficulty it was necessary to positively support the loaded tub on its course to the bunker independently of the runner, so that the trolley would move down the gentle incliue. Previous to this apparatus, this was accomplished hy a second trolley traveling on a second track and adapted to receive the load as the first trolley passed the crest of the tracks, hut by this apparatus, by means of a small automatically operating hook or latch, the same result is accomplished and the second trolley and track are wholly dispensed with.

CHIN CHECK FOR HORSES.—Thomas Raymoud, Walla Walla, Wasb. No. 524,669. Dated Aug. 14, 1894. This check comprises a U-shaped side picce, one ou each side of the nose of the horse and lying in substantially an upright position; a strap secured to the bases of these side pieces and passing under the horse's chin; a strap secured to their rear upper extremities and passing over the horse's nose, and a check strap secured to the upper forward extremities of said side pieces. A strain upon the check strap will cause the side pieces to act as levers, so that their rear extremities bear on the nose strap as a fulcrum, whereby the latter is tightened to place and at the same time the chin strap is raised up and tightened in its place. This leverage is a powerful one and so tightens the whole devicc in place that it will act as a complete rest for the horse's head, while uot interfering in any manner with the ordinary driving bit or its connections.

RAISIN-GRADER.—James Portcous, Fresno, Cal. No. 524,562. Dated Aug. 14, 1894. This machine is ono of those in which a vibrating shoe carrying a series of sieves is employed. In graders previous to this, the screens have been connected fixedly with the shoe and have had no other movement than that of the shoe itself. The connection in the present instance between the sieves and the shoe is of such a character that the former have imparted to them an independent movement accompanied by a jar or bump to effect additional agitation or impulse of the material, which, especially in the grading of raisins, is of great advantage in that it prevents the clogging of perforations or meshes of the screen, a tendency which raisins, on account of their gummy character, invariably have. To accomplish this result, the screen is supported loosely upon and secured at one end to the shoe, while its opposite end is free to move in vertical planes, and there are means for limiting the independent movement of the screen to produce a jar or bump.

MINING SHAREHOLDERS' DIRECTORY.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the Unitcd States, Canada, Mexico, all Britisb colonies and provinces, England and other civilized countries througbout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patont Ageney husiness conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Mineral or Agricultural?

On September 5th. U. S. Register Fraser and Receiver Gardner, at Sacramento, will hear the contest of Messrs. Prado, Weeks, Robinson and Moore, mineral claimants and contestants, against John Dyer, agricultural claimant and respondent.

The contest involves the question as to the mineral or non-mineral character of the southeast quarter of the southeast quarter of section 7, township 16 north, range 9 east, Mount Diablo meridian, in Nevada county. The contestant and witnesses are ordered to appear on the 15th inst. and show whether the land is more valuable for mineral than for agricultural purposes.

On September 20th they will also hear the contest of the Gold Bar Quartz Mining Company, the Central Pacific Railroad Company, Richard Ryan and all other mineral land claimants to the townsite application of Superior Judge Caldwell of Nevada county, in trust for the inhabitants of the townsite.

Judge Caldwell was requested by a number of settlers on the land, which adjoins Grass Valley, to apply for a townsite. The application was opposed by the Gold Bar Company, on the ground that the site is on mineral land. The proposed townsite embraces lot 3 of section 33, lot 6 of section 28, lot 12 of section 27 and the northwest quarter of the northwest quarter of section 34, township 16 north, range 8 east, Mount Diablo meridian.

On September 17th the Register and Receiver will also hear the contest of Samuel Newman, adverse claimant and contestant, vs. Henrietta and Hiram B. Barnes, respondents.

The contest involves mineral lot 37, section 18, township 10 north, range 19 east, Mount Diablo meridian, including the Altura quartz mine located in Alpine county. The contest was brought to determine whether Mrs. Barnes performed the necessary $500 worth of work on the land before she entered it in the Land Office and secured a patent to the land.

A Strong Protest.

The following is from the Grass Valley *Tidings:*

The miners employed in the Empire and North Star mines were informed Monday that their wages are to be reduced, and they were given three days to consider the matter. The wages are to be reduced as follows: Men now receiving $3 per day will hereafter be paid but $2.50; men receiving $2.50 per day will be cut to $2.25; and men now receiving the latter named sum will receive but $2. This means that Grass Valley, the most prosperous and largest mining town in the State, is to be reduced to the level of the dago mining camps of Amador and Calaveras counties. Three dollars a day has always been the prevailing rate of wages paid to miners in this district, and it is now to the interest of the miners and the business men to see that these wages are sustained.

The Nevada *Herald* of the 22d says:

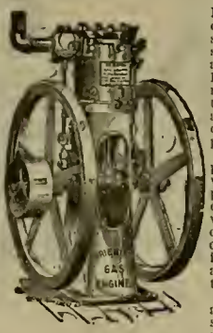
One version of the North Star reduction of wages is, that the men were asked if they were willing to work for the reduced rates, and they were told that if they were not the mine must close down, as it had been losing money for six months; that there was no attempt or intention of making an attempt to enforce the rates if the men objected. It is thought that a yielding of this point would result in making this a $2.50 district.

The men believe that the only way to keep up wages is to stand out against a beginning of a reduction. The matter has caused considerable excitement in Grass Valley.

Gold Quartz Mine For Sale.

A Good Quartz Mine, near Scott Bar, Siskiyou county, is offered for sale. Parties wishing to invest in quartz-mining property will do well to examine this ledge, from the extension of which ten-dollar rock is now being crushed. The average width of the ledge is two feet. For further information, call on or address W. A. CHAMBERLAIN, Yreka, California.

The Oriental Gas Engine



IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

LOANS AND MINES.

Loans negotiated on first-class securities. Mines and mining prospects of guaranteed value sold on working bonds. C. H. DWINELLE Grand Hotel, San Francisco, Cal.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

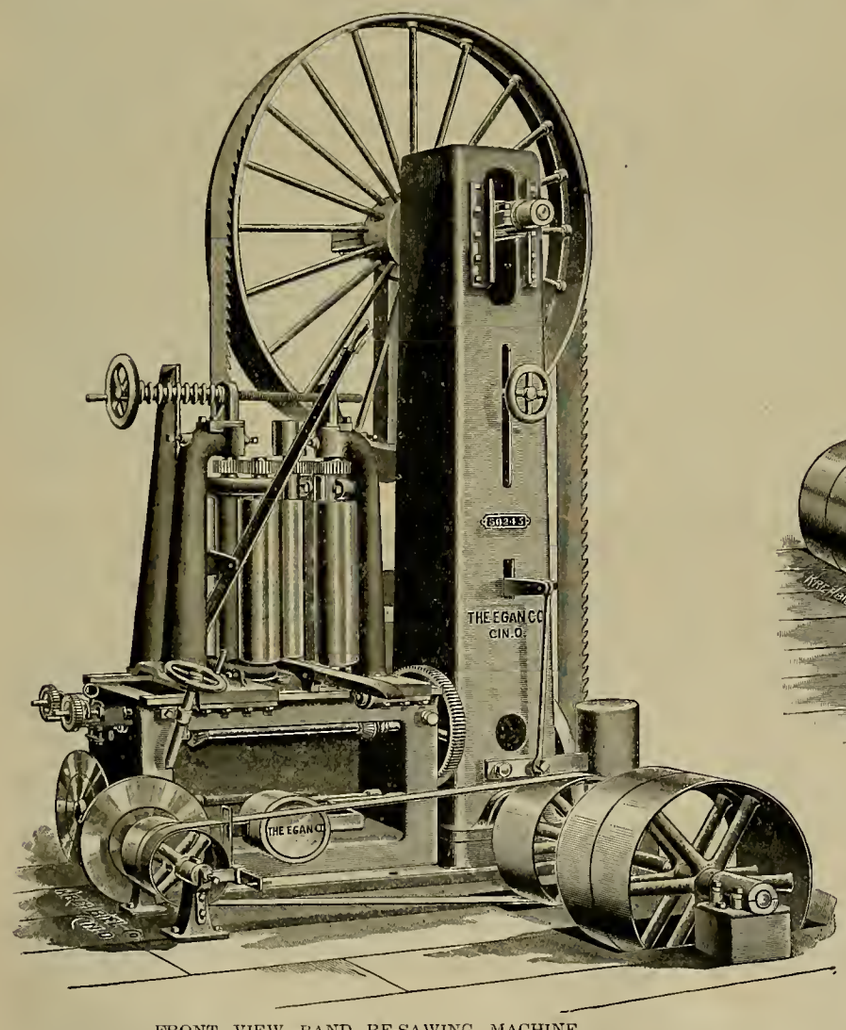
VOLUME LXIX. Number 9. SAN FRANCISCO, SATURDAY, SEPTEMBER 1, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Band Re-sawing Machine.

Herewith are presented a front and a rear view of an improved band re-sawing machine which has a capacity to saw stuff thirty-six inches wide and twelve inches thick. It is, of course, intended for use in large mills where a machine of great capacity is required. Though capable of doing very heavy work, the machine can also do light work, and an improved system of feed gearing—having the two front feed rolls close to the saw-blade, and a tension device connecting the top of roller brackets—enables the machine to straighten the plank while being sawed, making a great saving of time and material.

The wheels are sixty inches in diameter, made entirely of iron, with extra large hubs and steel spokes, placed staggering and perfectly balanced. The lower wheel is made thicker and more solid in the rim and is given thereby increased weight and momentum which much improves the action of the machine. Each wheel is supported by an outside bearing on each side of the column, there being three bearings to both upper and lower shafts. The shafts are of steel, are large in diameter and run in self-oiling boxes. The wheels are so connected to the shafts as to make it impossible for them to get loose or run out of true.

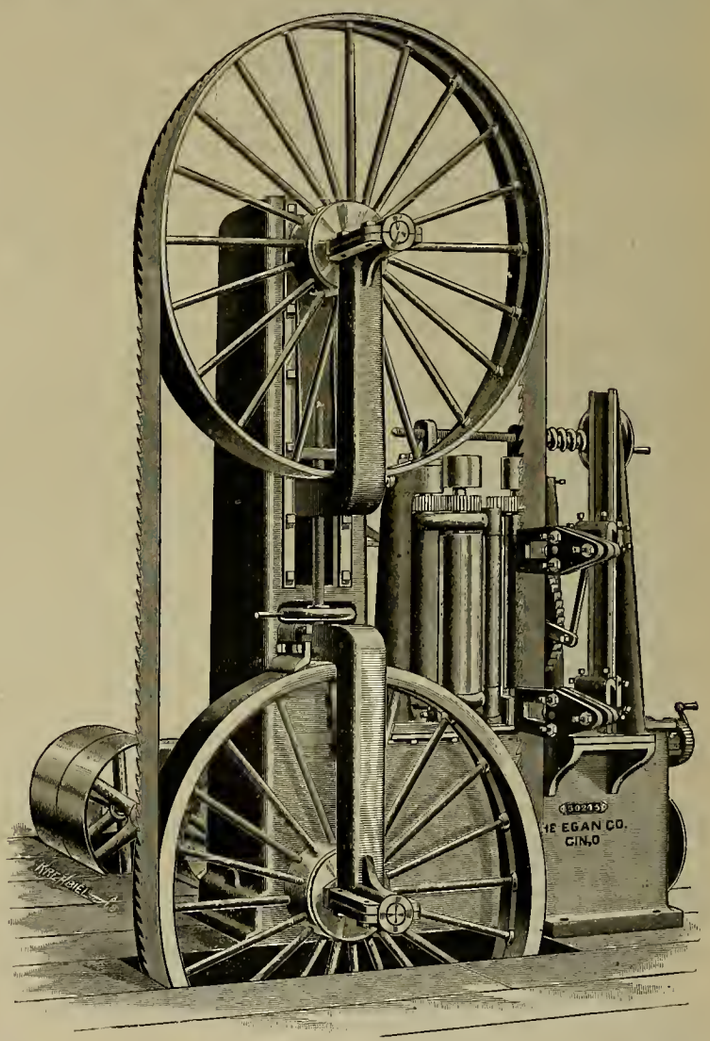
The feed is very powerful, consisting of six large feed rolls heavily geared,



FRONT VIEW BAND RE-SAWING MACHINE.

driven by a friction disk mechanism, enabling the operator to change the speed instantly, by turning a hand-wheel while the board is being fed through the machine. A ratchet lever handy to the operator is connected to the upper guide, made so as to change the guide instantly to suit the width of the board to be cut, and hold the saw-blade steadily in the cut.

Several pieces of narrow stuff can be cut, placed between the rolls one above the other. The rate of feed is from 0 to 100 feet per minute, according to the work being done. For saw mills, large planing mills, box factories, picture-back stock, furniture factories and trunk makers, jobbing shops, etc., the machine is especially recommended. A six-inch saw-blade and all necessary wrenches, etc., are furnished with the machine which is built by the Egan Company, Cincinnati, Ohio.



REAR VIEW BAND RE-SAWING MACHINE.

THE Tasmanian government has made a novel though commendable move in arresting a man for alleged salting of a mine. He tried to dispose of a mine at Mt. Huxley, and after the mining engineer had reported on it the vendor was taken into custody on a charge of conspiracy to defraud.

THE North Star mine, at Mokelumne Hill, will put in a ten-stamp mill. The gravel deposit has hitherto been hydraulicked, but the channel dipped and the deposit will hereafter be milled. About $20,000 has been taken out this year.

THOSE who like the excitement of "rushing" have now a great choice of places to rush to—Western Australia, South Africa, the Phillippine Islands, and now comes news of virgin gold fields of wonderful richness in Chili.

ABOUT seven hundred men are now employed in the mines around and near Telluride, Col. It is thought that in sixty days the number will be increased 300.

MINERS in the Forty-Mile country, Alaska, are reported having a tough time, by reason of the recent hard winter and the scarcity of supplies.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 138-9.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 142.

CHEAP rates prevail between Houston, Texas, and New Orleans, the 362 miles travel costing but twenty-five cents.

THE House bill, putting silver-lead ore on the free list, passed, but was sidetracked in the Senate, the three-fourths of a cent per pound in the Senate bill being the present duty.

ALL the State political parties have made their nominations; the election takes place November 6th. In November '92 the vote stood on Presidential electors: Democrat, 118,151; Republican, 118,027; Populist, 25,311.

THE surveyors now determining the boundary line between Nevada and California are at Genoa. It is reported that they find the new survey cuts off a strip of territory three and one-half miles in width from the south side of Douglas county, Nevada.

THE clerk of Siskiyou Co., Cal., has set his charge for recording a notice of suspension of assessment on mining claims at fifty cents. As the County Mining Association furnishes free blanks, the cost of complying with all legal requirements is commendably light.

ENGLISH EXCHANGES print reports from Mozambique, which indicate that the general era of gold development embraces that far-off territory. The Mozambique gold fields are represented to be rich and easily worked, and, if so, will swell the gold output of '94 to an extent proportional to the energy displayed in their development.

A RECENT alleged congressional enactment is a bill authorizing the taxation of treasury notes by States, counties and municipalities. These notes include greenbacks and other legal tender paper money issued by the Government. The treasury reports place the greenbacks in circulation at $346,000,000. In addition there are $131,000,000 of notes issued for the purchase of silver bullion outstanding.

THE cleverest trade paper in New York says: "No paper with a very large issue ever goes to the expense of printing its title page in two colors." It also says: "A trade journal with a thousand subscribers often has a greater number of readers of the sort the advertiser wishes to appeal to than the daily paper circulating a hundred thousand copies." In the same proportion, a trade journal or technical journal with 5000 paying intelligent subscribers offers better inducements to the advertiser in that line than a daily paper circulating half a million copies.

Black Sand.

At various points along the Pacific coast from Gray's Harbor, Washington, on the north, to Point New Year, thirty miles below San Francisco, on the south, there are found heavy deposits of a heavy black sand, of about the fineness of ordinary beach sand, which contain more or less of finely divided but rather pure gold particles. This is called black sand, from its color, which is usually black, and sometimes iron sand, from the fact that chemically it is mainly iron. The deposits are of two kinds—the old beach sands, meaning those which lie considerably above the present water level, and the new or late sands, which form part of the present beaches, and, like the other beach sands, are moved back and forth by the waves.

The gold-bearing sands along the present beaches are usually black in color and are composed mostly of particles of magnetic iron; that is to say, of the magnetic oxide of iron, called magnetite. In chemical constitution the substance is considered to be a mixture of the protoxide and sesquioxide of iron, having seventy-two parts metallic iron to twenty-eight of oxygen. It is hard, sometimes scratching glass; its specific gravity is about five. It is strongly magnetic and is infusible. It is found in nature disseminated through granite, gneiss, mica slate, syenite, hornblende slate, chlorite slate and limestone, and at other times forms extensive beds of ore suitable for making the finest qualities of iron and steel. It is the same as loadstone or native magnet, excepting that the latter possesses polarity. It is maintained by some that the magnetic ore in the shape of black sand is even better adapted for steel-making than that which occurs in beds. But why this should be so is not explained. With the iron, which usually amounts to half or three-fourths of the whole bulk, there are other substances which may be regarded as impurities. They are first, and most useless and deleterious, titanic iron, called ilmenite, a substance possessing the same hardness, color and specific gravity as magnetite, but of no use in the arts, although it is rich in oxide of iron, and is prejudicial in smelting. Rounded quartz sand forms a varying proportion of the beds, sometimes nearly the whole and sometimes being entirely absent. The gem called zircon, a silicate of zirconium, also exists in the beach sands, and is not rare, though too small to be noticed except mineralogically. These, with other and rarer substances, make up the black sands, with the exception of the contained gold which is supposed to be always free or unincumbered.

During the time that experimenters have been dealing with the problem, a large number of people have been making a living and some few getting rich by working the sands in the simplest and cheapest possible way; namely, by sluicing or rocking. It was in 1852 that the first work of the sort was done; it commenced that year on the California coast at Gold Bluff, near Crescent City, and in Oregon at the beaches at the month of the Rogue and Coquille rivers. Over a thousand miners were engaged in the industry at various points along the Pacific shore in the following years, the most being congregated near the points named, where the sand was richest. Work has been kept up at those localities, and intermittently at many others. No close estimates of the number of miners engaged therein have ever been made, nor of their earnings; but estimates for particular years have often been published. Probably the average number of miners employed steadily at this work would not vary much from 500, taking the years together. There has been a gradual decrease from 1856, when the number was greatest. In that year the coast of Curry and Coos counties was the scene of very active operations, and the former county contained then and for several subsequent years more people than it has at present. Large camps were built up at various points, and some of them remain populated at this day. Randolph, at the mouth of the Coquille, the center of the "high" or old beach mining industry, was the principal camp. Still, the resources of gold are not by any means exhausted, nor are they exhaustible if judged by their present appearances. There is hardly any diminution of riches noticed in the moving sands of the lower beaches, while the high deposits have hardly been touched. Explorations continually reveal more of the latter, and the ocean is continually providing more of the former.

The product of the Pioneer mine in Coos county, Or., was $18,600 in one year.

The most important "old beach" deposits occur about the mouth of the Coquille river, Coos county, where there are beds of many feet in thickness, overlaid usually with barren sand and other debris to a greater or less extent, the principal bed being buried under such a thickness that it would require extensive mining operations to obtain the gold which is known to be disseminated therein. For working a deposit of this kind, a system of drift mining is recommended, whereiu the overlying mass of gravel is supported temporarily by timbering, while the auriferous materials are sluiced out and the gold recovered. An open cut might be run to the sea, in which cut a long line of sluices with riffles should be stationed. Working a block of gravel here several feet in depth, although lying under from twenty to forty feet of worthless material, might be expeditiously and safely performed this way. These deposits have a sameness of description; they lie 30, 60, 100 and even 300 feet above the present beach, and are referable to various periods of elevation of the shore line, probably not, geographically, very ancient in any case.

In Tillamook, Or., a new process has been introduced by which it is claimed that fully ninety per cent of the gold can be saved. The body of black sand is almost unlimited, as it is found nearly everywhere on the ancient beach which extends inland along the Coquille river about two miles and has been traced north and south to a considerable distance. A complete successful process would be hailed with joy all along the coast.

Since the above was in type, the following was noticed in the current number of a Del Norte Co., Cal., paper, published close to a large deposit of this sand, and is here appended as illustrative of hundreds of similar items that have been published in this paper in the last thirty-four years, exemplifying the fact that the industry is a permanently paying one, and that there has been little change in the successful methods of securing the gold:

The black-sand mine of E. Yates, a couple of miles below Crescent City, is running in full blast, and indications are that it is a bonanza. The machine used for saving the fine particles of gold is similar to the "Old Tom," in use for many years in mining along the beaches. In this machine twenty-five square feet of corrugated copper plates are used, the usual mercury being put on. After the sand that contains the gold passes over the plates, it passes over a blanket. Should the plates fail to catch all the gold, the blanket does it. Mr. Yates believes that almost every particle of gold is saved. In a run of fifty hours about $100 was saved. In a run of fifty hours about $100 was saved. The indications are that the other portions of the property are richer than this, as it is among the driftwood that he is now getting his sand.

IN view of the fact that a bill passed a few months ago by Congress instructing the Secretary of the Treasury to coin the silver seigniorage was vetoed by the President, it is interesting to note the present mint activity in the coinage of the seigniorage and also the principal. Mint Director Preston, discoursing on the 423,000 standard silver dollars minted in July, says that the bullion from which these dollars were coined was acquired under the act of July 14, 1890, which is the only bullion held by the Treasury available for the coinage of silver dollars. The cost of the bullion contained in these dollars was $285,-661.75, showing a gain or seigniorage of $137,338.25; consequently, $285,661.75 will be held for the redemption of treasury notes, and $137,338.25 will be used in the payment of the obligations of the Government and will add to the circulating medium to that extent. A much larger amount was coined last month, and it is understood that the millions of silver on hand will be thus speedily put into circulation.

SIX societies in New York and Pennsylvania will send a joint committee to New York next month in a movement to secure new designs for the silver currency, and will then consider the advisability of holding an exhibition of ancient and modern coins, so that the defects in our currency may be demonstrated. The committee will also probably propose to the Government that a change in coin designs be made at regular intervals of ten years, and that each

new set of designs be typical of the preceding decade. The Natural Sculpture Society, which is interested in the movement, has offered prizes of $300 and $200, respectively, for the best and second-best designs for a new dollar, the competition to be held in 1895. These designs will be submitted to Director of the Mint Preston, and by him referred to the Secretary of the Treasury. The Treasury Department has taken no official notice of the proposition of the society, and Mr. Preston has not sanctioned it officially, but expressed very strongly the wish that new designs could be adopted for all the silver coins.

Concentrates.

THE "smelter clearing house" at Denver, Col., is to be abandoned.

THE Orleans mine stamp mill near Grass Valley is in satisfactory operation.

THE Phœnix mine above Sierra City, Cal., is to be fully prospected and developed.

The Angels *Echo* hears that the Bluir mine has been sold for three hundred thousand dollars.

THE Grass Valley Miners' Union has received over 200 new members during the last two weeks.

THE twenty-stamp mill of the Imperial Gold Mining Co. at Kennedy, Nev., started up last Monday.

THE McKillicun mine at North Bloomfield has been bought by Arnold Becker and others of this city.

THE Dower mine at Nevada City has been sold to three San Francisco men, who will develop the property.

THE Gladstone mine at French Gulch, Trinity Co., has satisfied its financial obligations and will resume.

THE gold yield of Cripple Creek, Col., for the first half of last month was at the rate of $8,500,000 per annum.

JOHN H. MURRAY, a miner, fell 500 feet down a shaft in the Bell of Butte mine last Saturday and was instantly killed.

THE Consolidated California & Virginia mine shipped to the Carson Mint bullion to the value of $107,329.42 during August.

OWING to the low grade of ore, the mill at Cargo Muchacho, Cal., has closed down and operations are confined to prospecting the mine.

GRANT COUNTY, NEW MEXICO, according to the Silver City *Enterprise*, last year produced silver to the value of $1,111,037.47.

THE Harmony Gravel Mining Company, Nevada county, Cal., has levied an assessment of ten cents a share, delinquent September 24th.

THE plaintiff in the suit of the Wyoming Company vs. Champion Company in the United States Circuit Court has filed its bill of costs, amounting to $12,316.02.

THE Houston copper mines, Custer, Montana, have been leased by W. A. Clark & Co., of Butte City, and will be worked by a large force this fall and winter.

A DENVER company is trying to turn the Rio Grande river near Durango, Col., to clean up the gold believed to be in the river bed. A canal has been dug, and a dam is building.

FOR the year ending June 30, '94, the Anaconda, Mont., Copper Mining Co. reports its gross receipts to be $11,131,731 and its expenses $8,303,642, leaving a profit of $2,828,089.

THE July report of the Alaska-Treadwell Mining Company shows that 20,271 tons ore were crushed, averaging $3.21 per ton, a shipment of $65,085 in gold to this city resulting therefrom.

COCHITI, New Mexico, claims to have a dozen mines that give assays of more than $100 per ton on an average, from veins that vary in thickness from five to seventy-five feet. It is a great boast.

THE shaft house at the Amethyst mine at Creede, Col., caught fire last Saturday, and the iron cage, heated red hot, fell to the bottom of the shaft, killing four men who were coming up on the ladders.

A COLORADO mining paper confidently asserts that with the new and improved methods of mining, it is thought that it will cost less than twenty-two cents on the dollar this year to mine gold in Colorado.

THE case of Edward Chandler vs. the West Con. Virginia and California Mining Company, asking for wages amounting to $1057, was decided last Wednesday by Judge Rising in Virginia City in favor of defendants.

THE Electric Placer Mining Company has incorporated in this city. Capital stock, $1,000,000, with S. M. Losch of Auburn, and J. R. Kendall, P. T. Burrell, E. A. Trefethen and A. R. Vining of Oakland as directors.

THE Kennedy, Nev., *New Era* says: Chinamen from American Canyon are coming into Kennedy on foot by way of Cinnahar Summit. They have been engaged by white men to work placer ground in and about Kennedy.

LAST SATURDAY the Centennial-Eureka Company of Utah declared dividend No. 56 of 50 cents per share, aggregating $15,000. Within a period of fifty-six months this property has paid a total of $840,000 in dividends, or $28 per share.

THE Great Northern Railway system has been divided into three divisions, a general superintendent being placed in charge of each, and the general superintendency as it has existed being abolished, involving several official changes.

THE Marion Gold Mining, Milling and Prospecting Company is organized at Rapid, South Dakota, with a capital stock of $300,000. The company will operate the Marion group of gold mines situated on Elephant gulch, four miles west of Custer City.

OWNERSHIP of the Rose Hill mine, on Winchester Hill, near Grass Valley, has been transferred to Messrs. Parker, Wishart & Moody, who are now getting machinery in this city to develop the property, which has paid well so far as worked.

RECENT Alaska reports say much excitement is reported in the Yukon river region over rich gold discoveries. More than 1000 men are said to be in that region engaged in gold placer mining, and $100,000 in gold is at Juneau awaiting shipment to this city.

COSCA, GARCIA & Co. work a new mine near the Colorado mine, Mexico, called the Zaragoza, and believe that the work begun will at a certain depth encounter the famous vein of "Colorado" from which millions of dollars have been extracted by the owners.

THE most costly of all metals, save only gallium, which is worth $3000 an ounce, is germanium, which is quoted at $1125 an ounce. Rhodium is worth $112.50 an ounce; ruthenium, $90 an ounce; iridium, $37.50 an ounce; osium, $26 an ounce, and palladium, $26 an ounce.

ALL work has been suspended in stopes 21, 22 and 23 of the North Star mine at Grass Valley. The work now being carried on at the old mine is in the 2000 intermediate, west. Eighty men and boys working in the mine have been laid off; only twenty men are now at work.

THREE evangelists recently held a revival meeting in the Ontario mine, Scranton, Pa., at the bottom of the shaft. Slips of paper with the words of hymns printed upon them were handed around, and the miners, gathered in the gloom of the mine, joined heartily in the service of song.

Ores and Metals says nearly every mine of consequence in Ouray county, Col., is now being worked. There seems to be a belief that silver has reached its lowest point and from now on will take an upward turn. Many of the silver mines in Ouray county, however, are so rich that they can produce silver at sixty cents, and therefore they will be worked.

THIRTY-SEVEN miners were killed last Saturday by a fire in the Franklin, Wash., coal mine. The verdict of the coroner's jury on the bodies of the miners states that the fire was caused by the act of some malicious incendiary. This is a surprise to those not directly interested, and seems to be based on the fact that the fire could not be explained in any other way.

A SYNDICATE of Colorado and Wyoming mining men will develop the copper deposits discovered last fall on Gold and Mill creeks in Sweetwater county. The lead is 140 feet in width and lies between well defined walls. Assays show that the ore contains copper, gold and silver, some of it running as high as $100 to the ton. The syndicate will put in a forty-ton smelter.

THE Mexican Gold and Silver Recovery Co., of Loudon and Mexico, are entertaining the proposition of establishing a plant for the reduction of gold and silver ore by the cyanide process at Nogales, Arizona. J. H. Palmer, the agent of the company, went to Hermosillo, Mexico, a few weeks ago to erect a plant there, but not being entirely satisfied, will recommend Nogales instead.

THE Dayton, Nev., *Times* says that there is a large deposit of silica in Lyon county, near Clifton. San Francisco men have been to see if it was fit for their use—that of covering steam pipes, etc. It was decided to be the right kind of composition, and a carload of the material is now being taken out for shipment to this city. There is a mountain of the stuff, and it ranges in value from $15 to $25 per ton, according to its purity.

THE Idaho *World* says a cleanup was recently made at the Boulder, after crushing 126 tons. The yield was $5000—over $41 a ton. The ore that was milled was about fifty per cent iron sulphurets. These sulphurets run high. The tailings are held in tanks and a reservoir, and will at some future time be worked by the cyanide process. The Boulder has one vein of solid sulphurets, two feet wide, that assays $140 per ton.

THE Calumet & Hecla copper mine has what is considered to be the biggest hoisting engine ever built. The shaft in which it works is claimed to be 7400 feet deep; the engine is large enough to hoist from a depth of 6000 feet. The drum consists of a double cone, with the greatest diameter in the center and tapering toward each end, the smallest diameter being 13 feet 9 inches, the greatest diameter 36 feet, and distance across the face of both cones 24½ feet.

THE new Nez Perces Indian treaty law carries $1,668,622; $668,622 is to be paid as soon as the department can arrange the necessary details. Representative Sweet of Idaho says the work is progressing rapidly. The Division of Accounts is preparing a list of those entitled to payment under the agreement. Land will be opened for settlement by proclamation of the President in ample time. Agricultural land is to be sold at $3.75 per acre, and mineral, stone and timber lands at $5 per acre.

THE Redding *Free Press* says the Kosciusko Mining Co. is meeting with grand success with the old Quartz Hill mine. Four hundred tons of quartz have been worked by the free-milling process in the Calumet mill, and the daily product is about forty ounces in gold. Quartz Hill is a mountain of ore, which can be quarried out at small expense, and by a railroad the ore is taken to the mill on the river bank, which is run by water power. The ore is of low grade, but the facilities for mining and working are such that the cost of production is not great.

THE Empire Mining Company incorporated in this city last Wednesday to work the Empire mine, situated in Shasta county, and other mines; to extract and mill ores; to acquire and sell mines and water rights, and to erect and operate mills and reduction works. The capital stock is fixed at $250,000, divided into 50,000 shares at a par value of $5 each. The entire amount of stock has been taken up by the following, who are also the directors: John H. Morton, $62,500; W. B. King, $62,450; Grace V. King, $50; Alameda L. Bell, $124,750; Henry H. Bell, $250.

IN more ways than one, says the Australian *Mining Standard*, South Africa presents striking examples of mining enterprise. The latest is in the direction of the amalgamation of gronps of mines into single self-contained concerns with the view of conducting operations upon an enormous scale. There are several combinations of this character, and others are projected. The almost illimitable low-grade ore deposits of the Witwatersrand and other fields can only be made to yield profits by the employment of huge capital and the centralization of power and machinery. South African financiers are fully alive to the necessity for progressive measures; they are dominated by enterprise; the mere bigness is not likely to stand in the way of the consummation of their schemes.

TALKING of Comstock matters, the Virginia *Enterprise* says: Work has been abandoned on the 1000 level of the Con. Cal. & Virginia mine, which is being worked through the old Con. Virginia shaft. The only work which yet remains to be performed there is bringing out tools, car track, pipe, etc. This is the level where Rule did his famous contract work, which was continued by the Con. Virginia Company after his contract had expired. Neither Rule nor the mine-owners struck anything of a paying nature, although the indications promised better results. Sixteen men, whose wages augment the pay roll $2000 every month, will be thrown out of employment by this move, unless, as reported, they are retained and put to work on the recently discovered ore body on the 1650 level. A sinking engine was recently put in on the winze from the Central tunnel in Ophir croppings, and it is said that more men are to be put to work at that point. The winze is being cleaned out and repaired at present. This renewal of attention to the Ophir is hailed with delight by Comstockers.

THE Nevada State Republican Convention last Monday adopted a platform in which is said "the silver question is regarded as the most important before the people to-day. Its demonetization increased the burden of all debts and enriched the creditor classes at the expense of everybody else. It paralyzed the productive energies of the entire country, depressed business of every kind except that of money lending, and there can be no permanent return of prosperity to our country until silver shall have been restored to its full use and highest position as a money metal. The free and unlimited coinage of both gold and silver at a ratio of sixteen to one, with full legal tender functions to each and no discrimination against either, is demanded. This action is asked of the United States actiug independently and wholly regardless of what any other nation may or may not do."

CONSIDERABLE work is being done on the Daggett and El Dorado ditches and flumes in El Dorado county. The Daggett ditch heads in Pilot creek a short distance below the El Dorado ditch, and will be finished to Mount Gregory in two weeks. It is twenty miles long, two miles of which are flumes four feet wide and thirty inches deep. The work is being done by the San Francisco Bridge Company. Next season a 1300-foot tunnel will be driven, shortening the ditch two miles, thus overcoming the dangerous slides experienced nearly every winter. The capacity of the ditch is 2500 inches. The grade of the flumes is five-tenths and that of the ditch three-tenths of an inch to the rod. Mr. Daggett has already expended about $100,000 upon this ditch. He will extend it to the Rubicon next year, a distance of twenty-two miles from its present head in Pilot creek. This ditch will be about 1125 feet lower in altitude than the main ditch of the California Water Company at the nearest point. The Rubicon watershed covers an immense area of territory in both Placer and El Dorado counties. Several small lakes lie within this basin, and natural advantages for immense storage are said to exist. It will require several hundred thousand dollars to carry out Mr. Daggett's scheme to secure a supply of water during the latter two months of the dry season, adequate to San Francisco's wants, independent of the expense of conveying it there after it reaches Pilot creek. There is no confliction or even competition, so far as we are able to learn, between this enterprise and the California Water Company, and even if there was, it is to the interest of the public that it be fully carried out. If the Rubicon ditch is ever completed, the line of the main canal will be constructed down the divide through Georgetown. There will be a demand for all the water it is possible for both canals to supply. The El Dorado ditch, the property of the California Water Company, extends from the junction of Mutton canyon with Pilot creek for a distance of about thirty miles to the company's main canal, a few miles above Georgetown. The upper portion of this ditch has been idle for the past few years, but the company have resumed work and will undoubtedly have the water of Pilot creek running in their main canal by November 1st, thus retaining all legal rights to their share of the waters of Pilot creek. The work is progressing rapidly. There will be about two miles of flume, three feet wide by eighteen inches deep, calculated to carry 400 inches of water, all that Pilot creek affords at low water, the entire flow now not exceeding 500 inches. This ditch also covers the mines of Mount Gregory ridge and Volcanoville.

Personal.

STATE DEBRIS COMMISSIONER KIDDER is in the city.

DENVER WAGGONER is now superintendent of the Uno mine, Amador county.

WILLARD GARDINER is the newly elected superintendent of the Granite Hill mine, Grass Valley.

W. G. STEGMAN has assumed charge of the assay department of the Confidence M. & M. Company at Whitewater, New Mexico.

E. R. ABADIE has resigned the superintendency of the North Star mine at Grass Valley, and has accepted a responsible position in South Africa.

C. M. GORHAM retired from the office of coiner in the U. S. Mint in this city yesterday, which position he has held for twelve years. During his incumbency he turned out $273,000,000 in gold and $39,000,000 in silver. The mechanical wastage during his time has been only 4½ per cent of the allowance permitted by law. Mr. A. T. Spotts is his successor.

GEORGE H. ELDRIDGE, geologist of the United States Geological Survey, has inaugurated the work of making a geological survey of Idaho in accordance with the plans recently promulgated by the director. He has a party on the headwaters of the Clearwater. It is the purpose this fall to make a hasty reconnoisance of the State so as to secure a general idea of the work needed. He will make a report to the department of the results of this preliminary survey, and during the winter plans for detailed work will be formulated.

Obituary.

Henry Schmiedell, the last surviving charter member of the San Francisco Stock Exchange, died last Saturday. In the big bonanza days he made a fortune in the mining stock brokerage business in this city and made many life-long friends.

Mr. Jno. F. Lohse, secretary of the California Powder Works, died in this city last Monday in the 70th year of his age. He was a '49er, and for many years had active part in the mining industries of this coast.

Methods of Mine Timbering.

NUMBER II.

SHAFTS.—Working shafts, as well as tunnels and drifts, should be arranged with a view to securing their permanency. Indeed, in consideration of future possibilities, even greater care should be exercised in the seleetion of their location and in deciding upon their size, while the manner of timbering is most important. Working shafts should be so equipped as to remain open and be in use as long as ore remains in the mine which it will pay to extract. As in all other mine work, the amount of timber required depends largely on the size of the shaft and more particularly on the character of the rock through which it passes. Prospecting shafts are sometimes sunk in good-standing ground to the depth of several hundred feet without other timber than a few stulls, to which ladders are secured. The few timbers thus placed ofteu become insecure through neglect, particularly in regions where there are climatic alternations of wet and dry. When wet, the timbers and the wedges securing them swell. With the change to dryness they shriuk aud are likely to drop out. An additional danger results when the rock walls crumble, and men working below are in constant danger from falling rocks and timbers. The wedges demand frequent attention, for they must be kept driven well in at all times. Ou the desert and in mines above timber line, where timber is expeusive, miners endeavor to get along with as little as possible and are not very particular as to the kind and quality of that which is used. It would perhaps be a better plan to dispense with timber altogether than to place too much dependence on sticks that are likely to drop out of position unexpectedly. As a matter fact, the writer has seen shafts in the Mojave desert mines more than 200 feet in depth without a single stick of timber. The necessities of the case in sparsely timbered regions and on the desert have obliged the miner to resort to many novel plans to protect himself agaiust danger at the least possible expense. He puts in as substantial a frame of timbers as he can obtain, or as he may think he can afford, using a few frail saplings, thin, split lagging, or even brush, to support the sides of his shaft. Fortunately for him, in the desert regions, where scarcity of timber forces upon him this economical "system" of timbering, the rock, being nearly always dry, stands fairly well, as a rule, and expensive timbering is not necessary.

The extremities to which prospectors are often reduced to procure timber in these timberless regions has resulted in the adoption of a method peculiar to such districts. While the result is not particularly pleasing from a workmanlike standpoint, it uevertheless exemplifies most faithfully those principles which are the foundation of the most elaborate system of timbering. In these shafts all timbers are stulls, each one being placed to support some particular rock or mass which seemingly threatens to fall. Each stick is independent of the others; there are uo superfluous timbers, and no attempt at system or regularity. As a result these sticks cross the shaft at mauy angles. Some are horizontal, but most of them inclined somewhat from that position. It sometimes gives the shaft timbers a spiral appearance as viewed from above. Despite the fact that these timbers are placed so much at variance with recognized methods, if placed at the time of making the excavation, or shortly thereafter, and are properly and firmly wedged, they usually render the shaft fairly safe. In that regiou old redwood railway ties are very frequently used for mine timbers, and answer admirably, even though unsuited for such use from having lain for months in a railroad bed, being split and often cut by the rails. The miners are glad to get them, poor as the timber is, for when once properly placed they have been found to do very well, when the pressure is not too great.

FIG. 15.

Shafts having a single compartment, such as are frequently seen in small mines, are timbered in a simple manner. The timbers consist of two wall and two end plates and four posts to each set. The method shown in Fig. 14 C is quite common and suited to shafts of moderate size (5x7 in the clear), having a single compartment. The four frame timbers are placed in positiou and tightly wedged, the posts being driven in at the corners. Care must be taken to keep the sets in line. Sets are ordinarily five feet apart from center to center. When the ground is heavy, sets may be placed closer than five feet. They are often only half that distance from center to center.

Lagging, either split or sawed (two-inch plank), is driven in behind the timbers. It is driven one-half to three-quarters of the way down, when the lower ends of the next set below are inserted between the timber and the wall. Later the lagging of the set above is driven down to its proper place.

When the pressure of the ground is very heavy a crib of timbers is built, the timbers being placed one on another with only a notch at the ends to hold them in place. In soft ground it may be necessary to use lagging, even in a cribbed shaft. All open spaces between the walls and the crib or lagging should be filled with broken rock to secure firmness, and to counteract any tendency of the timbers to shift. The manner of framing crib timbers is shown in Fig. 14 B.

When sinking can be carried on somewhat in advance of timbering, it is sometimes the custom, in

firm ground, to place long timbers, called "reachers," across the shaft, the ends resting in niches cut in the walls. These having been firmly placed, the four timbers of the set are laid upon them and firmly wedged, and from the foundation the sets are built upward to the next set of reachers above, a distance of twenty-five to thirty feet. Where the shaft is sunk in country rock, or in a large pillar of ore (the latter to be avoided when possible), the reachers are placed alternately in sets at right angles.

Men working in shafts placing timbers usually work suspended on slings secured to timbers above.

In places where the above described methods of building sets of shaft timbers on reachers is not possible, owing to the soft nature of the rock in which the shaft is sunk, or where it is desirable to run cages to the bottom of the mine, it was formerly the custom to suspend the shaft timbers by ropes in a position as near to that desired as possible, and to then maintain them in that position by driving iron dogs into the timbers, the weight being supported by the set next above, which had previously been supported by wedges. In some cases these dogs were never removed. Many of them may be seen in the older California mines. The dogs were made of round or square iron bars 1x1 inch or 1x1¼ inches, and having the ends turned at right angles. The points were three or four inches in length and sharp. The length of the dog was determined by the distance from center to center to center of the sets.

When the rock was sufficiently firm to admit of the timbers being firmly wedged the dogs were knocked out. Iron dogs or bolts are useless as a means of support when the surrounding rock masses have once firmly settled on the timbers.

A safer and more convenient device has been introduced in later years, in the form of iron bars having a thread at one end and a ring or hook at the other. These go in pairs, their combined length exceeding by six inches the distance from the top of one set to the bottom of the next set beneath. The manner of using these hangers is as follows: A set having been securely wedged in its proper position, the threaded end of the bolt provided with a hook is passed upward through a hole in the plate (bored in all timbers for the purpose), a washer passed over the end of the bolt, and a threaded nut screwed down onto it. A second "locknut" may be used, but is not necessary. A second similar bolt with hook is passed through a hole near the opposite end of the same timber, and also secured with washer and nut. The timber to be placed directly below is suspended by ropes in a position approximating that desired and a bolt having a ring at one end is passed downward through this timber, immediately below that in the timber above, and a similar bolt is passed through the opposite end. Washers and nuts are placed on the ends of these bolts and the rings are caught in the hooks of the bolts above. The nuts may now be turned and the timbers drawn to exactly the position required, when the ropes may be removed. All four of the timbers of this set having been placed in position, and being suspended on the hangers, the posts are slipped in, the nuts tightened still further, and the whole firmly wedged, when the next set below may be put in in like manner. The hangers are left a few days or weeks, and in some instances permanently, but, as previously stated, they are used as a means of support when the weight of the surrounding rock has settled on the timbers.

Where, owing to the soft nature of the ground, it is thought desirable to have the hangers remain in place indefinitely, a bar having a thread at one end and simply turned at a right angle at the other, or having a solid hammered head with a washer, may be used, being passed upward through the bottom timber and then through that above, where the adjustment is made by means of a washer and nut; but as these bars are longer than the distance between sets, their removal is impossible, a set below having once been put in place. There is no question as to the superiority of the bolts having rings and hooks for either temporary or permanent use.

It very frequently occurs that shaft timbers have to be removed and new ones inserted, and is also often necessary to reinforce timbers already in place. This work frequently necessitates the suspension of hoisting through the shaft. The superintendent of the Wildman mine, at Sutter Creek, Amador county, California, having occasion to retimber the shaft between the 500 and 600 levels of the mine, constructed a chute one foot square of two-inch plank in one corner of a compartment of the shaft reaching between these levels. It was built in short sections, each the length of a set of timbers. The work of retimbering was commenced above and carried downward, all of the refuse rock, timber, etc., being dumped into the chute. This material was taken up on the 600 level, dumped into a skip from time to time, and sent to the surface; by this means the work was quickly and safely carried on, sections of the chute being removed to keep pace with the work. By means of this device there was very little delay in operating the skips, and hoisting of ore was continued almost without interruption during the retimbering of that portion of the shaft.

Large shafts are separated into two or more compartments by placing timbers called "dividers" at intermediate points between the end plates. They reach from the wall plate on one side to that on the opposite side of the shaft. These dividers are framed with a short beveled tenon, broader at the top than at the bottom. These tenons fitted exactly into mortices or notches in the wall plates. At each of the four corners of the shaft and between the wall plates, opposite each divider, is placed a post, which is set in a shallow notch or seat cut in the plates. In size the posts may equal that of the plates, or if desired they may be of smaller dimensions. The dividers are made the same depth as the wall plates, but are usually narrower across the upper face.

The dividers separating shafts into two or more compartments may be made most secure by permitting the upper portion of the beveled tenon to extend into the wall plate two or three inches, the bottom portion being let in but one inch. The post setting directly on the divider holds it much more firmly, and the danger of having the dividers knocked out by shots fired directly below is greatly decreased, if not obviated entirely. It not infrequently occurs when dividers are framed so as to set but one inch into the wall plates a heavy blast will tear them out altogether, incurring expense of timber and time, which may be avoided in the manner stated above.

Drawings of two Comstock shafts illustrate the manner of framing and placing timbers in them. One of these is called an "L" shaft, and was sunk by the Overman and Caledonia companies jointly. It is known as the Forman shaft. The other is the Requa shaft, sunk by the Chollar, Norcross and Savage companies. It is a large rectangular shaft having four compartments, and is a splendid example of its kind.

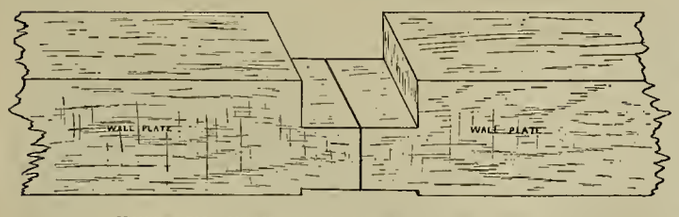
FIG. 15 A.



FRAMING FOR SPLICED WALL PLATE AND OVERLAPPING DIVIDER, FOR SHAFTS.

In size, shaft timbers range from 8x8 to 20x24, and even larger timbers are sometimes employed in very heavy ground, particularly in inclined shafts. The wall plates are usually broader on one side than on the other, and are placed in position with broad side up. End plates are usually the square of the smaller dimension of the wall plate.

Pumping and manway compartments do not require lining, but hoisting compartments, particularly where cages are run, should be lined throughout to prevent accident to men who sometimes overcrowd a cage. There appears to be less danger of this where buckets or skips are used. Every shaft in a mine should be provided with ladder ways as a means of exit in case of accident to shaft or hoisting machinery.

Sinking large shafts in swelling ground, in loose, watery, running ground, or in quicksand, greatly multiplies the difficulties and dangers of the miner. There are instances where shafts have been abandoned owing to insurmountable obstacles which a combination of engineering skill, capital and labor were unable to overcome, but such instances are of rare occurrence. Few shafts present greater difficulties than were encountered at Leadville, Colorado; in the Lake Superior region; in some coal mines; on the Comstock, and in Calaveras and Amador counties, California (the latter are mostly inclines), and some of the shafts in the regions mentioned are today splendid and substantial monuments to American engineering and to the enterprise of the companies owning them.

The shaft of El Capitan mine, Nevada county, now the property of the Providence Mining Company, was sunk through decomposed slate and altered dyke rock under the most trying and dangerous conditions. After several failures, the shaft was carried down to solid ground under the direction of Francis Burns, who worked slowly and carefully, giving the soft running ground time to drain. The water being pumped from the sump, after standing for a time, appeared to drain the ground, and it was found that by this means progress was much more rapid than when the work was hurried. "Breast-boards" were carried down until the dangerous places had been safely passed.

It is sometimes necessary in sinking large shafts to carry them down in sections by driving lagging or planks down in advance of the excavation. This is known as "fore-poling." The section is started at one end of the main opening and advanced several feet, the lagging being well braced. Considerable water will drain to this depression, making the removal of the ground from the remainder of the shaft much easier. By carrying one side of the shaft some-

what in advance of the remainder, in this manner, loose, wet ground can be worked more quickly and at less expense than when it is attempted to carry down the entire shaft at once.

In cases where sinking cannot be carried on in shafts much in advance of timbering, the wall plates may be spliced The better plan is to extend the plate from one side entirely across the two hoisting compartments, that portion in the pumping compartment being in a single piece, and joining the longer piece directly opposite the divider next to the pumping compartment. These joining ends of the two sections of wall plate should be framed so as to permit the divider to lap over their entire width, the upper half of the plate sections being removed so as to admit the upper half of the divider, as shown in the illustration.

The post standing immediately upon the divider, and covering the entire splice and overlap, prevents the divider from being blown out by heavy shots below. This plan also greatly facilitates the placing of shaft timbers, as there is not that great loss of time in getting the wall plates in position, which results when long timbers are handled. There is always difficulty and loss of time where the shaft cannot be carried down in advance of the timbers far enough to give room to turn the long wall plates. This system also permits of the renewal of wall plates and other shaft timbers by the ease with which they may all be removed.

(To be continued.)

The Situation at Grass Valley.

The miners held an enthusiastic meeting Sunday and showed their determination to resist Mr. Hague's attempt to cut down the wages in this county. The *Tidings* says the whole scheme has been hatching for some time. Mr. Hague has lots of property on Rocky Bar Hill and he wants cheap labor to open it up; for this reason he has ordered a reduction to take place at an early date. We are satisfied he will be balked. We understand thirty-two men have been laid off from the North Star mine. There are now so few left that to shut down the mine would be but little loss, and unless he will pay three dollars per day we say shut her down. The fight is not so much against cutting the wages in these two mines, but against establishing a precedent that will result disastrously to all. Let every miner join the Union and thereby strengthen that organization, as well as securing to himself and family a decent living. There are dozens of miners in this city who would be only too glad to lease either of these two mines on the tribute system and show the owners that they will pay, but Mr. Hague would rather close his mine down than do this. Yet he claims that the mines are not paying. Well, perhaps they are not, but that is not saying that they cannot be made to pay. Join the Union and save the reputation of Grass Valley as a fair camp.—Nevada Transcript.

A "Good Send Off" Promised.

Patrick Ragan was "blasted" in the Collamer mine on Tuesday, defective fuse causing a premature explosion. He says: "In a second after I lighted the fuse I saw that I was in for it, and began to scramble out. My foot slipped and I fell as the blast went off. I began to bleed terribly and got weak at once. I don't know how much blood there is in a man, but I think I lost about two gallons." He got out to the point of the hill and hollered lustily. R. T. Pierce fortunately heard him and called for a horse, upon which he placed the injured man and brought him to town, where his wounds were temporarily dressed. A man was started on horseback to summon a doctor, who arrived next morning. Pat is considerably bunged up, but being in perfect health otherwise, he will probably pull through. Though somewhat disfigured, he will be in the ring for a long time to come; but if, unfortunately, he should peg out, we will give him a good send off, such as his friends may be proud of.—Homer Mining Index.

A BIG GIRDER at the Broad-street station, Philadelphia, is 85 ft. long, 10½ ft. high and weighs 110,780 pounds. It is believed to be the heaviest and largest steel girder ever turned out complete by any iron works in the United States. It was made at Pottstown, Pa.

THE Calumet & Hecla Mining Company's latest dividend is $5 per share—half a million dollars. This mine has paid $40,850,000 cash dividends, the largest in amount of any mine outside of Nevada. The par value of the stock is $25, but shares when sold bring $290 each.

THE Colliery Engineer Company of Scranton, Pa., conduct a Correspondence School of Mechanics which, judging from extracts from letters written by students, is in every way a satisfactory success.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XI.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

In 1792, William Murdock of Redruth, Cornwall, England, made experiments with coal, wood, peat, etc., from which he made gas and successfully burned it in his house.

I find it recorded (Chemical News, Vol. XV, March, 1867, folio 109) that during a lecture in the new college of Hackney, England, about 1793, Doctor Priestly put a piece of coal into the bowl of a common tobacco pipe, which he inserted in the fire and ignited the gas, with the remark to his class that he had no doubt that some time this would be turned to an important purpose.

Natural gas—so called—was first discovered in the United States, near Charleston, South Carolina, in the year 1815, but no use was made of it.

As far back as 1817 William Maclure, the pioneer geologist of America, called attention to natural gas on the banks of the Great Kanhawa river in Virginia (Observations on the geology of the United States of America, 1817, folio 57) in the following words: "On the Great Kanhawa near the mouth of Elk river, there is a large mass of black, and I suppose vegetable earth, so soft as to be penetrated by a pole ten or twelve feet deep. Out of the hole so made, frequently issues a stream of hydrogen gas which will burn for some time, and in the vicinity of this place there are constant streams of this gas which, it is said, when once lighted will burn for several weeks. Query: If a careful examination of this place would not throw some light on the formation of coal and other combustible substances found in such abundance in this formation?"

1821.—At Fredonia, New York, a woman went with a lighted lantern at night to a spring for water; an issue of gas, before unknown, ignited with an explosion, to the consternation of the woman. This becoming known, attention was called to the remarkable spring and its emanation of gas. Soon after some was collected in a copper receiver and conveyed in pipes to a mill and several stores, in which it was employed for illumination. This was the first practical use of natural gas in the United States. When in 1824 Lafayette passed through the village, the hotel was brilliantly natural gas lighted in his honor.

1829.—A salt well near Burksville, Kentucky, spouted gas and petroleum, a thing never before known. This phenomenon is more fully described in the history of petroleum.

1859.—At East Liverpool, Ohio, a well sunk for water discharged natural gas in considerable quantity. The eruption of gas and petroleum in Kentucky thirty years before being forgotten, this was a surprise being quite unexpected. It was soon after turned to account and used in the town in manufactories. About this date the town of Bolivar was lighted by open pipes at the street corners.

1861.—Rouse's well was a large producer of petroleum, and much gas flowed with the oil, which is said to have settled in the neighborhood with the appearance of a fog. One day it is said to have exploded and a number of persons were killed.

1864.—About this date there were gas wells at New Cumberland.

1867.—While a well was being sunk within the city limits of Erie, Pennsylvania, a flow of gas occurred which nearly suffocated the workmen. Gas not being sought or desired, the well was filled in and another commenced which produced gas like the first. The importance of this discovery was not realized at the time, but some experiments were made by driving iron tubes deep into the mud and igniting the gas that flowed from them. Mr. Brevillier sunk a well on his premises for petroleum, which failed to flow, but, instead, a gas well was developed from which the precious fuel was allowed to go to waste for three years, after which time he laid pipes to his house and burned it very successfully; only one-sixth of the product of the well was utilized, the rest escaping from a safety valve.

1870.—In October, in Issaquena county, Mississippi, a well was sunk forty feet deep in the so-called bottom or made lands which produced gas very much like that of Stockton in California. The flow was small.

1871.—In February a well was sunk at Buffalo, New York. At 318 feet a vein of natural gas was met with, but the flow was inconsiderable. It was then sunk 312 feet deeper, when salt water was ejected by gas pressure. After pumping for a time, gas flowed freely through a two-inch pipe and burned well, although the light produced was inferior. In burning in the gas works for fuel, it was found necessary to use coke with it.

The average depth of gas wells in Erie, Pennsylvania, was 600 feet, the average cost $1500, and the yield from 10,000 to 20,000 cubic feet daily. The gas was used for fuel and lighting to great advantage. Senator Lowry of Erie from a private well supplied fourteen fires in his dwelling and the chandeliers in the different rooms, besides which he warmed the cellar, used as a laundry.

A well sunk in Painesville, Ohio, only 550 feet deep, yielded "an enormous volume of gas." During this year the average price of coal delivered in Pittsburg was $2 per ton.

The city of Erie was lighted by natural gas. One well put down by the city gas company flowed 24,000 cubic feet daily.

Near the mouth of the river Hockhocking, Ohio, at the depth of 600 feet, a crevice was struck in a well being sunk, from which issued a stream of gas "unparalleled in all the oil explorations in the country." This well gave out also salt water and oil intermittantly, the gas throwing them 100 feet high. A pipe from one of the wells being ignited, it burned with a jet of flame twenty feet long and as large as a hogshead. A stop cock placed on the pipe caused the pressure to rise to 180 pounds. The gas was pure and was thought to be sufficient to light a large city. Professor Newberry, in the *American Chemist*, estimated the yield to be 10,000 to 30,000 cubic feet daily.

1872.—The Newton gas well struck gas which was piped to Titusville and used as fuel and for illumination. This was the first natural gas plant in the country. The diameter of the first pipe was two inches, which was soon replaced by one of three and one-quarter inches.

1874.—Natural gas was used for the first time in Leechburg, in the manufacture of iron by the firm of Rogers & Birchfield.

1875.—After many failures the first successful attempts were made to shut off the gas in the pipes. The pressure at that time was not nearly so great as it became soon after.

1876.—A six-inch pipe line, seventeen miles long, was laid from the Harvey gas well in Butler county to Sharpsburg, and the gas used successfully in the Etna mills of Spang, Chalfant & Co.

1878.—A well was being sunk for oil eighteen miles east of Pittsburg, Pennsylvania. When it had reached a depth of 1620 feet a sudden and violent explosion took place. The derrick was blown away and a gush of gas began to escape with a roaring sound, heard for miles. After the first surprise, pipes were connected with the well and the gas was ignited. It was found to burn with great brilliancy, but for five years it was allowed to go to waste, after which it was conducted in pipes to Pittsburg and very successfully burned as fuel in steel works of that city. During the same year the oil wells at East Liverpool, Ohio, were considered one of the wonders of the world. In and around the city illuminating gas cost practically nothing. The street lamps burned day and night. It cost more to put them out and relight them than the gas was worth. The entire fuel of the town was natural gas. It was used in dwelling houses, and in twenty-two potteries employing 2,000 workmen. The first gas well, opened in 1859, was still producing.

1882.—The United States Government commenced publishing statistics as to the production, or rather the consumption, of natural gas in the country. What was produced can never be known, for most of it went to waste. These data were obtained by estimating the quantity and value of the coal displaced by gas. This year it amounted to $215,000.

About this time some oil drillers were sinking a well in Washington county, Pennsylvania, the object of which was to discover petroleum oil. On reaching the so-called "oil sand" a flow of gas commenced instead of the expected oil. By the escape of the flowing gas the drills were blown out with great force and the elastic vapor left the pipe with a roar, "the like of which was never before heard." Gas then being considered of but little value, although sometimes occurring in considerable quantity in oil wells, the drillers waited for several weeks with impatience, hoping and expecting the gas would become exhausted and oil follow. But they were disappointed. This was the afterwards celebrated McGugin gas well. The gas was ignited, and burned for months. It was considered a curiosity and was visited by many persons. Other wells in the vicinity sunk for oil produced gas, which was in a like manner allowed to go to waste, until at Pittsburg, near which similar wells were developed, the gas was utilized to a limited extent and found to be both cheap and convenient, upon which an excitement began in favor of the new fuel, which culminated in a general mania, followed by the usual formation of stock companies. In the beginning of this year the entire capital invested in natural gas in the entire country was only $150,000, but in two years it increased to $1,500,000. A well at Olena, Ohio, discovered in 1877, continued to produce gas for four years, when it became inactive and dwindled to a common and not very productive oil well.

1883.—The value of gas consumed in the United States was $475,000.

(To be Continued.)

Treating Rebellious Gold Ores.

The Beam process for treating rebellious gold ores, now in operation at Telluride, Col., is thus described:

A crusher, ten stamps, ovens and amalgamators are employed as follows: The ore, after being crushed, passes over a drying oven to the stamps and is crushed dry. The battery is open on both sides and the ore comes through a twenty mesh; it is then conveyed to sixty mesh over a hopper. All the ore that will not pass through this is returned to the stamps. From the hopper it is delivered on top of the furnaces or ovens, where it is mixed with the proper amount of salt and sawdust before it enters the roaster. After being roasted it is conveyed to the cooling floors; from there it goes to a grinding pan and is again ground liner. It then passes into the amalgamator, and when it leaves the amalgamator it is caught in a bag for the purpose, which takes the place of buckskin or chamois.

On top of the ovens are tubes or pipes to convey all the fumes that arise from roasting; these fumes pass through water, which condenses them, so that nothing is lost.

The ovens are 8½x46 feet, and in their construction two broad gauge and three narrow gauge cars of fireclay were used.

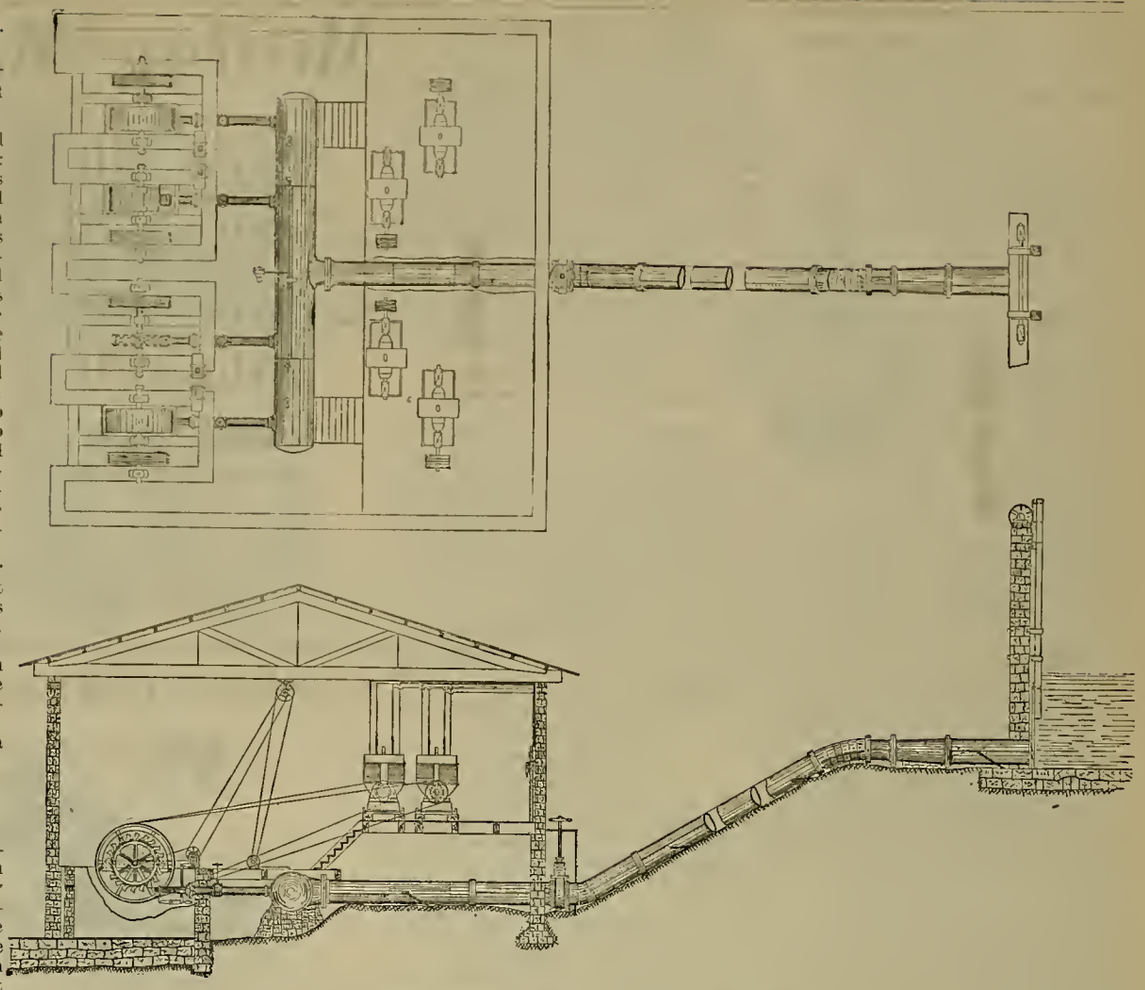
The entire plant is enclosed in a building 40x120 feet.

Not Good Policy.

We remember, says the Nevada *Herald*, that a few years ago a certain mine had been held for sale at a very reasonable figure. It was in a condition that it would require considerable money to develop it—scarcely more than a good prospect. A gentleman from this county went below and got some parties to come up with a view to buying the claim. When the owners found that there was a chance to sell, the price was raised to almost double the former price. The result was that the parties returned to San Francisco without so much as looking at the claim, and the person who brought them up was left with a great disgust on.

Nobody denies that the owner of a claim has a right to put any price upon it that he sees fit, but the question is, is it good policy to hold claims at the price that the mine is worth when it is opened? Is it good policy to raise the price just now when money is seeking investment in the mines? We think not.

Electric Power Transmission in South Africa.



WATER-POWER PLANT IN SOUTH AFRICA.

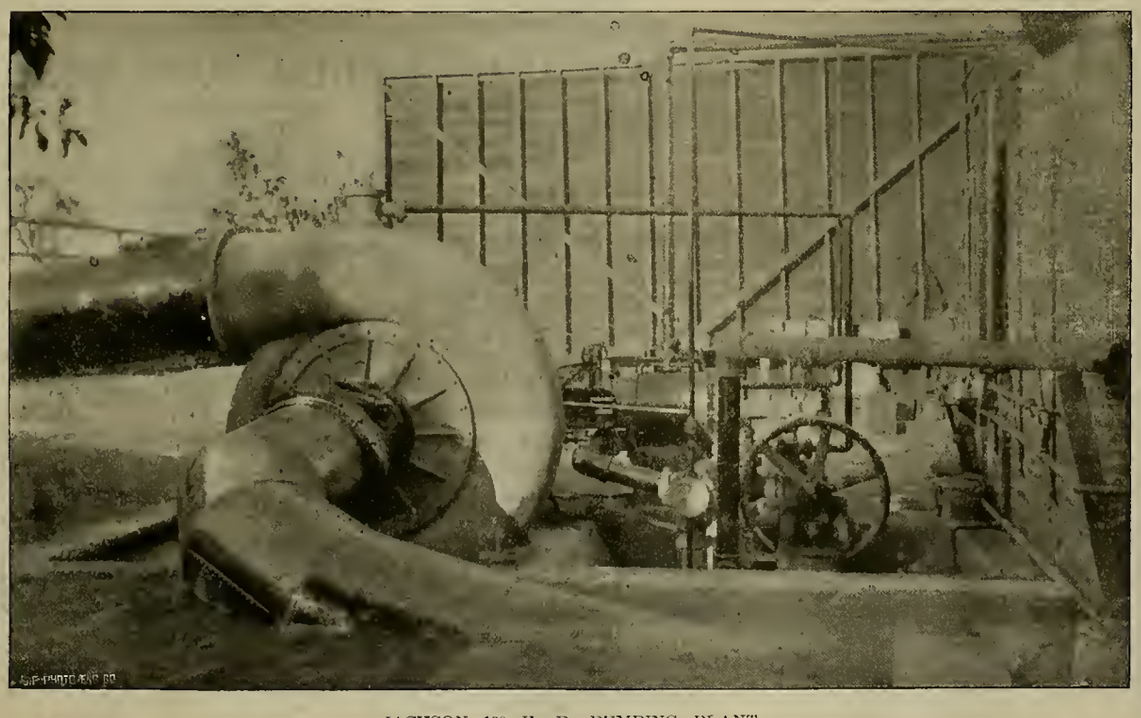
The above illustration shows a water-power plant furnished by the Pelton Water Wheel Company a year ago for the Moodies Gold Mining & Exploration Co., in South Africa. This plant is located on the Queen's river, near Barberton, and consists of four 125-horse power Peltou wheels run under 142-foot head at 150 revolutions.

The electric generators—four in number—are driveu direct from the water wheel shafts by rope sheaves six feet in diameter, grooved for five 1½-inch diameter ropes. The power thus generated is transmitted to the mines of this company—a distance of about five miles—and used for mills, hoists, concentrators, etc.

This plant has now been running about six months, and is understood to be an entire success from every point of view. A number of other stations of similar character are contemplated in the Transvaal—some of large power involving much longer transmission. This section not being very well provided with streams available for power purposes, resort is being made to electric transmission wherever possible.

Ambulance for Mine Use.

The difficulty of carrying injured men in mines through narrow and uneven passages has often been recognized. An apparatus inveuted by Dr. Paul Troisfontaines is described by the *Semaine Industrielle* of Brussels, and seems to be simple and convenient, as well as cheap. It consists of a sort of hurdle or litter made of hoops about eight mm. in diameter, placed parallel and joined by a fabric of cord or mat, somewhat like a hammock, thus giving when required rigidity in one direction and flexibility in the other. The injured man is laid in the litter with his legs extended and his arms at the side of his body; the upper part of the litter is then folded over and secured by three or four straps. The man then forms a package, and can be carried without the slipping and jolting of an ordinary litter, no matter how narrow or rough the workings may be. In case of fracture there is believed to be less danger in carrying a man in this way, holding him immovable, than in attempting to keep the broken limb in place by rough splints or bandages extemporized on the spot. These litters can be easily stored in a small space.



JACKSON 100 H. P. PUMPING PLANT.

Reclamation of Land.

The reclamation of land is going on at Randall Island, on the Sacramento river, where a large area of land is being converted from a marsh to productive soil. The accompanying illustratiou is of a Jackson 100 H. P. pumping plant, from a photograph taken while the pump-house was building and the plant at work.

THE German army has recently been testing paper horseshoes, and found their lightness and elasticity made it possible for a horse to travel "faster and farther without fatigue than one shod with iron." They are impervious to water "or other liquids."

Scientific Progress.

Invisible Worlds Beyond the Stars.

Let the photographic eye continue to observe in place of the human eye, it will penetrate the unknown. Stars invisible to us become visible to it. After an exposure of thirty-three minutes, stars of the fifteenth magnitude will have finished their task of impressing the chemical retina and placing there their images. The same instrument which to the human eye reveals stars of the fourteenth magnitude, and which would register about forty million stars in the entire heavens, discloses to the photographic eye 120,000,000, including only those of the fifteenth magnitude. It could reach forth to the sixteenth and throw before the dazzled admiration of the observer a luminous maze of 400,000,000 stars.

Never before in all the history of mankind have we had in haud the power to peuetrate so deeply into the abysses of the infinite. Photography, with its recent improvements, takes a clear picture of every star, no matter what its distance, and sets it down in a document that can be studied at leisure. Who knows if some day iu the photographic views of Venus or Mars some new methods of analysis may not discover to us their inhabitants? And its power stretches forth to the infinite. Behold a star of the fifteenth, sixteenth or even seveuteenth magnitude, a sun like our own separated from us hy so great a distance that its light requires thousands, perhaps millions, of years to reach us, notwithstanding its unheard-of velocity of 300,000 kilometers a secoud, and this sun lies at snch a depth that its light, so to speak, reaches us no longer. The natural eye of man never would have seeu it and the human mind never would have guessed its existence but for the implements of this modern art. And yet this feeble light, come frou so far, is sufficient to make an impression upon the chemical plate which will preserve its picture unalterably. This photographic plate takes us back to the past history of the universe. During the ethereal flight of this ray, which comes to-day to beat upon the plate, all the history of the earth has been accomplished, and in this history that of humau kiud is but a single wave—an instant. And during this time the history of the distant suu which photographs itself to-day has heen accomplished also; perhaps it became extinct long since; perhaps it is actually out of existence. Thus this new eye, which transports us across the infinite, enables us at the same time to trace the periods of past eternity. Yes, many of these far-away suns that we are goiug to such pains to photograph no longer exist. The end of the world has come to them as it will come to us; and the luminous couriers that they sent us before dying travel forever. Astronomy plunges us into the insoluble mystery of the iufinite and of eternity—and therein lies its grandeur.

Science in Soap Bubbles.

There is scarcely anything in the world which seems more utterly outside the realm of law than a soap buhhle. The delicate film, with its exquisite floating colors, its power of instantly vanishing, leaving no trace behind, hardly seems as though it could form a liuk in the inexorahle chain of cause and effect which we call physical law.

The atmospheric pressure on a buhhle six iuches in diameter is over 1500 pouuds, and yet the fragile film lies safely between the opposing forces of nature—the pressure of the outer air, the spring of the enclosed cushion withiu it, the downward pull of gravity, the upward push of the buoyant atmosphere and the molecular forces iu the film itself—so long as the bubble lasts; it is because of an exquisite adjustment of all the forces, physical aud molecular, concerned in its existence.

This is, of course, the merest commouplace, and yet it is one of the commouplaces of uature which, however well we may know them, never cease to he wonderful when they are in any degree realized. There are other laws governing films which are no less wonderful, though they are less familiarly known. A heap of bubbles blown while the pipe is dipped under the surface of soapy water looks like a chaotic huddle of hubbles of all sizes and many shapes; but, upon carefnl examination, it is found that never more than three films meet at an unsupported liquid edge, and never more than four edges meet at a liquid point, and that the angles are always equal; that is, films will not meet each other at an unsupported edge or point at an augle smaller than 120°—oue-third of a circle.

Electricity and Earthquakes.

Prof. John Milne, of the Japanese Imperial University, in a recent article in the *Seismological Magazine*, says that the results of experiments and investigations on a possible connection between earthquakes and magnetic aud electric phenomena do not allow us to admit any such connection. It is uot likely that earthquakes ever result from electric disturbances, and it has not yet been proved that they ever give rise to any such, though when large masses of rock are displaced, as in Japan in 1891, slight local changes in magnetic curves have resulted.

Under the Earth.

The workmen in the deepest mines swelter in almost intolerable heat, and yet they have uever penetrated over one seven-thousandth part of the distance from the surface to the ceuter of the earth. In the lower levels of some of the Comstock miues the men fought scalding water and could labor only three or four hours at a time until the Sutro tunnel pierced the mines and drew off some of the terrible heat, which had stood at 120°. The deepest boring ever made, that at Sperenherg, near Berlin, penetrates only 6702 feet. While horings and mines reveal to us only a few secrets relating solely to the temperatnre and constitntion of the earth for a few thousand feet below the surface, we are able, by means of volcanoes, to form some notion of what is goiug on at greater depths. There have been many theories about the causes of volcanoes, but it is now geuerally held that, though they are produced hy the iuteuse heat of the iuterior of the earth, they are not directly connected with the molten mass that lies many miles helow the immediate sources of volcanic energy. Everybody knows that many rocks are formed on the floor of the oceau, and it has heeu fouud that a twcutieth to a seventh of their weight is made up of imprisoned water. Now, these rocks are huried in time under overlaying strata, which serve as a blanket to keep in the enormous heat of the interior. This heat turns the water into superheated steam, which melts the hardest rocks, and when the steam finds a fissure in the strata ahove, it breaks through to the surface with terrific energy, and we have a volcano. We find that these outpourings that have lain for countless ages many thousands of feet helow the surface are well adapted to serve the purposes of man. Many a vineyard flourishes on the volcanic ashes from Vesuvius, and volcanic mud has clothed the hills of New Zealand with fine forests and its plains with luxuriant verdure. The most wonderful display of the results of volcanic energy is seen in the northwestern corner of our own land, a region of lofty forests and of great fertility.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Mechanical Progress.

The Cost of an Indicated Horse Power.

A paper with this title was read at the recent Montreal meeting of the American Society of Mechanical Engineers by De Courcy May, who summarized his subject in the following table, showing the total cost of one indicated horse power per annum for various engines:

Kind of engine.	305 days of 24 hours. Coal per 2240 lbs.				308 days of 10½ hours. Coal per 2240 lbs.			
	$2	$3	$4	$5	$2	$3	$4	$5
Triple-expansion, pumping, Allis, 30 revs	18	55	61	67	31	33	35	37
Triple-expansion, without pumps, Allis, 50 revs	27	33	39	45	16	18	20	22
Compound mill, best engine	29	36	41	51	17	19	21	24
Compound mill, average	39	46	52	58	22	25	28	31
Compound electric light average	122	133	159	171	78	81	100	96
Compound trolley	18	58	68	70	29	32	36	39
Triple-expansion trolley	45	54	61	74	26	29	33	35
Condensing mill	45	52	61	69	25	28	33	38
Non-condensing, 50 to 300-horse power	70	76	81	88	40	53	57	60

The figures for engines below 50-horse power vary so widely that they have been omitted. The above table has been calculated as far as possible from actual engines running under ordinary conditions, but it is not pretended that the figures represent true average values, the compiler not having been able to collect information from a sufficient number of cases. The engines are nearly all high-class and of large powers. The figures in the table are therefore rather below than above the average.

Fuel Oil in Concert Valley.

The fuel used in the steam plant at the recent Midwinter Fair was crude petroleum. This plant constituted the entire steam power, consisting of eight Heine sectional boilers of 357 h. p. each, arranged in two groups of four. Each boiler had one large furnace nine feet one inch wide, sixteen feet long and five feet high, with four doors and draught openings. Crude petroleum was used as a fuel, and to adapt the boilers to this the bridge walls and grate bars were removed and the entire bottoms of the furnaces covered with fire-bricks. Pieces of fire-brick also were thrown in to make a mass that would retain heat for a considerable period. The bottom of the furnace was much lower than would be the case with coal as a fuel, the large capacity being necessary as the combustion was entirely in the form of flame. The door openings were closed with a screen of loosely laid red bricks, except an inspection hole about three inches square, and the screen effectually prevented loss by radiation. Each boiler was fitted with eight Graves' burners similar to those used by the Heine Company at the Chicago Exhibition, but better results were obtained in this city. The burner consisted of a cast iron tubular body screwed into the furnace front. The oil was carried through a tube placed axially in the apparatus and discharging by a hole one-eighth inch diameter. Steam entered at the side about the middle of the length of the casing and passed out through an annular opening around the oil jet. The jet of steam was made to take a rapid spiral motion by means of rifle grooves in the casing. The discharge openings for both oil and steam were adjustable by serewiug the parts into one another. When no steam was ou, the oil was discharged with sufficient force to throw a stream four or five feet into the furnace. The oil entered the apparatus through a pipe one-fourth inch diameter, under a pressure of twelve pounds per square inch. Steam entered through a pipe one-eighth inch diameter, full boiler pressure being used. The oil became completely evaporized, and no combustible matter was left in the furnace or tubes.

Outside the boiler room a large pit was dug and lined with wood, and in this were plaeed two iron tanks, each holding 7500 gallons. Tank ears were run to the pit and the oil piped into the receiving tanks. About 4000 gallous were used every day.

In the space between the boilers were placed two Dow pumps, size B, which supplied the oil to the boilers. They had suctions four inches diameter, and each could supply fuel for 4600-horse power of boilers. One was kept as a reserve, and for the light loads a smaller pump was used. The pumps discharged into a vertical tauk twelve inches by six feet against an air pressure of twelve pounds per square inch, maintained constantly by means of a pump governor controlled by the air pressure and shutting off steam to the pump as soon as the air pressure rose. There was a constant slight leak of air which was compensated for by a shifting valve on the pump.

The whole arrangement is described by an exchange as being so automatic that, during the hours of heaviest loads in the evening, only two men were required, one to look after the oil supply and the furnace and the other for the water; while during the rest of the twenty-four hours, from midnight until 6 P. M., one man easily took charge of the whole. No dirt being present, the boilers were painted white and remained so. If coal were used, six to eight men would have been needed. From midnight to about 6 A. M. the average load was about 200 h. p.; during the day from 800 to 1000 h. p., and during the heavy-load period in the evening 2500 h. p. The oil discharge from the pressure tank was three inches in diameter until it reached the line of the boiler fronts, where it divided into two pipes each two inches diameter and feeding four boilers.

Educational.

Belmont School,

BELMONT, CALIFORNIA,

25 Miles South of San Francisco.

BUILDINGS heated from a central steam plant, and buildings and grounds lighted by electricity.

BOYS perform their own experiments in well-equipped chemical and physical laboratories.

GYMNASIUM 30x70 feet, furnished with very best apparatus, including shower baths, under special teacher of physical culture.

SCHOLARSHIPS for young men of fine character and ability. Accredited at Stanford and at the University of California in all the subjects of all the courses and in advanced physics, chemistry and mathematics.

REFERENCES required. Views of Belmont School and Catalogue sent by applying to W. T. REID, A. M. (Harvard), Head Master.

ACTUAL BUSINESS PRACTICE.

Established 1863. **PACIFIC Business College, 320 POST ST. SAN FRANCISCO.** Day and Evening Sessions.

Rates of Tuition Very Moderate.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, President.

HEALD'S

Business College,

24 Post Street, - - - San Francisco.

FOR SEVENTY-FIVE DOLLARS

This College instructs in Shorthand, Type-Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils. Our school has its graduates in every part of the State. Send for Circular. C. S. HALEY, Sec.

INVENTORS, Take Notice!

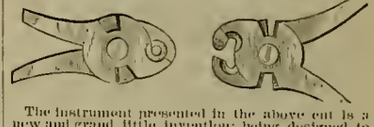
GIANT POWDER FURE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded fuses where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight.* There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOODEY & SHERWOOD Fresno, Cal.

BOOKS ON ASSAYING.
By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

The Russell Process.
For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to
THE RUSSELL PROCESS CO.,
Park City, Utah.

J. F. CROSETT,
Commission Mine Broker,
628 SACRAMENTO STREET.
I have five customers looking for income-paying mines for London, to be valued from $300,000 to $5,000,000. I also want ten income-paying properties for customers residing in San Francisco, Chicago, Denver, New York and Philadelphia. Owners of mines desiring to sell can make quick sales by seeing or writing me. I also invite investors to consider properties I have to offer.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

Herald: Wm. Osborn and Thomas Hardy, owners of the Bolitho mine a mile south of town, struck a five-foot ledge of good milling rock last Saturday, which has since improved greatly in richness.

The men working at the Mayflower mine near Murphys, who have about two months' wages due them, have received information that their pay is forthcoming. The mine is operated hy the owners of the Calico mine in San Bernardino.

BUYING MINING PROPERTY.—Angels *Herald:* James M. Jackson is here showing representatives of the Sierra Buttes Mining Company the Deer Lodge Consolidated gold mine, at Collierville, five miles east of Murphys, near the Stanislaus river. It consists of four full claims and has a water right of 3000 inches. Three of the claims are on one ledge and the fourth is on a parallel ledge. Although the mine has heen worked considerable, it is still very rich. The manner in which the Sierra Buttes Company intend to operate will enahle it to declare a dividend from $2 rock. It proposes to work the mine by water power and run a tunnel end on the ledge, therehy making sinking, hoisting and pumping unnecessary. A mill of 100 stamps will he put up, if possihle.

The representatives of the Sierra Buttes Mining Company who are here are the president and three of the directors, and have recently come to this country from London.

The company own the famous Sierra Butte and Plumas-Eureka mines, also the Uncle Sam mine in Shasta county. A purchase it has just made in Mariposa county is the Whitlock and Westward mining claims, the Whitlock, Spencer and North Whitlock mill sites, and the water location of A. H. Ward on the Merced river. Ahout 240 acres of land were conveyed in the transfer. The Spencer, Alahama and a numher of other mines contiguous to the Whitlock have been bouded by the same company, and they will probably he purchased hefore the expiration of the honds.

The company have also been endeavoring to purchase the Blair mine here, and agreed to pay $300,000 for it if it was satisfactory, but it was sold for that sum to other parties who had spoken for it first.

Humboldt and Trinity.

Advocate: J. H. D'Orsay and A. Colhurn bave crossed the Trinity summit, the Salmon summit, visited the New River mining camp, Hyampom and Elderpom valleys and the Trinity and Salmon rivers.

Eldepom is a large valley lying between the south fork of Trinity and the main river, and hig enough to accommodate 500 prospectors. Carroll creek, which has four tributaries, flows through the valley; a helt of gravel from half a mile to one and a half miles wide extends the entire length of it. It is thought that miners with ordinary sluicing could make all the way from one to three dollars a day there.

The people of that section do all in their power to discourage mining operations in the valley for the reason that they want their stock to have access to it.

At New River a great many prospectors were found, who, in most cases, were at work on old abandoned diggings. They seemed to be doing well. Messrs. Fulmore, McDowell and Leas have taken some good rock out of their new claim and are getting it in shape to sell to some syndicate with the requisite capital to develop it. Oliver Baker of Fortuna bought a little while ago an old claim on the river har for $25, and the first day took out $9.50 in gold

Inyo.

SOUTHERN INYO.— *Register:* Work on the Wilson & Co. property, eight miles south of Postoffice Springs, in the Panamint range, is progressing.

In Panamint P. Gallagher is at work on a small vein of high-grade silver ore. The ore works in San Francisco $600 per ton, hut under the existing price of silver is a hard horse to eurry.

At Wild Rose, Kennedy & Danielson are at work on the Mammoth leads of antimony. Could capital he induced to take hold of this property, it would be one of the greatest bonanzas in southern Inyo. On the dumps there are 150 tons of ore from 50 to 65 per cent antimony, and an ahundance of ore in sight.

In Mountain Spring canyon James C. Prewitt and partner have opened up a fine gold property. This mine had been abandoned years ago and considered worthless. These men relocated the mine and sunk a new shaft; have ore working from surface. Down 100 feet found ore working $80 per ton in the arrastra, and have two feet of ore that works $25 per ton. Capitalists have interested themselves and the owners are about to make a sale for $16,000.

Stiles & Mills, about six miles east from Mountain Springs, have a group of mines that they have been at work on constantly for the past two years. This ore carries hoth gold and silver, and the prospects are a mill will he erected soon on the property.

Mr. Meredith and John Curran have struck a rich vein of gold ore in the Slate Range country, the ore going $200 per ton in free gold.

THE CASEY.—This mine, the property of the Inyo Gold Mining Co., ahout eight miles northeast of Bishop, is steadily producing ore of a fair grade. The five-stamp mill is now at work on a run amounting altogether to 130 tons of ore. Work will shortly be begun on a vertical shaft to tap the ledge at a depth of about 130 feet, and hoisting works of some kind put on. It is probable that in the very near future a $1200 cyanide plant will he put up hy outside parties to work the 3000 tons of tailings at the mill.

TOO MUCH WORK.—*Index:* Baldwin Bros., late of San Bernardino, came in from Mazurka on Sunday with about four ounces of nice gold dust, the result of several days' work with their dry washer. There was too much work for the pay and they will not return.

Nevada.

The Champion mine will soon he in full swing again. The hoisting gear and tracks are heing inspected and everything put in first-class shape, preparatory to working the mine on a more extensive scale than ever. When work stopped, at the time the injunction was served on the Champiou Company, the lower levels were in good conditiou, being well timbered and the loose dirt and rocks being otherwise kept in restraint. As the months wore on the walls hegan to crumble and when the mine was explored a short time ago it was found that numerous chutes and drifts had caved in and the passages were otherwise hlockaded with loose material.

The Merrifield, another property owned by the Champion Company, is looking splendid at the present time and from indications it has a great future. There are about twenty-five men at work in and around this property, all that can he employed at present. The company is about to erect a mill on this property to crush the ore coming from the mine. It is now being crushed at the Champion mill. Two hundred men will be employed in the Merrifield and Champiou mines withiu the next few months.

THE GOLD POINT.—Superintendent Bennallack informs the *Union* that within the next two months one of the hest and most approved ten-stamp mills in the State, with Johnston concentrators, will be in operation at the Gold Point mine on Union Hill. This explains tbe levying of the twelve-cent assessment.

The Gold Point was cleaned out and some ore extracted this spring and the returns were so satisfactory that the company has come to the conclusion to open up the mine and push work vigorously. There are 10,000 tons of ore ready to he stoped out, besides some on the quartz dump. It is expected, judging from past crushings, that it will pay $6 per ton, and it will cost hut $1.50 to extract and crush it. This, consequently, admits of a hig profit.

The shaft is down 175 feet. The location is 2630 feet in extent, and there is a mill site of five acres.

Work will he commenced in a few days, and under Superintendent Bennallack's able management the property will be rapidly developed.

San Diego.

RICE MINING DISTRICT.—*Union:* The new Rice mining district a few miles east of Warner's ranch in this county promises to become the scene of permanent activity. The few mines already discovered there hy J. B. Rice, cne or two of which have shown signs of developing into first-class properties, have attracted other miners to this locality, and location notices aie now being received hy the county recorder almost daily. Yesterday notices were filed of the Bonny Bell mine, by Chatham Helm; the Sarah mine, hy Sarah A. Wright; the Good Luck mine, hy M. Rice and others; the Oelavie mine, hy J. P. Higgins and others; the Ellen mine, hy J. B. Rice and others, who also filed a notice appropriating 100 inches of water in Grape Vine springs, with five acres of land for a millsite.

Sierra.

THE EMPIRE MINE.—*Messenger:* The new owners of the Empire mine, in Gold Valley, are going to work with a will aud as if they meant business. There are now about forty men working at that place, over two-thirds working on the roads and in the woods. We understand that no attempt will be made to erect chlorination works this fall, as the season is too far advanced, hut that the company will devote its time to the fixing up of the sawmill, cutting lumher and prospecting the mine. The company has purchased the quartz mill on the Garibaldi property, ahout a half mile below the Empire, and will remove the machinery up to their own mine as soon as a road can he huilt, so we are told. The success of the Empire will mean a big help to Downieville.

The machinery for tbe Gold Bluff electric plant is on the way up from helow, and it will he put in place as soon as it arrives. It will he a hig saving for the company when it is in working order.

The Empire mine at Gold Valley will run their machinery hy electricity. They have plenty of power right at hand to run the dynamos, and it will he cheaper and more satisfactory in every way.

CONSIGNMENT OF MACHINERY.—*Union:* A large amount of machinery for the Golden King and El Capitan mines at Allcghany was transferred over the Narrow Gauge railroad last night. The new mill at the Goldcn King will he ready for operation next month, and the mill will be one of the finest in Sierra county.

San Bernardino.

A FORTUNE IN SILVER.—*Herald:* The impression which prevails that silver mines do not pay to work at this time is rather disproved hy the assertion made by C. W. Maxson, who returned from Keeler a few days ago. From him it is learned that D. C. Lane of Pomona purchased the Sorba mine last August, since which time he has actually put in the bank $35,000 and now has 100 carloads of ore on the dump worth $1000 a car. He has done this while developing the property, with no real intention of working the mine. Mr. Maxson says this is a fact which can he proven. It shows a pretty rich couditiou of silver ore, certainly. It is in this same district where Bellshaw & Beaudry took out $17,000,000. That was away hack twenty odd years ago. Remi Nadeau, for whom thc hotel in Los Angeles is named, also made money out of the camp by hauling ore and bullion to the nearest shipping point. At present, however, nothing hut the richest ore is shipped, as it costs $8 a ton to baul it to San Francisco, and another $8 to treat it after it reaches the smelter.

Tulare.

GYPSUM.—The Visalia *Delta* says: We have the purest gypsum in California, in inexhaustible quantities; there are two veins of terra cotta clay that can he traced several miles; there is a lead of graphite; coal croppings have been found at different places, and, last but not least, Martin & Goff have located a claim of red mineral paint. The ledge is 1500 feet long and almost inexhaustible. The paint is said to he of excellent quality. They have also located a copper claim which promises to be very rich in copper; also, a silver claim which tbey have tried, and from one pound of ore ran a 44-caliber bullet of silver. They have found a tin mine also. There has been no analysis made of any of their ores, but they will soon know what they have. Should these finds amouut to anything we may yet live to see this county inhabited by industrious citizens, and otber industries may spring up where we least expect them.

Siskiyou.

MINING NOTES.—*Journal:* The Spaugler Bros., at the mouth of Humhug creek, are getting ready to work the bedrock ehannel farther up the stream, to whicb point tbe derrick engine and pump will he removed this week. They have been taking out rich pay lately, aud when the open cut is made farther up will no doubt take out a great amount of gold, the hedrock being about 28 to 30 feet below the surface.

The Benz Bar claim at Houolulu, worked hy a Cbinese company, is said to be paying very rich, although it is hard to fiud out much from tbe Cbinese. This claim paid $140,000 a few years ago in sixteen months, on the opposite side of the river from Honolulu, and is now being worked on the Honolulu side.

The Beebe Bar, Conteunial, Fort Joncs aud several other claims along the Klamath river, from the mouth of Humbug creek to Honolulu, are reported as paying haudsomely.

The quartz mill at the Schroeder mine on Deadwood mountain, ahout nine miles south of Yreka, is kept steadily at work day and night in crushing a large quantity of ore on hand, which is paying well. The owner has a large force at work getting out more quartz, and the wood contractor has a large pile of wood to keep the engine moving, and is constantly hauling more.

NEVADA.

Washoe District.

The 1000 level of the Consolidated California & Virginia mine, which is heing worked through the old Consolidated Virginia shaft, is closed dowu. The works are stripped of air pipes, car tracks and everything that can he taken from them profitahly, aud all tools are removed. Operations on that level began the first of '94 under the "Rule contract," Rule undertaking to open a body of ore within six months. He failed, and after the expiration of his contract the Con. Virginia Company continued to prospect the ground traversed hy Rule's main drift. According to the weekly reports from the mine, no deposit of ore has heen found, and the company has concluded to suspend operations on tbat level in order, presumahly, to apply the money heing expended there at more promising points in the mine. The block of ground containing the ore hody recently found on the 1650 level will prohahly be given greater attention. The way this ore hody has continued to spread out indicates that its ramifications have not all heeu uncovered as yet, and that room for prospecting ahove and below it remains.

WHITE PINE COUNTY.—Men are at work on W. D. Campbell's mine in Steptoe valley. The ledge is eighteen iuches wide, and washes show the ore to carry from $80 to $100 in gold.

LINCOLN COUNTY.—*Record:* Messrs. Shean, Godhe and Lloyd have all machinery in good working order at the summit and will start leaching the tailings that are there. A test of the ordinary hypo gave the hest extraction and that will he used in the working of the same. They have every confidence of success from all the tests made, and will work on an average fifteen tons a day. They have gone to considerahle expense, and it is hoped that their greatest expectations will be realized.

SATISFACTORY.—Reno *Gazette:* Dr. Patterson is elated over the prospects of the Reno Borax Company, at Granite Point, this county. The first clean-up the company has made is 900 pounds of horax. The company has an expert borax and soda man—B. F. Gray—as superintendent of the works, and expects to develop a new industry that will pay.

OREGON.

JOSEPHINE COUNTY.—Rosehurg *Review:* K. B. Ireland has returned from his trip to Josephine county. He located some sixteen mining claims for two companies while there, and will soon return to hegin operations. These claims are situated on Althouse creek about forty miles from Grant's Pass, the ground along that stream having heen the richest in Oregon forty years ago when Mr. Ireland first mined there. The hars have already heen worked over as many as five times, and Chinamen are still washing away there. What he and his associates now propose to do is to work the henches and higher ground hordering the creek. They will first have to construct a three-mile ditch which will give them an abundance of water the year round.

JACKSON COUNTY.—J. L. Coyle of Henley, says the Ashland *Tidings*, reports that Wm. Rummel and George Parsley found a rich pocket of gold quartz recently on Ash creek, a tributary of Klamath river, ahout eight miles below Hornhrook, from which they cleaned up $1500 with a hand mortar in one week. Tbey are on tbe bunt for another pocket and have good prospects of finding it. A miner named Reader has mortared out nearly $10,000 during the past eighteen months from a small quartz ledge wbich he has located just across the river from Asb creek. He calls his claim "Fool's Paradise." About a year and a half ago he struck the first pocket and took out $4000. Since then he bas found hunches which yielded as follows: One each of $150, $300, $3200, $1790, the last amount being cleaned up by himself and another man in eight days in August. The gold is found in kidneys or pockets lying between tbe quartz and the porphyry.

WASHINGTON.

"At the new camp of Monte Cristo, in the Cascade mountains, north of Seattle," says D. H. Gilman, "some large quartz mines have been opened. There are a numher of silver properties that are also turning out well. The ore from this new district is concentrated at the mines and then shipped by rail to the town of Everett, on the Sound, where a smelter with a capacity of 500 tons a day has just been completed. Besides these mines some gold properties bave heen opened near Wenatchee, on tbe Columbia river. In one place tbere a mine belonging partly to Judge Burke has been opened that has developed an enormous quantity of quartz. It only runs $8 a ton, but there is so much of it that, like the Douglas Island and Homestake mines, it promises enormously. Over the State there is much interest in mines.

IN THE CASCADES.—On the line hetween Okanogan and Wbatcom counties a placer prospector recently discovered some float quartz and followed the signs up the mountain streams. Finally he lost all trace of it on the surface and began digging, with no indication of a ledge in sight. He was rewarded, he says, by pay dirt from the grass roots, with rich decomposed quartz intermixed. At a depth of five or six feet he struck a ledge of rotteu stuff that showed free gold all through. The ledge was crosscut and its width determined at 19 feet. The discoverer and his partner are operating a rocker on surface dirt and are said to be cleaning up $50 a day.

STEVENS COUNTY.—HUNTER CREEK.—*Index:* County Auditor Miner received this week fifteen mineral location notices, representing claims of mineral bearing rock deposited in the district of Hunter Creek. There is much excitement over the new discoveries tbat have been made on Hunter creek.

The ledge is twenty feet wide, and is said to he a lead deposit rich in carbonates. Samples already tried have proved nearly 100 ounces of the white metal, and gold and copper abound to some extent, the former being quite profusely distrihuted along the vein which can be traced over the surface of the earth for nearly four miles.

BRITISH COLUMBIA.

HALL MINES.—Two trial shipments of argeutiferous copper ore from the Hall mines, have heen made. One, of first-grade ore, assayed at Swansea 146 oz. silver and 12¾ per cent copper to the ton of 2,240 lb., and tho other, of secoud-grade ore, assayed at Denver, Colorado, 93.03 oz. silver, 0.13 gold, and 10.98 per cent copper per ton of 2,000 lb. The development work at the mine is being vigorously pushed forward.

IDAHO.

A FALSE BEDROCK.—*World:* The *Statesman* says "the Boise County Mining Company was organized for the purpose of exploring the ground under what is believed to be a false bedrock. The formation is very similar to that in some other camps whore fahulously rich ground was found at great depth." All the above would he correct if the word "believed" were stricken out. This *is* a false hedrock. That fact has never been questioned. Along the creeks for three miles or more, below and ahove Idaho City, and for a distance up the hills on each side, varying from half a mile to a mile or more, this false hedrock has formed over the original bedrock, which is granite. It is plain that this false hedrock was formed by the action of wator, and the general helief is that a lake once covered it.

CŒUR D'ALENE OUTPUTS.—The mines of the Cœur d'Alenes are putting out about 200 tons of concentrates daily, and giving direct employment to nearly 1000 men. The detailed figures are as follows:

Mines.	Output.	Men Employed.
Gem	40	155
Standard	10	45
Helena and Frisco	30	120
Mammoth	5	20
Poorman	45	200
Tiger	25	80
H. H. & S.	50	350
Totals	205	970

The foregoing figures only cover the miners employed. Indirectly the mines give employment to some 500 others—timhermen, employes of the boarding houses, office forces, etc.

Tbis is ahout half the capacity of the developed mines of these camps. If all the mines were running there would he employment for ahout 3000 men. Of course, that in turn would give indirect employment to others.

The mines that are not working are the Hunter, Morning, Black Bear, Custer, Sierra Nevada, Last Chance and Stemwinder.

THE MAMMOTH.—Idaho *World:* Eight or ten men are at work sinking an incline in the Mammoth mine, on Summit Flat. The saw mill is cutting timbers, and it is helieved that work will continue without cessation hereafter. The mine although rich, and large, has lain idle for a good many years. J. J. Taylor, formerly of Ketchum, is the superintendent.

De Lamar *Nugget:* Some of the most heautiful specimens of silver were taken out of the De Lamar mines this week ever seen either

in Idaho or elsewhere. They consist of masses of pure silver in the form of leaves and moss. The leaves and sprigs are so delicate and fragile that the bunches will scarcely bear handling. They are as white and bright as burnished silver. There were several pounds of these beautiful specimens in the crevice.

Coeur d'Alene *Miner:* The first serious accident that has occurred in the Poorman mine for a long time took place there Tuesday morning about two o'clock. Patrick Hanley and Tom Lewis were working together and at the moment of the accident were engaged in barring down the ground which had been loosened by blasting, when a large piece of galena weighing over a ton, fell without warning on Hanley's back, killing him instantly.

There are now about 120 men working at the Gem mine and about forty at the Standard."

MONTANA

A LITTLE ENCOURAGEMENT. *Inter-Mountain:* The recent slight advance in the price of silver has given a little encouragement to leasers who are operating silver properties, and a farther advance is expected when Congress adjourns. Although none but very high-grade propositions will pay to work at the present market value of the metal, there are a number of leasers who have recently taken hold of mines out of which they hope to make at least wages. Out in Independence mining district, west of Butte, several miners have secured properties, some of which, in the days before silver's debasement, were ranked with the great producers of the world.

THE LEXINGTON. It is possible that the Lexington mine will shortly be closed down entirely for an indefinite period. During the past year only a few leasers have been at work underground, and many of them, it is said, at the present price of silver, have been unable to make wages. Some years ago the shaft of this mine was developed to the 1500-foot level, a crosscut several hundred feet in length was run south, but no ore bodies were found. Later the pumping machinery was removed from the 1200, 1350 and 1500-foot levels and the mine was allowed to fill with water to the 800. Now the pumping machinery at the 800 level will be removed, it is said, and a smaller pump will be placed at the 600, to which level the water will be allowed to rise.

IN MADISON.—Pony and Norris are fast becoming the leading gold camps of the State. Every week several carloads of ore averaging from $100 to $200 per ton are shipped to Butte for treatment. A Denver mining man named Dunham recently bonded the Revenue mill and mine in a large sum, and is now engaged in increasing the capacity of the mill to fifty tons per day.

GENERAL MENTION.—Madison *Monitor:* The average assay of the Old Joe ore, eighty-three tons of which were milled recently at the Pony mill, was $22 per ton in gold. This from such a large body is very encouraging. Development work in the mine is progressing.

Bozeman *Chronicle:* John Mitchell of this city sold the Little Bonanza mine in the Crevasse district to E. D. Edgerton, the Helena banker and president of the Crevasse Mountain Mining and Milling Company. The consideration is $5000.

New Idea: E. C. Wittich and C. J. Barnett report the mines of Sunlight Basin looking well. The General Lee mine has a tunnel in 50 feet and the mine has a large body of ore that runs $35 in silver and 47 per cent copper.

Western News: The Nine Mile Mining Company at Martina is running its twenty-stamp mill and is working a large force of men. The San Martina Mining Company is erecting a five-stamp mill which will be running on or shortly after September 1st. Fifteen men are working at present.

Madisonian: A twelve-inch vein of ore, increasing to eighteen inches, was exposed this week by the lessees of Gilbert's Villard mine. The quartz is crystallized with bromic coloring, but differs considerably from that heretofore exposed. Assays of some show $100 in gold and from 400 to 600 ounces in silver per ton.

The shaft on the Kennett mine is down over 230 feet, and the free gold, showing abundantly in specimens, is in heavier particles—the reverse of the flaky-leaf gold in the Bertha—and the ore vein is reported over four feet in width. The matrix, however, is still a sort of bastard quartzite and is heavily charged with oxide of iron.

The Eagle Hill Company is reported to have taken $2400 of placer gold from two boxes at the diggings above Summit. Nuggets worth $400 were picked up one day last week.

UTAH.

TINTIC DISTRICT.—The work of enlarging the Mammoth mill is being pushed to the greatest possible extent. Preparations will be made for forty more stamps, making it a sixty-stamp mill, but only twenty more stamps will be put in at once. One hundred and fifty tons of concentrates are now being shipped monthly, which is only a small part of the product of the mill.

The Eureka Hill mill will probably be running by the first week in September, and will be the most complete mill in the Territory. Work has been unfortunately delayed on account of the non-arrival of important machinery, but is now going forward with the greatest possible rapidity. The Eureka Hill mine and mill should furnish employment to seventy-five additional men, which will be a great lift to the district. The work of the mill is entirely automatic and it should take care of 125 tons per day. A mammoth reservoir has been constructed on the south side of the mill which has a capacity of 500,000 gallons, and will furnish an abundant supply of water.

THE DALY WEST.—Park *Record:* From all accounts the recent strike in the Daly West is something tremendous. The ore body has been uncovered for more than 120 feet and still the end is not yet. So far all the developments have been confined to stripping the ore and no stoping at all has been done. As the work proceeds the magnitude of the deposit becomes something wonderful, while the quality of the rock is all that could be desired and shows for itself wherever and whenever examined, and is readily estimated at 300 ounces in silver to the ton, with from 40 to 65 per cent lead.

NEW MEXICO.

MOGOLLONS DISTRICT. *Enterprise:* A big strike has been made on Captain Sawyer's mine on the Queen lode. At a depth of 101 feet the vein is eight feet in width, all of which is pay ore. Four feet of the vein runs from two to four ounces in gold, per ton. An adit level is being driven on the vein from the bottom of Mineral creek canyon. This will strike the ore chute, found above, at a depth of 258 feet, giving great stopes over head and making it easy to extract and deliver on the dump for shipment to reduction works.

On the Confidence mine ten men are employed making upraises and blocking out the ore bodies ready for back stoping. The ore bins at the mill are about two-thirds full and will soon be filled to their utmost capacity, which is about 1,600 tons. The mill is rapidly approaching completion. Machinery held back by the strike caused some delay but the mill will probably be started in operation between Sept. 20th and Oct 1st.

The Colonial company continues to produce its regular shipments of gold and silver bricks from the ores of the Maud S. The base ore struck some time since is proving to be of exceedingly richness, and when extracted, is being stored away for reduction, probably by a different process.

The Sheridan mill is running successfully, under the management of Andy Wiley, a practical mill man. The Little Fanny ore is being worked to pay for the first time in its history.

The Deep Down company are at work developing the ore bodies in the mine and putting the mine in shape for the economical extraction of ore. In the meantime and until the ore bodies are opened up the mill will be run on custom ore. The Deadwood and Consolidated mines will probably furnish an abundance of ore to run the mill.

ARIZONA.

Payson District.

Silver Belt: There is considerable stir in mining in Payson district. A number of good claims are being developed and the custom mill is well supplied with ore. Lessees of the "85" mine had just finished milling 25 tons of ore, which yielded $49 per ton. Yarnell, of Phœnix, is putting up a three-stamp mill on Rye to work ore from his mine, the Wolsey, and he is promised 300 tons of ore from the Zulu, owned by Hill & Samuels of Prescott. Wentworth & Pieper are preparing to erect a five-stamp mill on Verde, and are now putting an old ditch in order. The power will be furnished by a turbine wheel.

Coast Industrial Notes.

—A telephone line is building from Grass Valley to Marysville.

—The first central electric light plant in Alaska is being put in at Juneau.

—It is reported that the Sierra Lumber Company has absorbed the Tahoe Flume Company in Nevada.

—It is reported that the Great Northern has bought out the Bellingham Bay Improvement Company, lands and railroad.

—For the year ending August 1st, 140 vessels cleared with lumber from ports on Puget sound and in British Columbia.

—The Gila Bend canal and dam site, valued at $1,500,000, at Phœnix, Arizona, has been bought by the Colorado Canal and Land Company for $900,000.

—During the week the Arabia sailed for New York with 1000 flasks quicksilver, 163 sacks shells, 1170 sacks antimony, 141 tons dross and 43 tons infusorial earth.

—The Contra Costa Water Company will issue new bonds to the amount of $2,000,000 to provide for the retirement of $1,000,000 bonds which will become due July 1, 1895.

—The Oroville Gas, Electric Light and Power Company has organized with a capital stock of $32,000, to buy the Oroville Gas Works. The new company assumes control to-day.

—The Seattle Home Telephone Company has incorporated. Capital, $100,000. Incorporated by John H. McGraw, J. D. Lowman, A. B. Stewart, A. M. Brooks, George Gunds. To operate telegraph and telephone lines.

—Jas. P. Witherow of Pittsburg, Pa., is here with the idea of establishing steel works in British Columbia, Washington or this State, to cost about $2,000,000. He wants a bonus as a preliminary to the work.

—The Northwest Interstate Exposition was formally opened at Tacoma, Wash., last Thursday. Work has begun on the main building for the Southern California International Exposition, which is to be held at Los Angeles from October 15th to January 15th.

—The rate on flour to China and Japan, which was $4 a ton for the last eighteen months, has been raised to $6, there being a combine between the Pacific Mail and the Canadian Pacific. The increase goes into effect on the Belgic's cargo next Thursday.

—The Golden Gate flour mills in this city have been closed by the "big combine," and the establishment that made the cheapest flour in the State is for rent or sale. About one-half the flour mills in the State are now idle by reason of their being in the combination.

—During August, five transpacific steamers brought 21,170,000 grain bags here. The Hongkoug steamers brought 5,525,000 additional. The San Quentin manufactory turns out about 4,000,000 annually; California Jute Mill, 2,000,000; local factory, 500,000; Washington State Prison at Walla Walla, 1,500,000, making a total of 34,695,000 bags. The average annual consumption of the coast is about 35,000,000 bags.

—Talking of the new tariff on opium, reduced from $12 to $6 a pound, Collector Saunders of Washington State says: "While the new tariff reduces the duty on opium one-half, that will not affect smuggling, except to increase it about one-half. The smugglers will have to carry just twice the amount to make as much hereafter as they have been making heretofore, and they will do it, too. The new tariff will not stimulate the importation of coal from British Columbia."

—Recent electrical incorporations are the Eureka Electric Company of this city, incorporated by H. A. Smith, J. H. Lawrence, M. S. Lawrence, A. and E. S. Hough. The Solano Electric Light Company of Benicia. Capital, $10,000. Incorporated by T. McKay, K. Chism, K. McArthur, P. Pry of Benicia and G. Frame of Elmira. The Santa Fe, N. M., Gas and Electric Company. Capital, $100,000. Incorporated by S. F. Day, P. B. Coffin and E. L. Bartlett of Santa Fe and C. H. Coffin and J. M. Howells of Chicago.

—A Washington dispatch of last Thursday says advices have been received at the Navy Department concerning the preliminary trial trip of the Oregon, which indicates that she will earn her builders a good premium. On four trips she made continuous runs of six hours each, and the engines were not stopped. It is expected the vessel will make sixteen knots an hour. The contract requires a speed of fifteen knots. The report says she steers like a little boat, and that the final trials will develop not only good speed, but a very easily managed ship.

—The Los Angeles Consolidated Electric Railroad Company has a bonded indebtedness of $3,000,000 and must pay interest on these bonds, amounting to $90,000, by the 16th of this month. Of this amount the Pacific Rolling Mills holds $700,000; the Pacific and People's Home Banks, $600,000; the Bank of California, $150,000; the San Francisco Savings Union, $250,000; J. D. Fry, $50,000; W. H. Piper, $50,000; R. R. Thompson of Oakland, $50,000; the National Bank of California of Los Angeles, $75,000; the Illinois Trust and Savings Company of Chicago, $150,000; Peabody & Co. of Chicago, $150,000, and the remainder in small amounts. It is thought the Los Angeles company will default on the September interest. They request that they "shall be released and discharged from the payment of interest on its bonds of the issue of March 16, 1892, for the period of one and one-half years from the 16th day of March, 1894, and that the interest on said bonds shall be thereafter reduced to a rate of five per cent per annum."

FOR SALE.

Two Mines of Free Milling Gold Ore.

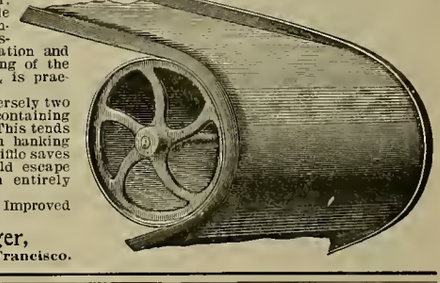
For particulars address JAMES A. SCOTT, Reno, Nevada.

The Blasdel Concentrating Belt Co.

OWING to improved machinery we are now able to sell our NEW IMPROVED CONCENTRATING BELTS for the "Triumph" or Frue Vanners at reduced prices; also our Improved Belts six feet in width.

Practical mill men must see at a glance the advantage of our belts over any other.

First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.



Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

We manufacture smooth belts with our Improved Flanges to order. Send for references.

H. G. BLASDEL, JR., Manager,

419 California Street, - - - - San Francisco.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the two times.

624 Pages. 350 Illustrations.

Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and it possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer.*

Practical Information.

An Hour's Stroll.

Have you ever thought of the distance you travel while you are out on an hour's stroll? Possihly you walk three miles within the hour, hut that does uot hy any means represent the distance you travel. The earth turns on its axis every twenty-four hours. For the sake of round figures we will call the earth's circumference 24,000 miles, and so you must have traveled, during your hour's stroll, 100 miles in the axial turn of the earth.

But that is not all. The earth makes a journey around the sun every year, and a long but rapid trip it is. The distance of our planet from the sun we will put at 92,000,000 miles. This is the radius of the earth's orhit—half the diameter of the circle, as we call it. The whole diameter is therefore 184,000,000 miles, and the circumferenee heing the diameter multiplied hy 31416, is ahout 578,000,000.

This amazing distance the earth travels iu its yearly journey, aud dividing it hy 365 we find the daily speed about 1,586,000. Then, to get the distance you rode around the sun duriug your hour's walk, divide again hy 24, and the result is ahout 66,000 miles. But this is uot the end of your hour's trip. The sun, with its entire hrood of planets, is moving in space at the rate of 160,000,000 miles in a year. That is at the rate of a little more than 438,000 miles a day, or 18,250 miles an hour.

So, adding your three miles of leg travel to the hour's axial movement of the earth, this to the earth's orhital journey aud that agaiu to the earth's excursion with the suu, and you find you have traveled, in the hour, 85,253 miles.

To Dam the Nile.

From time immemorial the Nile has, like other large rivers, discharged an enormous flood at one season and yielded a less lavish amount at another. So low are its shores, much of the way, that great inundations result from high water. Partly to reclaim some of this land, and partly to secure a more ample supply in times of drought, it has heen proposed to coustruct a dam iu some eligihle place, aud thus to store the excess in the season of overahundance. Engineers have heeu over the ground within a few months, and have just made their preliminary report. The hest site yet found for the purpose is at Assuan, 1300 miles from the Mediterranean. It is situated at the end of a series of cataracts. Here a good foundation ou igneous rock could he laid. Ahout 5,500,000 acres of land would he made availahle for agriculture and other pursuits by this enterprise. But as the country ahove Assuan is very high, the dam would back water for 125 miles up stream, to Korosko, and suhmerge the sites of several interesting old temples. It has not yet heen decided whether or not to go ahead.

Hoarding of Gold.

A writer in the *Pall Mall Gazette*, of London, calls atteution to the enormous accumulation of gold in that financial center, the total amount of gold now in the Bank of England heing nearly $200,000,000, a sum unprecedented in the history of that institution. Referring to this fact, this writer states that, as after 1867 and 1866, the Bank of Englaud "is ouce more watching for the time when the mighty torrent of gold will again burst the dam and cause a general and rapid improvement in the value of securities." People, says he, must have something for their money, and the question soon must he, who is going to set the example for going in for the purchase of second, third and fourth-rate investments? "In times gone by the same process has always heeu gone through, and it must inevitahly he gone through again. At the present time there are some thousand millious sterliug of money, or $5,000,000,000, lying on deposit with the London banks, and hardly any of the depositors dare to move their portion iuto securities that are not gilt-edged."

THE average export price of wheat from the United States for the past cereal year was 67.2 cents per hushel, compared with 79.9 for the preceding year, and an aunual average of 90 cents for a period of ten years euding with 1893. The average price of flour exported for the year was $4.11 per barrel, compared with $4.54 the precediug year, and an annual average of $4.81 for ten years euding with 1893.

The Fauvel Process.

W. E. Meade of Cheyenue is ahout to introduce the Fauvel process into the Silver Crowu district, Wyomiug, where the Oronogo Miniug Compauy owns a numher of veins varyiug in width from six to twenty-four feet, all low grade, showing au average value of $6 per ton. The Fauvel furnace will cost ahout $50,000, hut it is expected to treat ore at an average cost of $1 per ton, without the use of either chemicals or electricity.

P. G. Sanford of the Royal Mint, Loudon, gives a description of the Fauvel process, saying:

"Heat, air and water are used to oxidize the refractory elements and liherate the gold. By the time the ore has reached the bottom of the tower it is completely sweetened and is ready for further treatmeut. This generally consists in wet amalgamation; and as water must play an importaut part in that process, the idea suggested itself that the cumhersome system of trucks and coaling floors might be advantageously replaced a running stream of cold water. Acting on this, Fauvel made hy a number of experiments on the effects of quenching the incandescent ore in a hath of cold water. The results surpassed all expectations. Each glowing particle, as it falls into the water, causes an instantaneous generation of steam, accompanied hy a report of a miniature explosiou. At the same moment, auy glaze or film which may have formed on the particles is ruptured, aud they are hroken down to a remarkably fiue state and rendered very hrittle. So much is this the case that an arsenical pyrites which had heen crushed ouly to pass a thirty-mesh sieve was, after roasting and queuching, reudered an impalpahle powder. The importance of this innovatiou cau hardly he exaggerated. In the first place, exceedingly fine crushiug is not necessary, and therefore the output of the mill can be very much increased. In the second place, the ore is reduced to such a microscopic size as to make the retention of gold articles impossihle. Thirdly, the film of oxide, which is so apt to coat the grains, is removed, and the gold is reudered clean aud shining and in condition specially adapted to amalgamation."

Mining in Shasta County.

To the Editor:—Mining matters seemed at a low ebb here four or five weeks ago, but at the present time the marks of prosperity are seen everywhere. Placer mining by the dredge system in the Sacramento river near Middle creek promises to pay larger dividends on the investment than anything in the county. The Deestlehorst dredge is a home-made affair, cost about two thousand dollars and was built by men wholly inexperienced after various changes and alterations and numerous breaks. The dredge commenced to find the pay channels. They have a large bucket holding about one ton, and work in the coarse gravel and boulders. Finding no pay in the sand or fine gravel, the gravel is dredged from a depth of from ten to twenty-five feet, dumped on a grizzly with a shaker attachment, which drops the boulders back into the river and lets the fine material down into a line of sluices. About a cord and a half of wood furnishes steam for the twenty-four hours, and six men do the work. The average clean-up has been $150 a day for the last two months, with ground enough on the various bars to last them fifty years. There is room enough for a dozen dredges to operate indefinitely on the bars The Chinamen who flumed Clear creek near Igo have in 500 feet of flume and work twenty men. They are in new ground and average $200 a day. White men would have nothing to do with it, but John gets there. Iron mountain is laying in a stock of wood and preparing for a fall run. They will probably mill six or eight thousand tons of ore. The Balla Callela windy camp group are working a force of men cleaning out tunnels, building a wagon road to connect with the Uncle Sam wagon road, and are also grading a mill-site and putting in a flume to furnish power from Squaw creek. The Minnesota mine starts up running ten stamps next week, their tunnel now being in 970 feet on the ledge, and cutting three ore chutes. They have 400 backs and will probably make a good record. Quartz Hill, presided over by Count Maryanskai, has been running their ten stamps at the Calumet plant over a month. The results of the first week's run were nothing; the next week they assorted the ore and made expenses. Since this they have learned a lesson, leaving out barren rock, and the results have been satisfactory. They have ordered ten more stamps and a locomotive for their three miles of railroad. A steam drill is being used at the mine, and the mine worked as an open cut. Jack Conant has just unloaded a ten-stamp mill, which goes to the old Wheeler mine, near the Gladstone mine, in French Gulch.

The Gladstone managed to pay off its labor accounts this week, and now has only $15,000 of attachments to settle. It is understood that negotiations are complete for meeting these when they will resume operations. Prof. Morton has a bonanza in the old Myers mine, near the Tom Green, in French Gulch.

Machinery for the quicksilver mines in Trinity comes rolling in in carloads daily. The road is strung with teams. The gold quartz finds near Trinity Center are phenomenal. Ore working $300 to $400 per ton is found in quantity and excitement runs high in the Old Diggings. The Walker mine struck a large ore body a few weeks ago at a depth of 400 feet from the surface, and its superintendent estimates 170,000 tons of twenty-five-dollar gold quartz in sight. Hart's Bullyehoop mine is about to try wet chlorination again. Hart's Texas & Georgia at Old Diggings is running twenty stamps as usual. Dr. Garlick, who has the Bully Hill mines under bond at Copper City, has got the old 800-foot tunnel open and uncovered the copper ledge. It is sixteen years since this tunnel was opened before. A large body of low-grade copper ore is already exposed.

One More Process.

A Philadelphia firm, said to have plenty of capital, has control of a process of treating low-grade ores, and the "Nascent Extraction Metal Co." has been organized.

"In practice," says the inventor of the process, "results are obtained by grinding the ore to about forty mesh and mixing with about one-half its bulk of coke ground to ten mesh, or even larger, and placing the mix in a tank having a false or dropping bottom made of carbon plating and covering the ore with brine. Upon the passage of an electrical current chlorine is eliminated within the ore, owing to its porosity and conductivity, and the gold is immediately dissolved and transferred by the current by a slowly revolving metallic cylinder on which the gold is deposited and wiped off continuously. After the ore has been exhausted the false bottom is dropped, allowing the mix to fall upon a sieve of such a size as to allow the spent ore to be washed through, while leaving behind the larger sized particles of coke or other carbon to be reused.

"It is calculated that with ease as much as twenty tons of ore can be worked at one time, and the time will be from one to five hours, according to the amount of metal in the ore and the strength of current needed. One electrical horse power will deposit over one pound of gold per hour. In our method we lose nothing; everything is recovered except the horsepower and small mechanical loss of the materials used. The amount of water often is a consideration in treating ores. In our method little is required, after obtaining a suitable supply at the outset. Roasting of the ore is not needful, since any gold combination whatever can be undone by electrolysis."

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 30, 1894.

The swing of the pendulum is sending silver up, and though there is a great deal of difference between $1.29 and 66 cents, yet even the fifteen cents advance during the mouth has encouraged thousands all over the coast in the hope that the advance will continue.

Lead does not seem to share in the advance. There is a good deal to he said regarding the constant and (to the consumer) the unsatisfactory difference between the New York lead quotations, as wired, and its actual price.

Considerable has been published concerning the manipulation of lead quotations by the smelting combine, or the "lead trust." The Salt Lake *Tribune* declares that the producers of lead ore in that region have been bled by the Lead Trust from $2.50 to $7 per ton on all the lead contained in the ores which have been converted into bullion hy the smelters.

To appreciate the magnitude of the "sweating" the Western producers have been subjected to hy the Lead Trust, it furnishes the following figures which show the prices at which sales are made of deliveries of lead in warehouses licensed hy the New York Metal Exchange, at net cash prices, and in quantities of not less than twenty-five tons:

On April 19th last the selling price paid for lead in New York was $3.45 per 100 pounds. From April 20th to 26th, inclusive, $3.42½ was the selling figure. On the 27th it dropped 2½ cents, and on April 30th the hasis of settlement for deliveries was $3.37½. To May 2d, inclusive, the quotation was the same. From May 3d to the 11th $3.35 was the actual price paid. On May 16th $3.35 was the settling basis, and the correct quotation on the 14th, 15th, 17th and 18th was $3.32½. On May 21st the price dropped 2½ cents, hut rallied again the next day. The next three days $3.30 was the ruling price, but from May 28th to June 4th, inclusive, $3.27½ was the real quotation. On June 5th, 8th and 11th $3.25 ruled, while on the 6th lead was up 2½ cents, and on the 7th it was off 2½ cents from the three days named. Excepting on June 14th, when the base metal rallied to $3.32½, the settling price paid for lead deliveries in New York from June 12th to 19th, inclusive, was $3.30 per 100 pounds.

The Official Daily Market Report of the New York Metal Exchange, dated June 19, 1894, furnishes corroborative evidence of the manipulations complained of. The Report gives the settling prices for June, July, August and August deliveries of lead at $3.30 per 100 pounds; for September and October deliveries, $3.27½, and for Novemher, $3.25.

The New York quotation hy telegraph governs the price paid for ores by the smelters on the day assays are made. During the entire period from April 19th to June 19th the actual prices paid for lead in New York ranged from $3.45 down to $3.22½ and up to $3.30, hut all the while the quotation on the metal was sent out hy telegraph from New York at $3.10 per 100 pounds. On this latter hasis the lead-ore producers were paid for their product by the local and Eastern smelters, while in reality the ruling price was 20 to 35 cents per 100 pounds higher.

The manipulation of the quotations sent from New York hy wire is done by two hrokers, selected for the purpose, fixing the price of lead at $3.10 or $3.15 per 100 pounds, and the New York Metal Exchange agrees on these figures as the price smelters are to pay for the hase metal contained in lead ores. The assertion is hased on information hy the secretary of the Exchange.

A report on the production of lead in the United States during the first six months of '94, suhmitted to the United States Geological Survey by Special Agent C. Kierchoff, shows a heavy falling off in the quantity of the lead drawn from domestic sources.

The production of desilverized lead amounted to 86,772 net tons against 95,921 for the first six months of 1893; and of soft lead 15,610 tons net against 16,305 for the corresponding period last year. The total production of refined lead was 102,382 net tons against 111,926 in the first half of 1893, the refined in bond amounting to 21,392 net tons against 12,230 for the first half of last year.

The lead available for home markets aggregated 80,990 tons, including 9736 tons representing the contents of Mexican and Canadian ores.

From these sources the lead production netted 71,204 tons against 83,830 net tons during the first half and 80,506 tons in the second half of 1893. The stock of lead in refiners' hands amounted to 2655 tons on July 1, 1894, as compared with 2468 tons on Jauuary 1st. The stock of soft lead was 2060 tons in the heginning of the year against 1880 on July 1, 1894.

Treasury officials estimate that 60,000,000 pounds of lead will he imported this year from Mexico in silver ores. The old tariff was 75 per cent of its value; the new is 37½ per cent.

Quicksilver is quoted at £6 5s in London.

New York Prices.

NEW YORK, Aug. 23.—Following are the closing prices for the week:

	—Silver in— London.	N. Y.	Copper.	Lead.	Tin.

Mining Share Market.

SAN FRANCISCO, August 23, 1894.

The expected advance has not yet materialized, and despite daily favorable reports dullness pervades the street. Con. Cal. & Va., Union and Sierra Nevada had some life during the week; the majority of the stocks were in the dumps. Even the advance in silver conveys no huoyancy. Last Monday the Con. Cal. & Va. sold silver to a city hank at 66⅜, the highest since last Febrnary. The steamer China last Tuesday for Japan and China took over half a million in silver, including 283,478 Mexican dollars.

It is expected some of the Carson river mills will resume operations next week.

The following illustrates the changes of the week:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 21, 1894.

524,776.—EXPLOSIVE COMPOUND—G. J. Buechert, S. F.

524,777.—NIPPLE HOLDER—Jos. Canney, Butte, Mont.

524,539.—PAVING ROLLER—W. E. Dennison, S. F.

524,821.—FILTER—H. Eisuer, S. F.

524,779.—SAWMILL CARRIAGE OFFSET—C. Elridge, Oakland, Cal.

524,801.—GAS BURNER—H. Eischweiler, S. F.

524,894.—STRIKING BAG — C. A. Forsberg, New Whotcom, Wash.

524,901.—BOILER—E. C. Jordon, Sacramento, Cal.

524,721.—HYDRAULIC VALVE—T. H. Lee, Seattle, Wash.

524,947.—RAILWAY SIGNAL — A. B. Murray, San Rafael, Cal.

524,862.—HAY DERRICK—D. Ogilvie, Elko, Nev.

524 769.—DOOR OPENER—G. Rischmuller, S. F.

524,810.—DOOR OPENER—G. Rischmuller, S. F.

524,916.—CAN LABELING MACHINE — Tardif & Wethered, S. F.

524,923.—UMBRELLA LOCK—N. B. Whitfield, Portland, Or.

23,574.—DESIGN—W. H. Ward, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NIPPLE HOLDER.—Joseph Canney of Butte, Montana. No. 524,777. Dated August 21, 1894. By the use of this holder what is known as the "leader screw" or "draw thread," and the set screws of the ordinary die stock, are dispensed with. This is by reason of substituting other means for directing and forcing the die on the nipple. These means are a holding nut seated on the end of the rod which passes through the stock, the nut having a shoulder equal in diameter to the exterior diameter of the nipple against which it hears. The shoulder is exteriorly threaded, whereby the dye when seated ou it is guided and forced directly upon the nipple. The holder is also adapted for the cutting of different sized nipples. This is effected hy suitable bushings and hy different holding nuts having shoulders of different diameters.

AUTOMATIC OFFSET MECHANISM FOR SAW MILL CARRIAGES.—Charles Elvidge of Oakland, Cal., assiguor of one-half to John D. Eby, of same place. No. 524,779. Dated August 21, 1894. The device consists of a cam or segment mounted on the carrier and having rollers within it which are freely rotatahle in one direction hut locked in the other, and power connections from the cam or segment to effect the offset and return of the carriage at the heginning of the jigging and feeding movements respectively. The objects obtained hy this invention are simplicity and durahility in construction, accuracy and effectiveness in operation, and particularly the advantage that, not being dependent upon the carriage axles, its action cau be relied upon to take place at proper times.

FRUIT CARRIER.—No. 524,568. Aug. 14, 1894. Edward E. Wade, San Francisco, Cal. The object of this invention is to provide a protective recepticle and carrier for fruit and other perishable articles to he used in conjunction with the exterior boxes or cases. It consists of independent compartments made of flexihle material coiled into cylindrical form at one end so that each will enclose an article of fruit, and these cylinders have projecting flaps or leaves extending heyond their junction with the compartments, so that the projecting flaps of any two will extend iu opposite directions and form a third compartment between each two adjacent ones. This compartment material is corrugated to render it elastic and to keep the fruit from heing bruised, and each series within the outer case is separated hy horizontal partitions having ventilatiug openings made through them.

ANHYDROUS AMMONIA PURIFIER.—No. 524,567. Aug. 14, 1894. Richard G. Sneath, San Fraucisco, Cal. This invention relates to an apparatus which is adapted to purify anhydrous ammonia under pressure. In the use of anhydrous ammonia, as illustrated iu ice-making and refrigerating machines, the ammonia hecomes gradually reduced in its effective action hy hecoming contamiuated with light gases or with water or heavier liquid which, in spite of all precautions, will hecome mixed and greatly interfere with the operation of the machines and reduce their capacity. This iuvention is designed to draw off hoth the gases and the water hy a simple connection with the pipes through which the liquid ammonia must travel. It consists of a vertically disposed chamber introduced hetweeu the lines of pipe which convey the ammonia and which join the chamher on different horizontal planes. The upper end of the chamher extends above the level of the inlet portion of the pipe, providing a space in the upper part for the gases which separate from the ammonia, while the heavier impurities and water will settle to the hottom and may he drawn off through a cock at the hottom of the chamber, while the ammonia itself thus purified passes out through an intermediate pipe or hranch. These various pipes, inlets and outlets are provided with suitable controlling cocks so that any one of them may be opened or closed at will.

LAMP HEATER ATTACHMENT.—A. H. Cowen, San Fraucisco, Cal. No. 524,667. Dated Aug. 14, 1894. The ohject of this inventiou is to provide an attachmeut for the ordinary illuminating lamp wherehy the heat from the lamp chimney is received and radiated so as to warm the air of the room. It consists of coucentric rings with a series of horizontally connecting wires formed with the bends holding and clasping the rings with proper relation to each other; the outer euds of the wires being hent upwardly, form holders for the lower eud of the heating drum, while the iuner ends terminate iu vertically extending downwardly opening hooks, which fit over the upper end of the lamp chimney and rest upon its upper edge whereby the heating drum is supported directly from the lamp.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

MINING

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING.

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Gond, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

OFFICE: MCPHEE BUILDING, DENVER, COLORADO.

California and Nevada Agency and Experimeutal Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

Gold Quartz Mine For Sale.

A Good Quartz Mine, near Scott Bar, Siskiyou county, is offered for sale. Parties wishing to invest in quartz-mining property will do well to examine this ledge, from the extension of which tendollar rock is now being crushed. The average width of the ledge is two feet. For further information, call on or address W. A. CHAMBERLAIN, Yreka, California.

Union Gas Engine Co.
Pioneer Manufacturers
Of Gasoline Engines and Owners of Twenty Patents on Same.

ENGINES FOR MINING PURPOSES A SPECIALTY.

WARNING!
If you are in need of power for mining purposes investigate this engine and take no other. Many so-called gasoline engines are now on the market, which are direct infringements of our patents and it is our intention to bring suit against the various infringers. As the law holds the purchaser, as well as the manufacturer, we would advise parties who have already purchased other gasoline engines to obtain from the sellers of such engines a good and sufficient bond protecting themselves in case damages are obtained against them, as it is not the policy of this company to work a hardship on innocent parties, but the law makes no such provision.

For any information, pamphlets, circulars or testimonials, call on or address

Jas. S. Brownell,

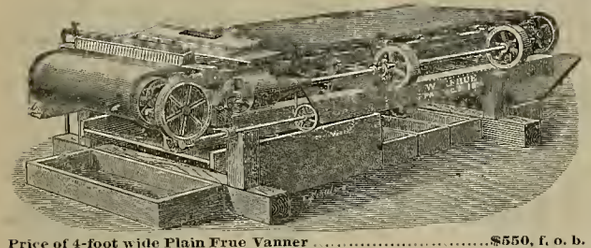
(Successor to ADAMS & CARTER,)

AGENT FOR THE

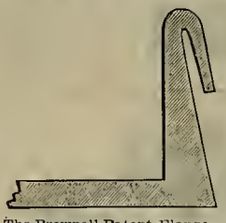
FRUE ORE CONCENTRATOR,

132 MARKET ST.,

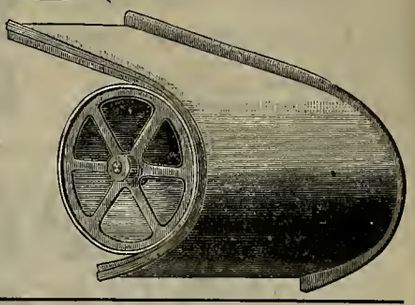
San Francisco, Cal.



Price of 4-foot wide Plain Frue Vanner.....$550, f. o. b.
" " " Improved Belt Frue Vanner..... 700, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 700, f. o. b.

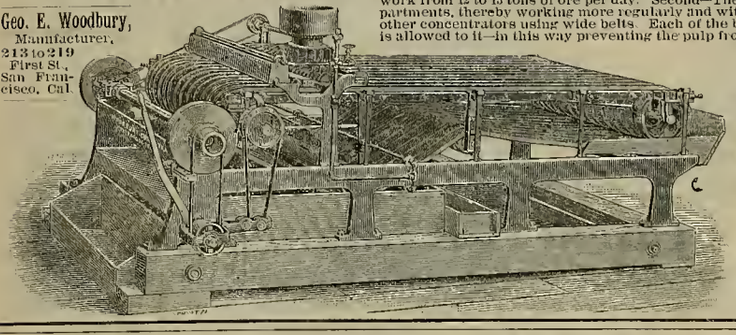


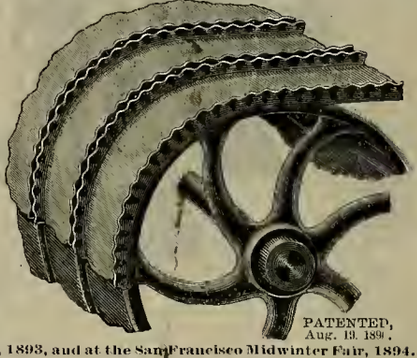
The Brownell Patent Flange.



THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 213 to 219 First St., San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1894.

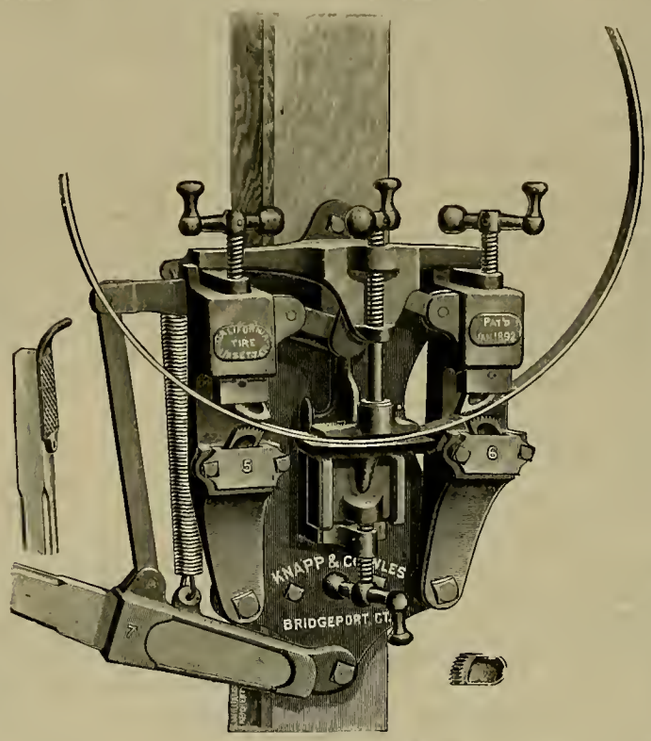
First Stamp Mills.

Inquiry being made for data regarding the first stamp mills erected in this State, it appears from "The First Quartz Mill in California; Sketch of Nevada County, 1856," by A. A. Sargent, that "The first quartz mill was built in January, 1851, on Wolf creek nearly opposite the present Empire mill, by two Germans for Mr. I. Wright. The mill (a water mill) was a small affair and not successful, but it was the *second* one built in the State, the first mill being built in 1850 in Mariposa county, which also proved a failure."

The "Directory of Grass Valley Township for 1865," by William S. Byrne, says: "The French mill is situated on the west side of Wolf creek, Grass Valley. It was built in January, 1851, by a couple of Germans for I. Wright. This mill, the second one constructed in the State—the first being built in 1850 in Mariposa county—was a common affair, run by water power, having *eight round* stamps each in a *single* mortar."

The "eight round stamps" are believed to be the first revolving stamps. The first successful quartz mill in California was built in the winter of '50–'51 by Sowers, Abby & Ridgell. It was a steam mill. A few months later Judge Walsh built a mill there, which he sold to Crossett & Collins. About the same time Conway & Preston built the New Helvetia mill, Col. Richardson built one and the Mount George Company put up a third.

In the summer of '51, Commodore Stockton built a quartz mill at Grass Valley, and another at Mariposa, the crushing being done on the principle of a pestle and mortar, the cam being so arranged as to partially revolve them, a separate mortar being provided for each "stamp" or pestle.



CALIFORNIA TIRE UPSETTER.

California Tire Upsetter.

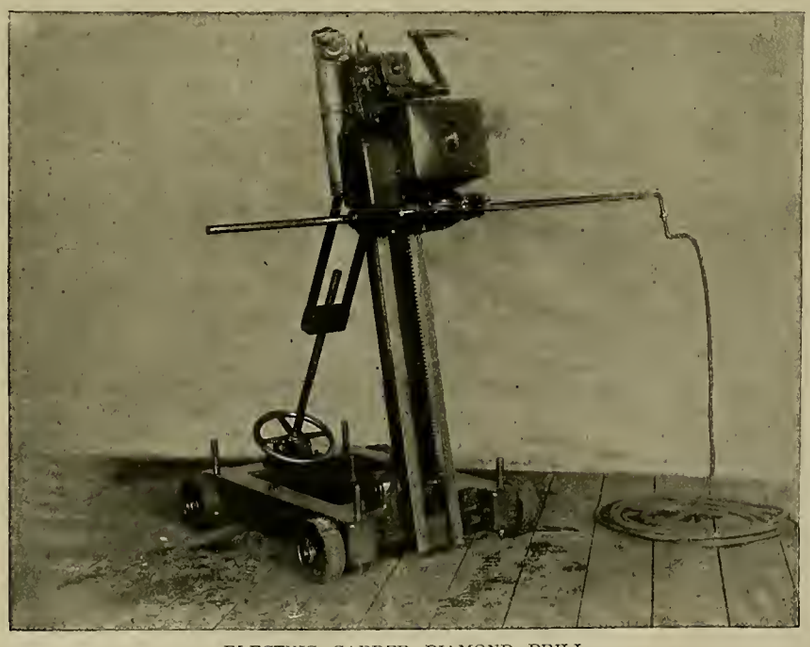
On this page is illustrated the California tire upsetter, made by Knapp & Cowles, Bridgeport, Conn. With this machine tires can be shortened without cutting and without a hammer. It works with perfect ease equally well on light and heavy tires. When not in use the handle can be removed.

In operating, the lower center plate is adjusted to conform to circle of tire. The tire is placed in position, the center plate screwed down, then the jaws, so as to grip firmly on both sides. If properly adjusted, there can be no slipping when force is applied to the handle, which is done by the left foot, leaving the hands free to use as required. In this way you can get two or three compressions in one heat. Bar iron can be upset by adjusting the center plate in line with the work.

To set for use, it is necessary that the post has a true face. By boring a hole for the top bolt three feet eight inches from the floor and with the two bolts below secured firmly, but not too rigid, it is ready for work.

Electric Gadder Diamond Drill.

An adaptation of quarrying by electricity is the electric gadder diamond drill recently put out by the General Electric Company This machine is of two K. W. capacity. The table on which the actuating mechanism rests can be inclined at any angle with the floor, and allowed a travel of seven feet parallel to its face. In addition, the drill can be so lowered as to drill within two inches of the rock bed, and by a change in the driving and nut gears, the automatic feed may be adjusted to the nature of the rock. The motor is provided with a reversing switch, which, with a proper arrangement of gears, makes it possible to cut into a corner in either direction, by reversing the feed screw in the feed device—that is, the gadder can cut either to its right or left side. It is provided with a quick return mechanism. While cutting into the rock, the drill is fed slowly—in marble the speed is about one foot per minute. When it has reached the desired depth it can be given a quick back feed by the simple movement of a lever. The motor is of the iron clad, waterproof and dust tight type. The end thrust of the feed screw in both directions is taken up by the ball thrust bearings. The drill rod can be made of any reasonable length up to twelve feet.



ELECTRIC GADDER DIAMOND DRILL.

E. E. Nesbitt, of Adelaide, has a new method of treating slimes which he considers effective. It is a reversal of the ordinary mode of using blankets in the treatment of heavy concentrates from mineral ores. Instead of passing the tailings over a table covered with a blanket, short lengths of blanket are suspended over the floor of the race or table in such a way that the water, as it flows over the surface, passes beneath the suspended blankets, which trail on the surface of the flowing water. This process of treatment is only applicable to mines where there is a large percentage of float gold, which is ordinarily carried away in the tailings.

A Denver dispatch says San Francisco is paying $1 an ounce more for gold than Colorado points—an unlikely story in fact, though there is gold and gold; some gold is worth a dollar an ounce more than would be paid for other kinds.

The Anchor Mining Co. of Park City, Utah, is defendant in a $25,000 suit by the wife of James Linden, who asks damages in that amount for her husband's death, the company being alleged to have been negligent.

The "overproduction and want of consumption" statements, so common, do not apply to gold. In this regard it would be interesting for some of our agricultural friends who decry mining to reflect for a moment on what the probable present condition of this State would be had gold never been discovered in this State.

San Francisco, September 8, 1894.

TABLE OF CONTENTS.

ILLUSTRATIONS.—California Tire Upsetter; Electric Gadder Diamond Drill, 145. Methods of Mine Timbering, 148-149.
EDITORIALS.—First Stamp Mills; Electric Gadder Diamond Drill; California Tire Upsetter; Miscellaneous, 145. Miscellaneous, 146.
SCIENTIFIC PROGRESS.—Electrolysis of Buried Pipes; Sympathetic Vibration; Miscellaneous, 152.
MECHANICAL PROGRESS.—Flight by Steam Power; Electrical Muscle Making; Miscellaneous, 153.
ELECTRICAL PROGRESS.—Electrical Voltage; Miscellaneous, 156.
PRACTICAL INFORMATION.—Our Little World; A Novel Bridge Test; Photographic Plates that Won't Frill; Miscellaneous, 157.
MISCELLANEOUS.—Concentrates, 147. Methods of Mine Timbering, 148-149. Black Magnetic Sand; River and Harbor Improvement; Buying Gold Dust; Personal; Obituary, 150. The Mineral Hydrocarbons; In South Africa; Complimentary Notices, 151. Decline in Use of Brimstone, 152. Ancient Gold Miners, 153. Faster Transportation, 156. Coast Industrial Notes, 155. Notices of Recent Patents, 158.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 154-5.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, etc., 158.

THE *Herald* suggests that a Miners' Club be organized in Nevada City for mutual benefit and to supply the wants of visiting capitalists, etc. Such an institution could be made of present and permaneut value in illustrating the resources of the county, as well as being a social organization.

THE Award Committee of the California Midwinter Exposition announce that the bronze medals of award can now be had upon application; that solid coin gold medals can be procured by payiug $80 each, and solid silver medals at $9.50 each, which, under the circumstances, appears to be reasonably dear.

THE general statement iu most papers published in mining towns that "'tis useless to come here lookiug for work: the camp is full of unemployed men," is not found in the Telluride, Col., *Republican*, which declares that miuers are needed there and that the demand is greater than the supply.

SEC. GRESHAM and the British Minister resident at Washington have agreed to have a commission meet at Vancouver, B. C., to decide upon the amount the United States Government must pay in damages for the twenty Canadiau sealers seized more than a league off shore in Alaskan waters. A conservative estimate places the amount at $600,000.

T. A. EDISON is reported to have spent nearly $2,000,000 at Ogden, N. J., in his magnetic process of refining iron ore. He proposes to dispense with smelting, and, by a cheaper process, separate the iron from the non-metallic accompaniment by means of magnets. He has done so mauy wonderful things that his financial backers feel fully justified for the faith that is in them.

SILVER holds its advance, and the object lesson given the couutry in the universal dullness aids in the realization that that metal must be remonetized before permanent financial improvement cau take place. Fine-spuu theories of fine-haired professors must give way to public demands, and bimetallists are strengthened by the steady change of thought throughout the world.

FROM the Broken Hill Proprietary Co., Limited, of New South Wales, is received a report of the mine's workiugs for the six months ending May 31st, '94, which illustrates the immensity of its workings. Though the white metal is so depreciated iu price, this big mine paid a uet profit of £397,378 7s 1d for that six months. It cost £2 12s 6d per ton to treat the ore, of which 257,278 net tons were extracted in the one-half year, producing 7,287,337 ouuces of silver, 25,638 tons of lead and 441 tons of copper. This is an average output per week of 280,282 ounces of silver, 986 tons of lead and 17 tons of copper, au average of 30 ounces of silver to the ton of ore. There were 3352 employes. There was a profit of £1 9s 6d ou each ton of ore treated, the uet amount received during the six months from sales being £1,104,216 11s 5d. A foot note on one of the pages says: "The strike disarrauged costs and profits for this one-half year."

THE month of August was a dreadful one for accidents in mines. Despite all that precautiou, intelligence and safety devices can do, the anuual death list caused by miniug casualties is a dreary one, and the finaucial loss mounts into the millions. On the earth's surface one can ordinarily take care of himself; undergrouud he is at the mercy of his fellow-workers, and carclessness or incompetency wreak fearful results. A great proportion of last month's accidents were, as usual, occasioned by explosions iu coal miues.

WITH wine at ten cents a gallon, delivered in San Francisco, wheat at fifty cents a bushel, and wool at four ceuts a pound, our agricultural brethren of the State must think the gold miner has a little the best of the situation, that commodity being in constant demand at top figures. Fortunate, indeed, is the commonwealth in these dull times that can produce the gold whose possession eases the financial pressure, and short-sighted are those of its citizeus who strive to hamper the great mining industry that is the present life of the State, as it was the original source of its beiug.

SOUTHERN CALIFORNIA papers believe that that part of the State "is on the eve of a petroleum boom." There ueed be nothing "boomy" about the development of petroleum in this State, for it is as legitimate and conducive to profit as auy other form of mining. The oil wealth of the State should be developed, and doubtless will be. Considerable has been done in Los Angeles county; considerable more can be done in Ventura. State Mineralogist Crawford recently sent a competent represeutative to make a thorough examination of the oil belt in that section of the State, which extends northwest and southeast through the counties of Santa Barbara, Ventura and Los Angeles. His report will be shortly forthcoming.

THE annual report of Commissioner of Patents Seymour shows that during the past fiscal year there were 35,952 applications for pateuts, 1050 for designs, 108 for reissue, 2193 caveats, 1720 applicatious for trade-marks and 368 for labels. There were 21,496 pateuts granted, including reissues and designs; 1656 trade-marks registered and 2 prints registered. The number of allowed applications which were by operation of law forfeited for non-payment of the final fees was 4566. The total expenditures were $128,561. The total receipts over expenditures not placed to the credit of the patent office in the treasury amouuts to $4,409,367. The receipts show a falling off of $105,286 from the previous year, and expenditures decreased $57,481.

SPEAKING of the Golden Age, the *Mining Journal* says: "The past, when viewed through long vistas of years, becomes bright with the glamor of time—time that leuds dignity to an uusightly mound and luxuriance to a duug-hill. Historians, by the aid of imaginatiou, which they in common with poets, company promoters aud artists skilled in the mysteries of prospectus writing use extensively, have pictured for us successive golden ages in the annals of the world, but the present is iuvariably far removed from the gilded periods portrayed. After all, we suspect it is only gilt that glistens through the avenues of time. There never was a golden age in the actual past in either a moral, material or miueral sense. From a mineral point of view the present age is comparatively more golden thau any which has preceded it. To-day it is either gold or nothing. Silver pales with shame at the price to which it has fallen; copper loses its ruddy hue when it remembers it used to be four times its present value; lead is heavy and depressed with its owu weight, and with the fact that to miners it is an unprofitable commodity; even tin shines with dimiuished luster wheu it recalls the old prices paid per ton for its silvery-looking ingots; and iron, influenced by the inactivity of its markets, joins in the metallic gloom, and wears a look of chronic rustiness. In short, 'gold is on the boom.' This is the age of gold, and every legitimate effort to increase the world's store of the bright yellow metal should be encouraged. Commerce craves for more gold; men of all uations and creeds hunger aud thirst for it. Leather circles have ceased to be counters for value; cowrie shells are obsolete as currency except in beuighted lands; copper is no louger legal teuder; and GOLD, GOLD, more GOLD, is the universal cry. We live in the Golden Age."

EDITORIALS on "the approach of the 20th century," plentifully appearing, suggest that our chronology is a scanty one, the merest fragment of a mighty record, and a thought of curiosity as to what the total would now be iu figures had it been possible for man to keep a correct tally of the years. Several times the attempt has been made, starting from some notable epoch, but after running up to 3600 or 4700, came some cataclysm that broke off the count and theu the chronicle began all over again. The Chinese have a connected chronology of several thousand years, alongside of which our little 1894 looks small, but even theirs is but fragmentary. Probably after our A. D. has reached 2600 or so, will come some era deemed worthier to date from, and the people who are waiting to be born iu that far-ahead time will start the count anew, beginning with the year 1 again, as has been done so many times before since first humanized apes found it convenient to note the recurrence of the earth's annual journey around the sun.

THE Salt Lake *Tribune* thinks the mining men of Utah should begin to make arrangements for the new Constitution. The gold and silver miners especially ought to see that nothing inimical to their interests finds its way into that Constitution. In most countries a reward is paid to a man when he finds a precious metal mine. That at least used to be the rule. The rule in our couutry is that if a man finds a mine and reaps a little more from it than the expenses of ruuning it, he has to be a wonderfully good man to avoid the criticism which seems to be on the lips of a great many people, that down deep he is a robber. There must be no clause in that new instrumeut to cripple iu any wise the legitimate pursuit of mining, because it is from that that Utah must expect her future prosperity. That is, the product of the mines that must supply her people with that lubricating fluid of commerce which is called money. The first Constitution of the State of Nevada was defeated solely because there was one clause in it which the miners of that State thought was inimical to their interests.

SELDOM has a prophet honor in his own or any other country, so it is with pardonable pride Ernest Seyd recalls the fact that just twenty-three years ago, at the time when the demonetization of silver was first proposed in Germany, he predicted, should such action cusue, "a fall of gold prices, and a consequent depression iu all trades aud industries throughout the world." In the light of recent events, still more remarkable is the reading in '94 of his prophecy in '71 that "the strong doctrinism existing in England as regards the gold valuation is so blind that wheu the time of depression sets in there will be this special feature — the economical authorities of this country will refuse to listen to the cause here foreshadowed. Every possible attempt will be made to prove that the decline of commerce is due to all sorts of causes and irreconcilable matters. The workman and his strikes will be the first convenient target." All the British and some of the American journals are to-day attributing the universal financial staguation to "the workman and his strikes," when as a matter of fact they but confound cause and effect. The strikes, like the fall iu prices, are but results. The papers that say "the workman and his strikes" are the cause of the depression used to claim that there would or could be no reduction of wages. Now that there has been a tendency to reduction they must fall back on some other explanation. Meanwhile Seyd's prophecy is fulfilled. It looks uow as if the next big strike would be on the part of capital.

Concentrates.

THE Comstock August payrolls amounted to $89,469.17.

THREE DOLLARS per shift is the ruling wages in the Mercur mine, Utah.

THE Alaska-Treadwell G. M. Co. paid $450,000 in dividends last year.

THE Summit Mining Company is about to build a mill near Sutter Creek, Cal.

AT Silver Star, Nevada, the Douglas Company's mill has started up again.

THE work of sinking for greater depth at the Virtue mine, Oregon, has begun.

THE Grass Valley Miners' Union is now reported to have nearly 500 members.

THE Morning Star mine of Iowa Hill declared a dividend of $2 per share last Wednesday.

THE Moser and Linderaxa mines, at Mokelumne Hill, are enjoying an era of prosperity.

THE Oak Tree mine hoisting works at Maybert, recently destroyed by fire, will be rebuilt.

THE borax plant, thirty miles south of Kennedy, is shipping the refined product to the railroad.

A $40,000 FIRE at Angels Camp last Monday burned one-half a block in the business part of town.

IT IS expected that the new Pilot Boy smelter in the Kootenai country will begin operations this month.

ON the Snake river near Adkins, Oregon, Chinese have discovered placer mines which pay from $5 to $8 per day to the man.

ARTICLES OF INCORPORATION of the Oak Tree Quartz Mining Company have been filed in Nevada Co. Capital stock, $100,000.

THIRTY-EIGHT MEN are employed at the Phoenix mine, Sierra City. The ten-stamp mill will soon be changed for one double that capacity.

COLORADO exchanges think that this year's output of gold and silver in that State will be $27,000,000—$15,000,000 gold and $12,000,000 silver.

THE cleanup at the Mercur, Utah, mill for the first half of August was over $18,000. The proposed 200-ton mill will be built the first months of '95.

THE Chaparral Hill mine, near Angels, Cal., is reported bought by an English, Boston, New York and Chicago syndicate, who will build a 100-stamp mill.

ALASKA is to have another 200-stamp mill, it being the intention to put one on the Ready Bullion and Golden Chariot claims near the Mexican mill on Douglas Island.

THE Grass Valley miners have passed resolutions requiring Assembly candidates to pledge support to a bill to abolish compulsory trading at the stores of mining companies.

A STATEMENT by the director of the Mint shows that the coinage during the month of August was: Gold, $7,722,000; silver, $976,000, of which $748,000 was standard dollars.

THE Salt Lake Copper Manufacturing Company have produced about 150 tons of copper matte, which is still waiting to be put through the reverberatory and casting furnaces.

THE New York Hill Gold Mining Company has applied to the court for permission to dissolve as a corporation. The money remaining on hand will be divided among the stockholders.

THREE years ago W. S. Stratton of Cripple Creek, Col., was working for $2.50 a day. He is worth $3,000,000 in coin and expects to get more out of his mine which he discovered himself.

THE Amador *Dispatch* hears that work will be resumed on the Gover mine, near Drytown. Suits now pending will be suspended until the company can get squarely on its feet again.

THE Soap Root, Wild West and Lone Star mines, at West Point, have made great strikes recently and that town is enjoying a mining boom which makes its people think of old times.

H. S. BLOOD of Bear valley, in Alpine county, has sold the valley to T. Bishop of this city, who will use it for a reservoir to collect water to be used in mining near Vallecito in Calaveras county.

THE total gross output from the Mendota, Col., group of mines for the first seven months of this year foots up $30,258.45. As compared with the same period for 1893, this is a falling off of over 200 per cent.

WORK has been begun by the Montreal Company on their property across the river from Robinson's Ferry, Calaveras county. Forty men are now employed, and the number will shortly be increased.

THE Marguerite Gold Mining and Milling Company has been incorporated in this city by George Schmitt, George Schafer, Henry Keifrich, F. M. Freund and Charles Peach, with a capital stock of $500,000.

TEN claims, close to the Ibex, Detroit district, Utah, have been sold to St. Paul men for $45,000 cash. The vein is said to be "sixty feet in width at the surface." The Ibex was recently sold for $135,000.

JOHN AND D. H. COLIS recently organized the New York Company in New York, with a million dollars capital. The company has bought eight mines in Tuolumne, the last purchased being the Seminole, for which was paid $125,000.

CHAS. HARVEY, now in this city, was recently sent from England to report on the Palmetto mines in southern Esmeralda, Nevada. He has sent his report, which, if favorable, will result in active operations beginning in January, '95.

A BOISE, Idaho, dispatch says a very rich gold ledge has been discovered on Willow creek, fifteen miles from there, two and one-half feet of ore being stripped for 300 feet, its value being variously estimated from $1000 to $2000 per ton.

THE coal-miners' strike at Belt, Mont., has ended by the companies closing down all the mines, stores and boarding houses, and stopping work on the new coking plants and railroads. The officers say that the shutdown may be permanent.

ON August 31st the Mercur (Utah) Mining Company declared its bi-monthly dividend of $25,000—12½ cents per share. That is the sixth dividend, and the company says it has prospects that assure the declaration of many times six more dividends.

THE Nevada *Herald* says the gravel borer which was put in the Derbec mine a few days ago is working finely, and the results are better than the owners expected. The mine is looking well and a good force of men is employed, both day and night.

EVEN floods are not without their blessings. S. N. Hinman is now taking from $2 to $4 daily from a flat owned by him just below the Kettle Falls of the Columbia. The high water threw up enormous bars, which are said to be exceedingly rich in gold.

THE Rawhide mine, Tuolumne county, is not for sale for $1,750,000. The owners have too good a property to sell for that figure. The present monthly yield is reported to be $75,000. Chlorination works are building, with a capacity of four tons a day.

MESSRS. MILLS, WATTS AND MENDENHALL, representing a syndicate of Chicago capitalists, have located a gravel mine near Comanche. They have a new washer, which they propose to work on this claim, and which they assert can handle and wash 1000 cubic yards of dirt per day.

NOTICE has been received at the Denver branch mint that the new toughening plant has been shipped to Denver and will be ready for use by the middle of next month. This addition to the mint plant is intended to give the final hardening to the refined gold, preparing it for coining.

THOMAS EVERSOLE, Archie Dowell, Hugh Guy and Charles Proctor, miners, were killed in the Amethyst mine at Creede, Col., last Saturday by a fire, which burned the shaft house and caused the skip to fall upon them. The loss by fire is $20,000. The mine is now filling with water.

THE Nevada *Transcript* says: Two mules have been lowered to the 1600 level of the Maryland mine, and will be used to haul cars. They will take the place of carmen, and it is said will materially reduce the running expenses of the mine. A stable 14x16 feet has been built underground for the mules.

THE Alaska Mexican Gold Mining Company reports its cleanup for July as follows: Period since last return, thirty-one days; bullion shipped, $15,651; ore milled, 6256 tons; sulphurets treated, 100 tons; of bullion there came from sulphurets $3181. The working expenses for the month were $12,472.

THE Herrold mine, on the Mokelumne river, Calaveras county, has been bought by S. Bell of Oakland. Ten men are employed putting the mine and mill in order for permanent work. It had been closed down for several months. The former owners were caught and went under when the Pacific Bank closed.

THE Columbia Mining Company has been organized at Seattle, Wash. It has purchased 640 acres of land opposite Yale, B. C., and has begun hydraulic operations there. It paid $28,000 for the property. Water will be carried across the Fraser river on a wire suspension bridge at a cost of $50,000.

COMPLAINTS are made, says the Cripple Creek *Miner*, that the smelters only pay $19 an ounce for gold. When the treatment charges are cut down, the price for gold is also cut. On high-grade gold ores (five ounces and over) $19.50 is paid, but the smelting charge is greater than on the lower grades where $19 is paid for the gold.

THE Colorado Mining Company of Sonora will get in the former Cerro Blanco railroad between their mines and Torres station, a distance of fifteen miles. The Cerro Blanco mines are a failure, and never produced a pound of ore, although over a quarter of a million of dollars were put into expensive machinery, railroads, etc.

THE Cœur d'Alene has shown the advantages of concentration; the Homestake the way to reduce sulphurets by chlorination; Cripple Creek by concentration and smelting; the Mercur by cyanide; Denver by utilizing sulphur for fuel; the Witwatersrand by plates, concentration and cyanide, and so on down the list, while Nevada clings to pan amalgamation.

KING & WILTSIE, owners of the Mother Lode gold mine at Murray, Idaho, ask an injunction against the Treasure Box Company from further interfering with the working of the Mother Lode mine, which was shut down by the turning off of the water by the Treasure Box owners. The Mother Lode is said to be paying between $500 and $800 per day when in operation.

THE Seth Cook group of gold mines at Coulterville, Mariposa Co., have been sold to Boston and Montana men, who own forty-four mining properties near Butte, Mont. The price was $100,000. It is intended to expend over half a million for requisite machinery, including a 200-stamp mill, which will be built on the Merced river, an electric road running from the mill to the mines.

REPORTS from Chile say that in Coquimbo the gold fever continues unabated. Andacallo is not the only place where gold has been struck. It is also reported found at Cruz de Canas, in a virgin state, and also in the province of Ancud, where sixteen men recently obtained $8000 worth in as many days. The gold is said to be very fine. A rush has set in from all parts in consequence.

CONSIDERABLE activity is reported at Perris, Cal. The Santa Rosa mine has been sold recently for $400,000. It is working a ten-stamp mill and taking out $20,000 to $25,000 a month in gold. There are two new mills being put up, and these will be followed by others. At the present time there are in the neighborhood of 300 men employed in prospecting, working in the mines or employed about the mills.

CALAVERAS COUNTY doesn't propose to be behind in announcing novelties, and furnishes in the Starlight mine, between Old Gulch and El Dorado, a wonderful tale of discovery. Near the bottom of a 125-foot shaft has been struck a seam of porphyry which supplies a strong stream of water "highly colored, being nearly as yellow as gold and plainly holds considerable of that precious metal in solution. It is ice cold and very palatable. Several of the men at work on the mine were formerly in the habit of getting full of whisky at every opportunity, but since drinking freely of this water they have no desire for liquor of any kind and are truly as completely cured of the liquor habit as though they had taken a course of treatment at the gold cure." This is plainly a case of gold cure.

FARMERS in Lincoln county, Washington, are annoyed by too much gold, the placer miners on the banks of the Columbia washing out the yellow metal in the shade of the apple trees. In locating their homesteads the agriculturists must swear that no part of the "legal subdivisions" is valuable for mining purposes, which, under the circumstances, is a little difficult to do and tell the truth. The matter will probably be referred to the Secretary of the Interior.

IN December, '93, E. A. Stent, W. B. McDougall and J. L. Whitney of Tuolumne Co. took a bond on the Mammoth mine, one of the Morton lode properties, near Jacksonville, twelve miles southwest of Sonora. They did some development work, showing its value. Last Wednesday they sold the mine to the English owners of the Sierra Buttes and Plumas-Eureka mines for $80,000. The new owners expect to build a fifty-stamp mill and employ eighty men.

IN the North Fork mine, Sierra county, work has been resumed, and it is expected this famous old mine will duplicate its bullion record. The present owners have 1200 acres on the old Bald Mountain channel, besides extensive timber lands and valuable water rights. It it thought that a tunnel 2800 feet in length will bring them to pay dirt. The channel they are running for is known to be very rich, the old Bald Mountain Company having taken out hundreds of thousands of dollars.

NEARLY fifty per cent value of the 2500 tons ore crushed at the Morgan mill from the Comstock in August was gold. Wherever the vein narrows there is an increase in the percentage of gold yield, iron pyrites making their appearance. It is now thought that the large areas of low-grade ore in the Comstock can be treated so that ore yielding only $8 a ton can be worked at a profit. Such a deposit as that in the Chollar mine should be of value. The Crown Point is illustrating what can thus be done.

THE *Star* of Johannesburg, South African republic, gives the results of operations in the Witwatersrand gold district for June: From mills, 108,007⅔ ozs.; from concentrates, 7032½ ozs.; from tailings, 48,800 ozs.; alluvial sluicing, 127 ozs.; other sources, 4195⅛ ozs. The values were respectively £390,340, £26,728, £140,361, £460 and £14,682, making an aggregate of £578,371, or about $2,800,000. The mills with an aggregate of 2250 stamps crushed 228,888 tons, the number of tons per stamp per day being 3.76, and the average yield per ton being a little over $8. Of tailings, 220,507 tons were treated with an average of $3.

THE Vanderhilt, Cal., *Shaft* has suspended and the editor departed for Utah. He left the following notice pinned on the office door: "The *Shaft* is sunk. Development work has closed, for no success has attended our efforts to find the pay streak. To our enemies we say: If you can get any comfort out of the failure of one whose efforts are and have been entirely for the good of the camp, just take it and may you be happy. To our friends we say: Good luck to you, and please accept our thanks for what you have done for us. To all, our friends and our enemies, those we owe and those who owe us, we say—Adios."

THE Prescott, Arizona, *Courier* says the old theory that Arizona gold mines "don't go down" is now thoroughly exploded. The trouble has been that a system of pocket mining has prevailed and the pocket miners did not go down after the ledges which happened to jump off a few feet. Of late years a few men have started an era of deep mining in that vicinity, and in no single instance has there been a failure in a gold mine proving as rich or richer than on the surface as depth was reached; and it has also been demonstrated that the surest way to get a mine is to take up one of these worked-out surface gold pockets and sink for the ledge. Some of the richest discoveries made in the last few years have been made in just this way.

THERE is no getting at the output of bullion in that section of Arizona around Prescott, as the utmost secrecy is maintained regarding its production and transportation. As an illustration of this, the following incident serves: A short time ago, as a reporter was making his daily round of the town, he happened to walk some distance behind a seedy-looking man who carried a half-grown satchel which accidentally became unclasped and flew open, revealing to his astonished gaze a large gold brick worth several thousand dollars. The man was taken by surprise and stated that the gold came from a mill and mine a few miles from Prescott, but begged that nothing he said about it, as he had already been shot at on a previous trip.

PRIMITIVE methods of gold mining are reported from Sinaloa, Mexico, where the natives work only in dry weather, sinking rude shafts from eight to sixteen feet to bedrock, and panning the gold in the crudest method, though making from $2 to $5 per day. The merchants there who buy the gold, which is mostly coarse gold, are reported to place the precious metal in one side of a pair of scales, while the other side is filled with grains of corn until balanced. A calculation is then made which is very much against the poor Indian—one grain of corn equals one grain of gold. In this way the merchant gets the gold at less than $7 per ounce, and payment is made therefore in Mexican silver, which is there quoted at thirty cents per ounce.

JULIAN SONNTAG, general manager of the Giant Powder Company, Consolidated, tells the *Journal of Commerce* that the powder business has been remarkably good, and this is a surprise owing to the unfortunate condition of affairs that exists in silver-mining districts, where the amount of work done has been very materially decreased; but this has been offset by the numerous gold mines that have been discovered and are being profitably operated. The revival of railroad building has helped trade, and more is being done in that direction than any time during upward of two years past. This will probably require a vast amount of giant powder for an indefinite future time. Prices are low, owing to heavy competition, and they will probably hold their own.

ONE thing which throws a doubt in the minds of conservative miners as to the value of new camps is the flush announcement that Smith has struck it big on Gizzard gulch, and that Brown has already taken up a townsite at the mouth, and is laying off lots. Now Smith's discovery, if of value, is alone valuable for the mineral it contains, and he has to show up something more tangible than surface cropping or pan washings to prove its permanence and value as a stable enterprise. Other valuable claims will have to be proven satisfactorily as coming producers. When this is done the camp is solid and the townsite matter will have been happily regulated. A simultaneous announcement of a rich strike and a townsite location is generally a fake so far as both are concerned.

Methods of Mine Timbering.

NUMBER III.

When the ground has a tendency to thrust itself up in the bottom of the shaft, the plan of planking and bracing the ground is sometimes resorted to. (The same principle is applied in drifting, when the method is referred to as "carrying breast boards.") In this method lagging is driven down in advance of the sinking, being supported in position above by a frame of timbers, either permanent or temporary. Planks are laid on the bottom of the shaft, being secured by upright posts, which abut against strong stulls or cross-pieces firmly wedged above. When the pressure from below begins to exert itself, a board near the center is removed and the soft, pulpy mass allowed to force itself upward. The material is removed until the ground is eased somewhat, when a second board is removed, the first being replaced somewhat lower than before, and again secured; the material coming up through this new space is removed as in the first instance, and in this manner work proceeds entirely across the excavation. The process is slow and requires considerable timber, but it is a plan which may prove successful when all others fail.

The method of driving lagging in shafts is similar to that explained under the head of drifts.

In some instances iron caissons have been sunk outside or inside the timbers to enable miners to pass through very loose, watery ground and quicksand. Where this is not absolutely necessary, wet places have been passed through by making a clay lining between two layers of close planking. It may be from two inches to one foot in thickness, according to requirements. It has been successfully employed in passing through quicksand and watery, loose ground.

In very bad wet ground the idea is to form a caisson-like structure with lagging, the interior being sustained, as explained above, by massive timbers, so placed as to resist the pressure of the surrounding rock mass. The exigencies of each particular case must determine the course to be pursued.

The expedient of freezing soft, wet, running ground, quicksand, etc., is now much resorted to with great success. It is a patented process, but finds general use where applicable.

Circular shafts are seldom sunk in America now, though very common in the early days in California. There are circular shafts all through the old river-bed region, which pass down through the tufa capping without a single stick of timber from top to bottom. Many of them are over 250 feet in depth, and, notwithstanding they were made more than forty years ago, are still in good condition and likely to remain so for a century. The rectangular shaft is the most common form in this country. "L" shafts do not find much favor and have nothing to recommend them. The size and number of compartments of a shaft must be determined by the amount of hoisting expected to be done through it.

Guides in shafts where cages are used, or where skips run on guides, should be so joined that there is no likelihood of warping or projecting, and jam the cage or skip, which is a most dangerous thing and a great strain on the cable. The overlapping of the ends has been for years a common practice, the two ends being secured at the ovelap by a single lag bolt. An improvement has been made on this plan, with a view to greater safety, by joining the adjacent ends of sections with a simple tongue and groove, like ordinary flooring or wainscoting. The ends each have a lag bolt, which makes them doubly secure. The drawings show both styles for framing guides. Spikes or nails should never be used, as it requires much more time to remove a section when repairs are necessary. Guides are most easily repaired by laying a secure platform in the compartment at the point requiring repairs, the men working upward from set to set. Should the whole shaft, or any large portion of it, require new guides at any time, the platform should be put in as described. The hood is removed from the cage and a bottom of loose boards laid on the floor. The workmen at the platform unscrew the lag bolts and take out the old, worn guides. The cage being lowered to the proper point, the old guides are passed up through a hole made in the bottom of the cage and the new guides passed down in the same manner and put in place. In this way the guides may be removed for a thousand feet in a single day by a gang of good workmen. Other repairs in the shaft may be made in a somewhat similar manner.

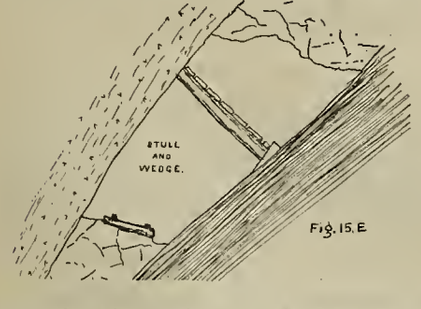

Fig. 15.E.

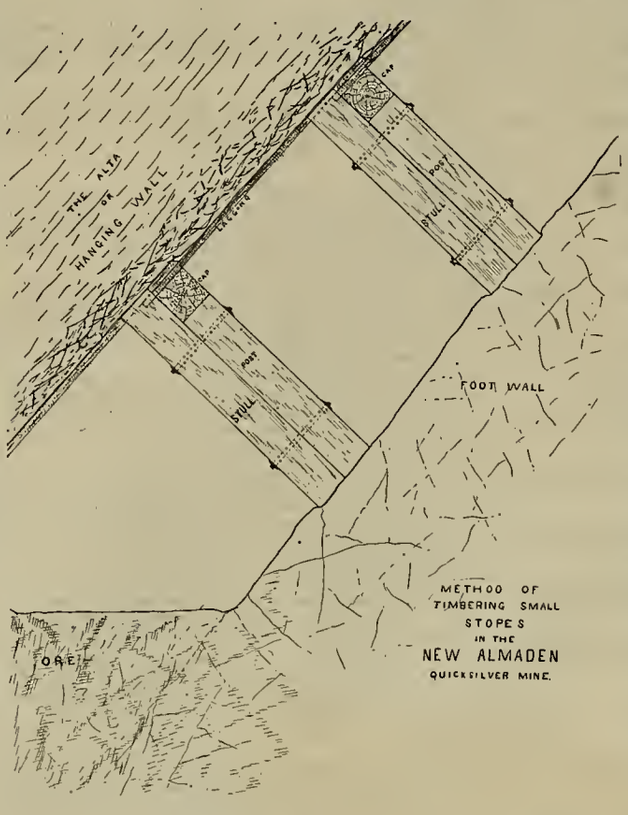
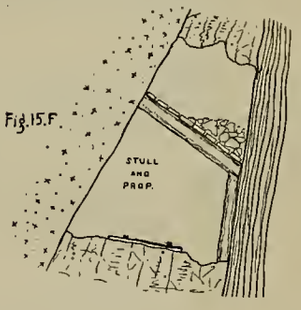
Inclined shafts are somewhat different from those that are vertical, and are probably quite as numerous. In California the number of inclined shafts far exceeds those that are vertical, being, as a rule, sunk on the vein which, in a majority of cases, dips at some angle from the horizontal. In a general way, what has been said of vertical shafts applies to those that are inclined. There is considerable difference, however, in the manner of framing timbers for an incline, and while timbers framed for an incline will do, perhaps, equally well in a vertical shaft, those framed as already shown in the illustration are not preferred in an incline.

The cuttings in mines which require the most care and greatest skill in placing timbers to support overhanging ground are "stopes" and large "chambers." The method adopted must always depend upon the size of the excavation, character of the ore and of the walls, the pitch of the vein or ore shoot, and also on the expense of the timber.



In some portions of the New Almaden mine, where the width of ore stoped is about ten feet, an unusual method of timbering has been adopted. The foot wall is usually hard and solid, while the "alta," as the hanging wall is called, is almost always soft and shelly, and is considered dangerous ground. Heavy stulls are placed at regular distances (about eight feet,) and are set in line one above another Immediately above the stull a second shorter timber is laid which rests upon the foot wall and reaches within about a foot of the hanging wall. A plate or cap is inserted over the upper end of this auxiliary stull which reaches horizontally across to the next stulls which are similarly placed. Heavy lagging is driven upward along the hanging wall, the lower ends of which rest upon the cap and the upper ends upon the lower ends of the lagging of the next set above. The two stulls are bolted together near the top and bottom for additional strength and security. Redwood has been used quite extensively in timbering this mine, and it is claimed that it has given satisfaction. The accompanying sketch will show this method of timbering. The large stopes of the New Almaden are timbered in square sets.

In veins which lie quite flat, the thickness of the vein and the system of mining must determine the character of timbering to a great extent, as well as the character of the walls. Where the vein is thin (a foot or two) very little timber is required, the waste rock filling the entire space behind the miner. Where the mineral deposit is thicker and timber is necessary various methods are pursued. Some ground stands well by simply leaving pillars of mineral. In other cases a series of upright posts and breasting caps will sustain the roof, the posts being placed in rows directly back of the workmen and as close to the face as the necessity demands. The foot of the post rests either directly on the rock floor or upon a block of wood or piece of heavy plank. The posts



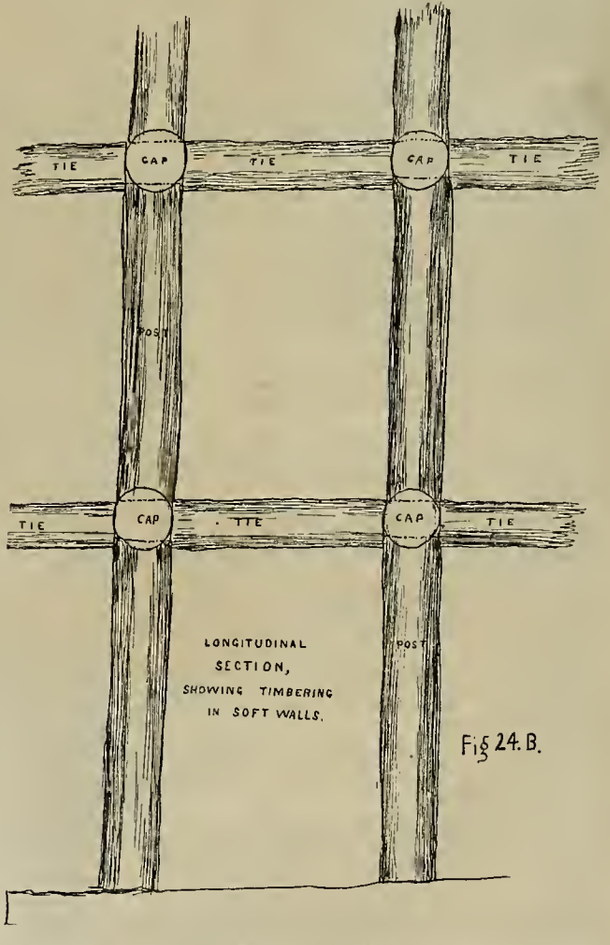


Fig. 24.B.

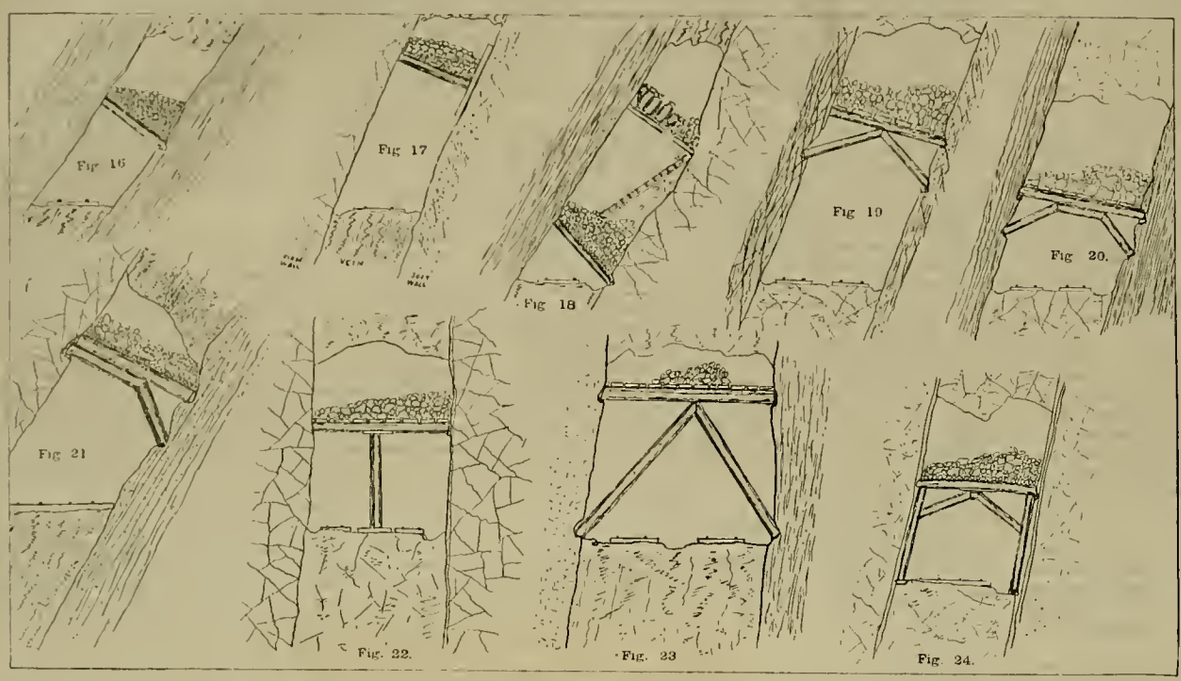
are forced into position by driving them up with heavy hammers. Care must be taken that these posts are so placed as to receive the weight of the roof directly and not at an angle. These timbers are set in lines standing in two, three or four rows back from the face, the waste being piled behind as the work advances. In this manner, by exercising care, many sticks can be recovered before the weight settles so heavily on the refuse rock as to render it impossible to remove the timbers. Some flat veins make little or no waste. It is then necessary to follow the "pillar and stall" system of extraction, considerable blocks being left to sustain the roof. Posts and caps are used in this system also. Frequently the caps reach in a continuous line from post to post, joining the next set, the ends of two caps resting on a single post, the combined sets being a hundred feet or more in width. Large timbers thus placed will support great weight, but if small rocks fall from the roof, lagging must be employed. This system is much in use in California gravel drift mines.



When a vein lying nearly or quite horizontal and making no waste is to be mined, a drift should be run along the lowest portion of the deposit, this point having been reached by incline or shaft. The work advances toward the surface, good sized pillars being left to sustain the roof. If timber is necessary, it is put in place in the manner required. The work having advanced sufficiently far toward the surface, the pillars may now be cut out at the back end, while the work progresses as before. As the pillars are removed more timber must be put in, or waste from the surface must be piled in cribs of timber built in the workings already made. Usually some timber can be recovered in this way and the caving of the roof after the complete removal of the ore or mineral does no harm. The main gangways should be substantially timbered, if necessary, as it is desirable to keep it open to the lowest working level at all times.

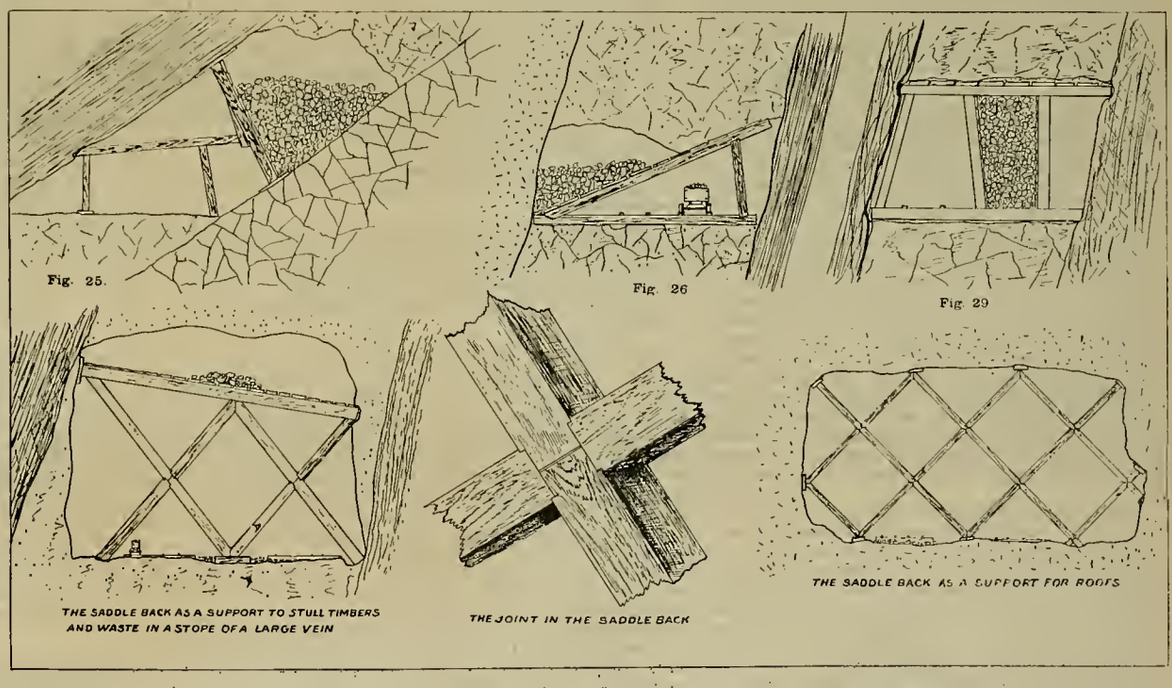


Fig. 25.
Fig. 26
Fig. 29
THE SADDLE BACK AS A SUPPORT TO STULL TIMBERS AND WASTE IN A STOPE OF A LARGE VEIN
THE JOINT IN THE SADDLE BACK
THE SADDLE BACK AS A SUPPORT FOR ROOFS

The "long wall" system of extracting ore is usually carried from the surface inward, a main gangway having been first driven ahead to a connection with a ventilation shaft, when possible. All the ore is removed at once, the waste being thrown back of the miners, who carry the breast forward with center considerably in advance of the sides, the excavation being in form somewhat like the letter "A," with the apex forward. The waste is thrown into the center to support the roof, while the side passages permit a free circulation of air all along the face.

In vertical or steeply inclined veins, the principles governing the methods of timbering are essentially the same as those above explained, though the application is different. In such workings the post of the flat vein becomes a "stull."

When a working drift is driven along a vein in ore and it is the intention to "stope" out the ore, the character of the walls and the width of the vein or deposit must determine the method of timbering. If the walls be hard and firm, and the vein not more than ten or twelve feet wide, posts are not absolutely necessary. Stulls of the proper length are placed with the lower end resting on the footwall, or in a niche cut for the purpose, the upper end being placed against the hanging wall and driven downward until it stands at a few degrees above a right angle with that wall. (See Figs. 16 and 18.) When the footwall has a greater inclination than the hanging wall, a support resting on the floor of the drift must be placed under the lower end of the stull. Should the footwall have a less inclination than the hanging wall, the foot of the stull may be secured by driving in stout wedges from the upper side. Where the footwall is sufficiently hard and firm, a niche in either case will answer as a secure rest for the lower end of the stull. Where the vein is more than ten feet in width and additional support appears necessary, resort may be had to the plans shown in Figs. 19 to 29.

In case either wall, or both of them, is too soft to safely sustain stulls under the pressure of ore or waste to be piled upon them, a plate (usually a two or three-inch plank) is inserted behind the stull on either wall or both, as may be necessary. (Figs. 17 and 25.)

When the walls are very soft, and even with the use of plates rendering timbering insecure, the stulls may be placed at right angles to the walls, the ends resting upon posts. Mining upward, the posts of each floor rest upon the stulls under foot and immediately above the posts on the floor below. In this manner a stope in soft walls may be carried to any desired height. (Fig. 24 A.) In such instances it is necessary to place longitudinal braces or "ties" reaching from cap to cap at right angles to the stull. These ties may be of smaller dimensions than the stull and post timbers.

The method shown in Fig. 19 may be employed where the vein exceeds eight or ten feet, and when sticks sufficiently large to support the weight of ore or waste cannot be obtained. Fig. 20 may be employed in the same manner with a greater width of vein. Both of these instances presume considerable waste to result from mining, which will, to a great extent, fill the excavation. Fig. 23 affords a firm support to a stull in a wide place in the vein, and Fig. 22 the same in a still broader vertical vein. Fig. 25 shows how, in a vein of low dip and considerable width, a stull may be firmly supported to retain waste or ore coming down from the stope above. In soft vein and wall rock a substantial method of placing sill, stull and post is shown in Fig. 26.

Stulls are placed at distances ranging from two and one-half to six feet, as may be required. On them are laid split lagging, forming a floor. As the miner stands on the floor thus improvised, he breaks down the ore, separating it from the waste, if there be any, and sending the ore into the "level" or main passageway below, allowing the waste to accumulate on the floor. The waste often occurs to such an extent that a portion of it also has to be sent to the surface. When this is the case, very little timber is required in the stopes. When, however, the quantity of waste is small, it is often necessary to build a temporary staging upon which to stand until a sufficient space is cut out above to admit of laying a second tier of stulls to sustain the floor. Floors are six to eight feet apart, and sometimes even more.

A passageway, called a "mill hole," "chute" or "slide," is left every thirty to fifty feet for the purpose of sending ore to the level below, as the work progresses upward. The distance between these slides is determined by the dip of the vein. They may be a greater distance apart in a steeply inclined vein than in one having a low angle of inclination. Rock will not run freely on a slope having a slope of less than forty degrees, and more is preferable. In cases where the slope angle is low, it is a good idea to line the slide with plank to facilitate the delivery of the ore to the level beneath. In opening a stope between levels, the best method is to make a raise from level to level, building a loading chute at the bottom. Then at a short distance to one side (fifteen or twenty feet) a second raise is carried up about fifteen feet and connected with the winze. From this point the stope is opened, the excavation being carried upward and the ore being passed down through the winze to the loading chute. As the floors are carried up a crib is built around the winze, keeping it constantly open. This plan secures economy of labor and affords the best obtainable ventilation. The stoping of ore continues to within a few

feet of the level above, aud is then discontinued for the time being, this mass of ore and that remaining within a few feet of the floor beneath being left to be taken out the last thing before abandoning this portion of the mine.

When ore is very rich it is the custom to blast or pick it down upon canvas or boards, keeping it separate as far as possible from the waste, the ore being sacked in the mine. The methods above described apply to overhand stoping, that is, excavating from a level upward.

(To be continued.)

Black Magnetic Sand.

Writing to the *Bulletin* regardiug the gold-bearing sand of the Pacific shore, E. W. Keeler says:

The great difficulty that for years has met every prospector for gold in these black sand deposits that constantly follow the line of tidal upheaval, is the fact that magnetic iron as fine as the grains of gold, and of nearly the same gravity, are found side by side, with a great preponderance of the iron. In some localities there is found in sand 25 to 40 per cent of pure magnetic iron that is capable of making a quality of metal equal to the finest imported Swedish. In all ordinary methods of separation this iron is so fine it is in the way, and interferes with any system of reaching and reclaiming an equally fiue particle of gold.

The coustant moving of the base for gathering these sands is objectionable on the score of successful or profitable working by ordinary methods.

It is supposed that from the extreme limit of the ebb tidal line on the beach, seaward, these sands have rested in greater quantity and depths for the reason that it is mostly after storms or high lashings of the sea that the profitable crests of sand are thrown up, showing that these particles drop and are imbedded near the outer line of disturbance.

In my washiug of sands from the vicinity of Gray's Harbor I found at least 30 per ceut was of fine magnetic ore. A fire assay of this ore showed a value of $26 of gold per ton. A deposit on the Atlantic Coast I worked was equally rich in magnetic iron, but carried no gold.

My method of separation was by electricity, while the sand was passing through my device in a wet state, which made a perfect separation, the magnetic iron not containing after separation three per cent of sand particles, and the effect is immediate, permitting the gold particles remaining to be recovered quickly and safely while the waste material is passing through. The iron has, and, it is thought by some, always will be, the difficulty in the way of securing gold, expeditiously and cheaply removed before attempting to secure the gold. Edison invented a process, by use of permanent magnets and first baking the sands, which did very well, but, being so expensive, is not available. My system removes quickly, just as the saud might be shoveled into the device from the beach, and can be constructed so three or four men can pull over the beach and manipulate all the sand they are able to gather; should the iron be desired for smelting, extra labor to bag and remove might be required. In one batch of sand I experimented with, the sand came from a depth of twenty-five feet, 100 yards away from the beach, and was equally rich in magnetic ore, and probably ages ago the line of the tidal flow was at that point. Ships are loaded with such maguetic iron ores at the mouth of the St. Lawrence river and taken to Europe, where processes for converting have been especially built.

I visited the only one in this country, which has been reconstructed in order to utilize these fine magnetic ores, and some 700 tons of the magnetic ore from the black sands, such as I experimented with, was being used. The muck bar iron was so superior that at that time it secured purchasers at $15 per ton over the ordinary. This furnace is surrounded by some twelve or more large hollow iron cylinders. A cone surmounted and rested on their edge. The ore was raised and dumped in the apex and filled each cylinder with this magnetic ore, which is as fine as granulated sugar. So connected, the ore was sprayed at intervals from the bottom over a furnace fire, with the usual flux used, one-third of the bed of fire being charcoal and a flame of jets from coal oil. This ore is so fine and pure that smelted in the ordinary way it would be quite consumed and irrecoverable for commercial use. With a permanent resting place for a machine and a constant supply of the sand the cost of separating the magnetic iron should not exceed—saying the sand carried even 20 per cent of the iron only—$1.50 to $2 per ton of iron. At the furnace above referred to it was calculated that 2.800 pounds of magnetic fine ore would make one ton of muck bar iron. The cost of this ore at that time at the seaport was about $10 per ton, with an expense of probably $2 more to reach the furnace in the interior. With the openiug of the Nicaragua Canal these ores will find a ready market on the Continent, and the sands carrying gold will always give in working an advantage over any produced in any other quarter of the world, and so give the Pacific States another inexhaustible mine of wealth.

River and Harbor Improvement.

The bill recently passed by Congress, and suffered to become a law without the President's approval, appropriates money in this district as follows:

Improving Sacramento and Feather rivers, California: Continuing improvements, including treatment of the Yuba river, near and above Marysville, and of the Bear river, one hundred and fifteen thousand dollars, of which ten thousand dollars, or so much thereof as may be necessary, shall be expended in snagging and other work between Tehama and Redding, on the Sacramento river; and, in the discretion of the Secretary of War, ten thousand dollars, or so much thereof as may be necessary, shall be expended in making a cut-off to avoid Shanghai bend on Feather river: Provided, That no money shall be expended in making said cut-off until the right of way therefor shall have been conveyed to the United States free of expense.

Improving San Joaquin river, California, including making cut-off at Twenty-one Mile Slough; and if, in the discretion of the Secretary of War, it is deemed beneficial to navigation by preventing deposit of sediment in Stockton channel or otherwise, the making of a double cut-off, beginning at Mormon Slough, immediately above its junction with Stockton channel, thence across the same, entering the San Joaquin river immediately below junction therewith of Stockton channel; continuing improvement fifty thousand dollars, of which ten thousand dollars, or so much thereof as may be necessary, shall be expended in snagging and other work in aid of navigation on the San Joaquin river, above the city of Stockton and in the Tuolumne river and other tributaries of the former: Provided, That no money shall be expended in making said double cut-off until the right of way therefor shall have been conveyed to the United States free of charge.

Improving Petaluma creek, California: Continuing improvements, fifteen thousand dollars.

Improving Mokelumne river, California: Continuing improvement, two thousand five hundred dollars, including snagging as far as county bridge at Thornton's, on said river: Provided, That no part of said sum shall be used until the drainage canal cut by private parties near New Hope landing shall have been closed.

Improving Napa river, California: Continuing improvement, four thousand dollars.

Under Section 10 of the act the Secretary of War is directed to cause preliminary examinations to be made at the following localities in this district:

San Joaquin river above the mouth of Stanislaus river, with a view to improvement, including closure of sloughs to a height sufficient to maintain current in main channel during low water period.

Feather river, above Marysville.

American river, with a view to prevention of sand flowing into the Sacramento river, near the city of Sacramento.

Steamboat channel, and from junction thereof with Sacramento river to mouth of said river, with a view to improvement, enlargement of navigable channel, and to increase capacity for flood discharge.

Suisun creek, with a view to improvement of channel.

Discussing the gold mines of the Republic of Colombia, and the failure of foreign companies, Don Vicente Restrepo says that often those failures are due to preventable causes: "In general, they enter upon their undertakings overburdened with fictitious capital divided among promoters, commission agents and stockbrokers; often they fail to take into consideration the special conditions of the country. They begin by sending out a multitude of officials and workmen, spendiug much money in salaries and the expenses of journey and maintenance. Once established in the district, these men frequently become exacting, take to drinking, and are a constant source of embarrassment. Moreover, the companies do not consider that our roads are narrow, broken up, and everywhere difficult to traverse, and that only light loads can pass over them; but they send out heavy machinery, whose massive pieces are doomed to lie rusting on the banks of our rivers. Such masses of iron, mute witnesses of disasters due to want of foresight, are frequently met with. Sometimes costly buildings are put up regardless of all expense. There is an instance of a foreign manager who arrived with a store of wines and preserved foods, and built himself a house full of conveniences in a desert region; when his foreign provisions came to an end he took his departure. We have known instances of engineers sent out here who could not handle a prismatic compass nor distinguish ores one from another, much less assay them. In this way millions of dollars have been squandered by foreigners on mining undertakings which, managed with judgment and economy, would have turned out well."

The Nevada Silver Convention platform declares for free silver, denies the right of the United States Government to pass laws restraining the privilege of any citizen to the free coinage of gold and silver into standard money at the legal ratio of 16 to 1, independent of any other nation, and demands the repeal of all laws denying such right.

Buying Gold Dust.

This has been an exceptionally active season among the placer miners, says the Spokane, Washington, *Spokesman-Review*, and as a result a great deal of gold dust finds its way to the banks and buyers of Spokane. William Nelson buys several hundred dollars' worth a day. "In a few days," he said yesterday, "the receipts will be much larger. The last three months of the year are always the best. In October I have bought as high as $5000 worth of dust in a day."

While the reporter was talking with Mr. Nelson, a man came in with a bag of gold. It weighed $142, and he took his check and went away happy. "This gold," explained Mr. Nelson, "comes from the Columbia river, and was mined by Chinese. You can tell by the color. It is yellower than the gold retorted by the white miners, who have not the knack of retorting that is possessed by the Chinese. Where does it come from? No one can tell. I only know that it is Columbia river gold. Ask the Chinamen who bring in the dust, and they give evasive answers."

The gold was in retort lumps from the size of a pea to one as big as a walnut. It has a porous appearance, and lacks the impressive weight of a natural solid nugget. Some retort gold brought in by white men during the day was quite dark and rusty, and had more the appearance of old iron than of the precious metal.

The successful buying of gold dust is an art iu itself. The Chinese, and often the whites, are up to tricks, and besides some of the retorted gold brought in carries a large percentage of quicksilver. Mr. Nelson, from long practice, has grown adept at passing on the value of gold. He breaks up the retort lumps, puts a file here and there on a nugget, and promptly sets the true value of the "dust."

Most of the gold brought here comes from the Pend d'Oreille and Trail creek placers, though a great deal comes from the Columbia and Snake rivers and from the Cœur d'Alenes. The Pend d'Oreille gold is in flakes aud small nuggets and the Columbia river dust is as fine as flour.

While the reporter was standing by the scales, Dr. Elmer came in with some fine dust in a vial which he had bought while on his visit to his Columbia river ranch. Some men are rocking the sand just across the river from his place, and one of them persuaded Dr. Elmer to take this little lot of dust in order to give him some ready money for a sack of flour. He estimated its value at $2, and the doctor, who is not expert at buying gold dust, thought there might be $1.50 worth, and paid that for it. It weighed exactly one pennyweight, and Dr. Elmer lost just 70 cents on his transactiou.

Every Wednesday a Spokane woman brings in from $30 to $32 worth of gold which her husband rocks out somewhere in the surrouuding country. She makes complaint that six ounces of gold sent her by her husband through the mails has never put in an appearance at the Spokane office.

Personal.

R. W. Miller, of Del Norte, has hought a giant and pipe enough to bring water 600 feet, and will work his mine on Smith river.

Congressman Caminetti, recently renominated on the State Democratic ticket in the Second Congressional district, declines the nomination.

L. W. Getchell, who has filled the position of superintendent for the Nowell Gold Mining Co., and the Berner's Bay Mining and Milling Co., Alaska, since April, 1893, has resigned his position and gone to bis home in Seattle.

J. E. McGrath and E. F. Dickinson are back from Alaska, where, as assistants of the U. S. Coast and Geodetic Survey, they have each been in charge of a party surveying the houndary hetween Alaska and British Columbia. The remainder of the expedition will sbortly arrive, the work being completed.

B. Petropavlosky, in charge of the construction of the Siberian railroad, is here from Siberia, via Yokohama, on his way to St. Petersburg to report on the progress of the undertaking on wbich he is engaged. On the way he will study the railroad systems of this country and Europe with a view of collecting information to be used in his own work.

Obituary.

Gen. Geo. Stoneman, ex-Governor of California, died at Buffalo, N. Y., on the 5th inst., aged 72.

The executive, advisory and finance committee of the State mining exhibit at the Midwinter Fair held a final meeting last Wednesday, closed up all their business and adjourned *sine die*. After paying all bills and satisfying all claims, there was a surplus of $1500, which was turned over to the California State Miners' Association.

The original intent was to hold the annual convention of the California State Miners' Association on October 10th, but it is thought the meeting may be deferred till after the November election. At a meeting of the executive committee to be held uext Monday, the exact date of the convention of '94 will be decided upon.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XII

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894 by Henry G. Hanks, F. G. S.

1884.—There were at least twenty producing gas wells near Pittsburg. Before the introduction of gas 3,000,000 tons of coal per annum were used in Pittsburg. A single gas well produced the equivalent of 1200 tons of coal per day.

Up to this date meters were not used in Pittsburg and the loss from carelessness or unskillful use was very great. When they were introduced, the price of gas was fifteen cents per thousand feet. Pipe lines were laid from the gas wells at Murraysville and Tarentum to Pittsburg.

The value of natural gas used in the United States during this year was $1,460,000.

1885.—The gas mania reached its height. Pipe lines similar to those used to conduct petroleum were laid from the producing gas wells to the manufacturing centers at a distance.

The value of the coal replaced this year was $4,857,200.

1886.—There were 300 miles of pipe from 6 to 24 inches in diameter conveying natural gas to consumers. The value of gas used was $10,012,000.

1887.—The consumption of gas was valued at $15,838,500.

1888.—About this date symptoms of a decline in the production of gas began to appear. Consumers were required to pay 22½ cents per thousand—all paid for by meter. No large manufactories were supplied even at that price, and there were other indications of a failing supply; yet the value of the gas consumed in that year was estimated at $22,629,875.

1889.—The most productive gas well ever known was struck near Bellevernon, 26 miles from Pittsburg. The daily yield was 40,000,000 cubic feet, under a pressure of 800 pounds to the square inch.

1890.—A gas well was sunk at Newton Center, Lackawana county, Pennsylvania, which promised to prove of great importance.

1893.—Notwithstanding the repeated statements that the supply of natural gas was decreasing, the following was telegraphed to San Francisco and published in the city papers:

FINDLAY (O.), September 12.—All previous records in gas wells have been broken. This morning D. T. Davis completed a well on the Ross Farm in Cass township, which is good for 50,000,000 cubic feet per day, making it the largest well ever struck in the world. The well is but 60 feet from the city's 19,000,000 "gusher," struck two months ago, and the greatest excitement prevails. Scarcely had the "go devil" struck, than the well responded with a hiss and a roar such as has never before been heard.

The rush of the gas from the tapped reservoir was awful, and the gauge placed over the well showed it to be beyond measuring. The indicator shot up to the 25,000,000 mark and then stopped, for it could go no farther. The well has a larger capacity than this. It has been estimated at from 25,000,000 to 50,000,000 cubic feet.

Natural gas at the surface of the earth is not sufficiently abundant to play an important part in human economy, but obtained by artificial means from a considerable depth, it has become an important factor in many industries and has added very materially to the wealth, comfort and conveuience of mankind. Its use has been principally confined to the United States, its consumption in China and elsewhere being comparatively unimportant.

When, as has been shown, one locality after another with bewildering rapidity began to yield vastly more gas than could be utilized, the ingenuity of man was taxed to its utmost to overcome difficulties arising from ignorance and want of experience; before this was accomplished much of the precious fuel was forever lost. When it first began to be known it was considered more a curiosity, a strange natural phenomenon, than a matter of economy and use. At first it was so cheap in the United States that street lamps were allowed to burn day and night, but after a time more care was taken of the supply. Explosions were common from the escape of gas in cellars, but accidents are now rare owing to better management.

In Pittsburg at one time natural gas replaced 10,000 tons of coal daily, and changed that city from one proverbially sooty, to one of the cleanest in the United States. Bradford, an oil and gas center in McKean county, Pennsylvania, is now populous and prosperous. The wells are sunk to a depth of from 2000 to 3000 feet, to what are technically called the third sands. At first the gas was allowed to go to waste for two reasons, one that its value was unknown, and the other because it was found impossible to control it; the great pressure could not at first be overcome.

The waste of gas has been enormous, when we consider that some wells produce 30,000,000 cubic feet per day. Fears being entertained that the escaping gas might engender disease, it was thought best to ignite it and keep it burning. To accomplish this a firebrand was thrown toward it. It was sometimes more conveniently ignited by a burning paper at the end of a long fishing rod, or by shooting fire balls from a Roman candle. When it was found that the gas was valuable, every effort was made to control it, and to check the waste. When a cap with an open valve was screwed on the top of the well pipe, and an attempt made to close it, sometimes the casing was blown out of the ground. The pipes in gas wells specially drilled for that purpose are now two inches in diameter, inside measure, of welded wrought iron, screwed together by sockets like ordinary steam or gas pipes.

When the use of natural gas had reached its maximum, it was enormously consumed in manufactures. In Pittsburg it was used for all purposes formerly supplied by coal except smelting of ores in blast furnaces, in which it failed. It was specially used in iron work and in the manufacture of glass and pottery. The Crescent Steel Works of Pittsburg is reported to have used 30,000 cubic feet of gas per hour in mechanical puddlers producing blooms equal to 2240 pounds every twenty minutes. Iron made with gas is purer than when coal fuel is employed, owing to the absence of sulphur, carbon and phosphorus. The principal consumption is in the manufacture of glass. One hundred and fifty-five pots are employed in making window glass. The growth of Findley, Ohio, was stimulated by giving gas to manufacturers practically free for a time. The Karg well—the principal one—yielded 2,000,000 cubic feet daily. In the Eastern States, natural gas was, and still is, extensively used in dwelling houses. A grate filled with broken brick receives the gas, which soon raising the fragments to a red heat, produces a fire resembling, and equal to, one made of the best anthracite coal, which requires but little or no attention or care. Some consumers fill the grate with other substances, such as furnace slag and even cast-off porcelain door knobs.

Large manufactories are supplied by meter. In Ohio, in 1890, an inch pipe was brought to a dwelling, conveying gas sufficient for all domestic purposes, both for lighting and heating, at a cost of $40 per annum. There was no limit to the amount that might be used, except the size of the supply or service pipe. In Pennsylvania the charge for supplying cooking stoves was from $3 to $4 per month. Gas is supplied to grates and heating stoves for from $2 to $3 monthly, and to grates and ranges by an inch pipe; the flow is regulated by a globe valve. Imitation wood of pottery ware or iron is sometimes laid in parlor grates and pierced with holes from which the issuing gas jets burn. In 1888, at and near Pittsburg, an ordinary dwelling house was supplied with gas for $60 by the year; the most elaborate at a cost not exceeding $125. This is about one-half the cost of coal. For convenience the gas is far superior.

To control natural gas at first seemed to defy the ingenuity of man. All not consumed was of necessity allowed to escape. The regulator system, by which the flow was modified, consisted of pipes and valves, a portion or all of which could be opened or closed at will, and by careful attention or management a considerable portion could be saved. An attempt was first made to anchor the pipes or hold them down by bracing them from trees, to prevent them from being blown bodily out of the ground. These rude appliances were followed by iron platforms or flanges riveted to the pipes, on which stones were piled or masonry built. It was found that by making everything strong and the pipes small, the gas could be entirely shut off when required; and by experience it was learned to sink a number of wells near each other, and when the gas was flowing from all with diminished pressure they attached globe valve cut-offs to the pipes, one by one, after which they closed them gradually, in succession, and stopped the flow at will. This was a great triumph. It is a cause of regret that such great quantities of the best of all fuels should have gone to waste before this could be accomplished. Gas was led in branch pipes to street lamps and to places where it could be utilized, long before it could be shut off and retained in the pipes until required.

Pipe lines were laid to cities and manufacturing centers. They were from twenty to fifty miles and upward in length. The average line pipes are from five to eight inches in diameter. They are generally buried four feet underground, to prevent freezing and accidents. Several or many gas wells discharge into these conduits. One pipe line near Titusville has 100 wells "blowing" into it. No gasometers are used, for the volume of gas produced by the wells and consumed is so great that it would be impossible to store it. The conduit and delivery pipes vary from three to thirty inches in diameter. The sizes most used are from six to eight inches. George Westinghouse Jr. invented a system of pipes to collect and convey leakage gas from the main pipe lines. They were parallel to the conduit pipes, and the gas was burned from convenient lamp posts or allowed to escape into the air from elevated exits.

(To be Continued.)

Interests of the Silver Miners.

A correspondent of a Georgia exchange writes: "Do you think it is fair to give the silver mine owners increased prices for their silver by means of free coinage?"

A brief question, squarely put. We shall try to answer it briefly and squarely. It would not be fair to increase the value of silver in the interests of the mine owners alone—indeed it would be rank injustice. But the mine owners' interests in the matter are infinitesimal when compared to those of the people at large.

So far as the exchange value of their silver is concerned, the mine owners have lost nothing whatever by the demonetization of the white metal. An ounce of silver would buy a bushel of wheat in 1873; it will buy a bushel of wheat now—perhaps a little more; it would buy sixteen yards of calico in 1874; it will buy sixteen yards of calico now—and so on through the list. The demonetization of silver has affected the mine owners precisely as it has affected other producers—no more, no less. They have to give for a gold dollar twice as much of the product of their capital and labor—which is silver bullion—as they gave in 1873; but the gold dollar will not pay a cent's worth more debt now than it did twenty years ago. That is the whole story in a nutshell.

In South Africa.

Chas. Hunt, a former Comstocker, is back from Johannesburg, South Africa, and to the *Examiner* says that the lay of the land, the color of the soil and sky, and the temperature reminded him of the San Joaquin valley, with the exception that there are no mountains in view. There is a curious outcropping of pebbly quartz for forty miles along the dead level country. This is the famous cropping known as the "reef" in that country, and which we would call a ledge. It is on this that the great gold mines have been discovered. The ledge tips downward at an angle of about thirty-five degrees. In one place the ledge has been reached by a shaft 900 feet deep from the surface. The other shafts and workings are of various depths.

For the ordinary man I do not think the country about Johannesburg promises any better than this country, but experienced mining men and certain mechanics can do very well. Managers of mines get on the average $500 a month, foremen $250 and shift bosses $5 a day. Bricklayers, carpenters, masons and mechanics get about $7 a day, and clerks about $3.50 or $3.75. There is a demand for skilled mechanics. As for the actual mining work, that is all done by Kafirs, who work much cheaper than the average intelligent miner can.

Living expenses are considerably higher there than here, so that a man who goes there must keep busy or his expenses will eat up what he makes.

There is a demand for American timber for the mines. The timbers they get are small, usually only three or four inches through, and are worth twenty-five cents a foot of length measure. They have to be put in a mine pretty thick to sustain the weight. The Oregon and Puget Sound timber is just what is wanted there. It can be taken to that country and sold for $25 a thousand feet at a profit, and it now brings as high as $60.

There is a great deal of interest in Matabeleland. The new town of Bulawayo, 400 miles from Johannesburg, in Matebelaland, is only a few months old and now numbers 3000 men, with more going in all the time. Most of the men there are Americans. They have good "reef" there already and they call it the Pacific.

It takes a man about a month to find out whether he likes the country or not, and usually at the end of that time he does. Most of the people are English and Dutch. Their ways and, to some extent, their dress are different from ours and it takes a little while to get accustomed to the change. Even Johannesburg, the center of the gold fields, is a very moral place. All the various denominations of churches are represented, and not a saloon in the place is open on Sunday. The Johannesburg authorities are very strict about that.

Complimentary Notices.

A whole page could be filled with complimentary notices of this paper. A few are appended. We are glad to elicit such mention and hope by care and effort to merit their continuance:

Leading Mining Journal.

The MINING AND SCIENTIFIC PRESS of San Francisco has entered upon Volume LIX and appears in an entirely new dress. The PRESS is the leading mining journal on the coast and should be well patronized. It is as handsome a paper as any printed in the State.—Nevada City Transcript.

Most Valuable.

That most valuable exchange, the MINING AND SCIENTIFIC PRESS, appears in an entirely new dress. We are pleased to see this evidence of prosperity in the PRESS. It is the leading mining journal of the coast, and its prosperity is well merited.—Oroville Mercury.

A High Standing.

The MINING AND SCIENTIFIC PRESS has entered upon a new volume and celebrated the occasion with a clear and attractive new dress. This paper has attained a standing among mining men of the Pacific coast that only a true and honest devotion to mines and mining matters could bring about. Its mining reports and illustrations of mining appliances are striking features of this publication, and it circulates information of importance to large mine-owners as well as the lonely seeker for the hidden treasure. Long may the MINING AND SCIENTIFIC PRESS continue to prosper is the wish of the *Record!*—Amador Record.

A Valuable Publication.

The MINING AND SCIENTIFIC PRESS of San Francisco, one of the most valuable publications on the coast, has lately assumed a new dress. Its last issue contained a summary of the progress and position of the mining industry of the State. We constantly regret that our preoccupation with other subjects prevents our devoting the study that we should like to do to the contents of this paper.—Los Angeles Commercial Bulletin.

Scientific Progress.

Electrolysis of Buried Pipes.

In order to ascertain exactly what takes place when gas and water pipes are destroyed by return currents from trolley systems, Professor D. C. Jackson of the University of Wisconsin has been conducting unique experiments. He took a number of cells and filled each of them with a weak solution of some salt usually found in the soil of city streets. He then sent currents from a battery through the various liquids, using iron electrodes, or terminals, on the immersed wires. He experimented chiefly with nitrates and chlorides of ammonia, potash and soda, but also with other salts. He found that corrosion of the anode—that is, the terminal by which the current left to enter the fluid—always ensues. The cathode, or negative terminal, was unaffected. There was usually a deposit of the disintegrated or oxidized iron, not close beside the damaged electrode, but about half way between the two.

His interpretation of the facts is this: The soluble salt is first analyzed, and the acid in it then attacks the anode, while the alkaline base unites with water to form a hydroxide at the cathode, liberating hydrogen there. The iron salt produced at the anode is dissolved, and diffuses itself, and so does the hydroxide. Where they meet they unite and form a ferrous hydroxide, which is precipitated. He finds the activity of the chlorides, nitrates and sulphates to be in the order in which they are here named. Carbonates are without noticeable effect. Although the composition of street soils is more complex than the electrolytes of these experiments, the former contain the same salts, and must lend themselves to the same change.

The widely observed and oft-reported destruction of gas and water pipes has invariably occurred, so far as could be discovered, at the points where the mischievous current was leaving the unauthorized metal route, which it had adopted in preference to the prescribed one; and from this it has been inferred that operation was electrolytic, but it has never before been the subject of such careful investigation as in the present instance. Professor Jackson shows the correctness of that supposition, sheds light upon the method of the transaction and also proves that a minute quantity of the salt and a very low voltage are sufficient to set up chemical action, which, once begun, continues as long as any current is flowing.

Sympathetic Vibration.

The well-known phrase of Dr. Chalmers, "The power of littles," is strikingly illustrated in the physical world by the phenomena we are about to study. Little forces acting in the same direction and recurring at rapid and regular intervals of time will, if accumulated, soon add up to a single force of gigantic magnitude. Every one has heard how a regiment of soldiers, when crossing a suspension bridge, have to break step, lest the uniform tramp of their feet should set up as it might well do, a dangerously large oscillation of the bridge. A half-hundredweight hung up by a wire may be thrown into a considerable swing by a succession of gentle taps, or even puffs of air, if the taps or puffs hit the suspended body at the right moment, that is, when the feeble impulses conspire in the same direction with that of the swinging weight. To give definiteness, imagine the wire supporting the half hundredweight to be rather more than a yard long, the time taken for the weight to make a single swing in one direction will then be a second; the arrangement will be in fact a second's pendulum.

Let us now attach one end of a fine thread to the weight and every second give the feeblest possible jerk to the threads. We shall soon find that a surprisingly large swing of the pendulum is to set up, because the gentle impetus we have given synchronises with the period of the swinging weight.

The trivial amount of enegy in each pull is stored up in the weight, so that if we now attempted to stop the oscillations of the weight by a single pull of the thread we could not do so, as the thread would break. In fact, if the half hundredweight be swinging through an arc which measures a foot across, it will be moving with an average velocity of a foot per second, thus possessing a momentum equal to a half-ounce bullet moving with a velocity of nearly 1800 feet a second—more than sufficient to kill a man. All this energy has been transmitted through a thread an infant could break, and has accumulated in the weight owing to the succession of tiny jerks coinciding with the peroid of the pendulum.

A common swing illustrates the same law, for a swing is nothing more than a long pendulum. At the right moment the child in swinging gives a push with its foot or an impulse in the right direction, by bending its body forward so as to throw the center of gravity in front of the seat of the swing, and the addition of these small forces soon creates a wide excursion of the swing to and fro. In like manner, a heavy lever watch hung from a hook will, after the lapse of a little time, often be found vibrating in accord with the movement of its balance wheel.

DR. JOULE'S STUDIES in mechanical equivalents of heat brought forth the compound engine. In 1850 it required 14,500 pounds of coal to transport a ton of grain to Europe. Now 350 pounds will carry a ton. An inch cube of coal will carry a ton of cargo two miles. In 1880 the cost of carrying a bushel of grain from New York to Liverpool was 18 cents; in 1886 it cost two cents.

A SPECIAL MOUTHPIECE for public telephones is being introduced in Germany with the object of avoiding the spread of diseases carried by condensed moisture of the breath. A pad or a large number of disks of paper, with a hole in the middle, is inserted in the mouthpiece, and the upper disk of the paper is torn off after every conversation.

ELECTRIC MELTING of metals, notably cast iron and steel, as produced by a new Germau process, is said to have some very great advantages. In crucible steel the new process shows an economy of fuel of more than half, which, for metal so difficult of fusion, is a favorable result.

HORSESHOES made of papier mache have been introduced into Germany, and are said to give satisfaction. It is predicted that in a few years they will take the place of iron shoes wherever horses are shod.

Decline in Use of Brimstone.

During the last two years there have been exported from England considerable quantities of recovered sulphur, amounting, in 1893, to 12,700 tons, which has displaced just as much of the Sicilian product. This has been principally used by manufacturers of wood pulp, for which it is peculiarly adapted by reason of greater purity. It is probable that the use of recovered sulphur will increase and that, therefore, the demand for crude brimstone will be further affected.

It is estimated that the consumption of pyrites in the United States last year aggregated over 200,000 tons, which is equivalent to over 100,000 tons of brimstone. Thus it will be seen that 112,000 tons of brimstone were replaced last year, which, had this amount been drawn from Sicily, would have reduced the stock on hand to 37,000 tons, a very small amount. With the ever increasing use of pyrites and of recovered sulphur the outlook for the brimstone miners in Sicily is not encouraging.

THE deepest gold mines in Australia are the Magdala, at Stawell, 2400 feet, and Lansell's, at Sandhurst, 2640.

Mechanical Progress.

Flight by Steam Puwer.

Engineering, of London, publishes an account of the actual flight of a flying machine, constructed by Hiram Maxim, and driven by steam. The machine weighs, complete, 7700 pounds. There are two screws 17 feet 6 inches diameter revolving 400 turns a minute and giving a total thrust of 2000 pounds. Each of these screws is driven by a compound engine. The boiler weighs 1000 pounds, carries 200 pounds of water, and develops steam for 300-horse power. The fuel is gasoline, which vaporized and burned in several thousand jets. There is an aeroplane with 1400 square feet surface, besides which there are other wings that assist in sustaining the weight, but, like the aeroplane itself, have no independent motion. The machine is an experimental one made to run upon a track, and with another track above designed to hold the machine down or prevent it from rising freely. During a trial which occurred July 31st this upper track failed by the bending of an arm carrying a wheel and the machine rose but quickly came to grief through not being designedly and properly launched. Three men, including Mr. Maxim, were upon it at the time, and the result showed that a machine carrying its own fuel, boiler and engines can fly by sheer exertion of energy.

Electrical Muscle Making.

Some recent scientific researches, which the *Electrical World* says can doubtless he trusted, show that the weight of muscles of animals was increased forty per cent hy the proper periodic application of an electric current, the growth being a true development of the muscle. According to this it will now he possible to increase to order size of any desired muscle without tiresome gymnastic exercises, by simply lying in a soft chair and having the current applied. This, we suggest, might be done at night by an automatic apparatus, thus saviug time. Persous who are improperly developed may now be balanced or "trued up;" muscles shrunken by age may now he made plump again. Calves, which nature or exercise has failed to develop sufficiently, will now no longer be a drawback to wearing knee breeches, or the short bloomers of the female hicyclist. The question naturally suggests itself, What will happen if this process of developing muscles electrically is continued still longer? If some way is then found to develop the hones, the manufacture of giants by electrical means will be an easy matter.

IT IS AFFIRMED hy a Continental contemporary, which ought to be a reliable authority on such a subject, that we shall soon have the surprising novelty of aluminum stockings put ou the market. It is said that hy some special procedure, which of course is kept secret, aluminum is mixed with the yarn without any injury to the flexibility of the material or any interference with the customary method of working it up. In the first instance only the heels and the toes will be dealt with, as they need to he doubly strong.

W. A. EDDY'S experiments with tailless kites at Bayonne, N. J., last year enahled him to reach an altitude of 5460 feet; hut attempts are now being made at the Blue Hill Observatory, near Boston, with similar kites, with which it is hoped to attain an elevation of 10,000 feet. Mr. Eddy used nine kites, flown taudem, the series combining to sustain a greater weight of cord than one kite could lift.

A GREAT DEAL of ornamental hardware for huilding purposes has been stamped or embossed with a die, the articles being made out of sheet metal. Bronze has hitherto heen used almost exclusively, hut now steel is being treated in the same way. This is cheaper than casting, and allows greater freedom of design, although the scheme has its limitations.

A LAMP WICK of clay, which is indestructible and which gives twenty-five per cent more light than cotton, is said to be a recent triumph of inventive genius. In addition to the natural scarcity of the material, capillary qualities are given to the wick by incorporating vegetable fiber with the clay while soft and then burning the filaments out in the baking.

Ancient Gold Miners.

The Incas of South America are among the most ancient of gold miners. The amount of gold and silver produced by them is amazing. Atahulapa, the last of their chiefs, bribed Pizara for release from prison by offering to fill with gold, as high as he could reach, a room 22x17 feet. These Indians were very successful mining engiueers. Many of the canals and sluices constructed by them for use in hydraulic mining still exist in Peru and show surprising ingenuity. Many of their copper mining tools have also been discovered. For washing the metalliferous dirt they employed a so-called "batea," or wooden pan, differing from the miner's "pan" of Arizona only in having a conical bottom, at the apex of which the gold was collected by dexterous handling. These Indians were also acquainted with the process of collecting gold by quicksilver riffles.

The Amazon Indians used a dugout canoe, its bottom fluted with transverse grooves. This they tipped on end, turned ou some water, and theu rocked it to and fro, gathering the gold in the grooves and at the bow of the hoat. These antique tools and mining works were displayed in the South American sections or in the archæological division of the main miuing display at the World's Fair. The rich mines of gold and silver in the mountains of Mexico have been worked since prehistoric times by the aucieut Montezumas. Their process of treating the ores survive to the present day. The ore is packed to the reducing establishment, called haciendas, is assorted and then pulverized in the arrastra. This consists of a large round vat, like a mortar, with a grinding arraugement consisting of three granite stones of an obloug shape. These are tied to a pole, conneeted with au axle, and turned by a mule walking around in a circle hlindfolded.

The somewhat famous "patio process" was inveuted by Barthlome de Medina, a Mexican miner, ahout 1551. Within two centuries it was generally used throughout Mexico and theu adopted in Europe, only to be replaced by more modern methods. The process derives its names from the patio, or yards, at the mouth of the mine where the operatiou is usually conducted. The pasty mud taken from the arrastra mills is thrown upon a hard stone floor, and after heing filled with quicksilver and salt, is called soup. After undergoing evaporation for several days, the mass is stirred up by the feet of horses aud men until it is well mixed, when it is called cake or mud. The amalgamated silver is washed and then placed in canvas bags.

The mercury is squeezed out by pressure and the residual silver is purified in a furnace and then run off into molds. Mexico still furnishes some of the old-fashioned Catalan forces for iron making with their crude hammers and water blasts. Catalonia was a province in Spain where this antique implement was first employed, and from which skilled ironmongers were exported to the uew world. In New Mexico and Arizona the Aztec mines, worked hy peons hundreds of years ago, are still to be found, and in the State of Sonora Senator Tahor of Denver lately purchased aud reopened one of these known from early history as the Santa Maria or Holy Mary. These mines extend northward to the Colorado line and some of them are very rich.

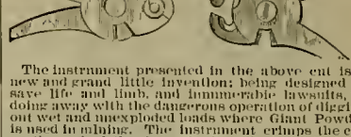
GIANT POWDER FURE CAP FASTENER.


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.
MOODEY & SHERWOOD Fresno, Cal.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes wherof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very destrable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expellents; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price **$1.00** postpaid. Sold by **The Dewey Publishing Co.**, Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, **$1.75.** Sold by **The Dewey Publishing Co.**, Publishers, 220 Market St., San Francisco.

California Inventors Should consult DEWEY & CO. AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CONSIDERABLE STIR.—*Record:* There is considerable stir in mining affairs in and around Plymouth at present and the people there are looking forward to the dawn of better times very shortly. The rumor is current that the Ivanhoe mine has been sold to San Francisco parties. Several men are at work in the Little Giant mine and the prospects of this property are said to be encouraging. Sinking in the Pioneer is going on both day and night and the owners feel well satisfied with the process that is being made. At the New London work is being pushed ahead at a rapid rate and the future of this mine will surely bring good results to the shareholders. It is said that an English company is negotiating for the purchase of the Alpine mine.

MINING NOTES.—*Ledger:* Knight & Co. have the contract for the Argonaut hoist. It is to be completed in seventy-five days.

The Alma mine, which recently suspended operations, is running again. The work of shaft sinking is being pushed as rapidly as it can be with three shifts daily.

Calaveras.

MINING AT WEST POINT.—Angels *Herald:* A large load of machinery has been brought up for the Mattie mine.

At the Wide West a large air-blower has been placed in position. About twelve tons of high-grade ore are now on the dump. A trial of the ore is now being made at the Lockwood furnace.

Superintendent Oliver of the Blazing Star is expected daily from San Francisco. Twelve men are at work in the bottom of the mine taking out ore and doing improvement work. The best of the rock is being shipped below to be treated, while the free-milling ore will be milled at the mine. Large tanks are now being erected to supply the mill with water. The mill will be ready to start in a few days.

A very rich strike was made in the Lone Star mine last week. It is said that a four-teen-foot vein was uncovered.

THE BURNEY MINE.—The Burney mine will be in operation inside of six weeks. A mill of ten stamps capacity is now being built. The shaft is down 135 feet and the ledge is fifteen feet wide. The Burney is located one mile northeast of town.

PUSHING AHEAD.—At the Calaveras Con. mine, located at Robinson's Ferry, work was suspended on the 400 level Tuesday owing to a falling off in the water supply. It is decided to concentrate the entire work of the mine for the present on the 500 level, in which quarter the prospects are quite encouraging. It is believed that by the time the water supply regains its normal flow this level will be sufficiently developed to keep the mill running steadily on good paying ore.

El Dorado.

THE GRAND VICTORY.—*Republican:* At the Grand Victory mine they have had twenty stamps of the mill running for some time on ore from the mine, putting through the loose surface at first, and more recently working the solid formation of the ore body underneath. The gold has been saved successfully by amalgamation on plates and even with this small plant the operators claim that it is paying. They are proving their faith in the mine by making preparations to remodel and reconstruct the mill. All the old timbers and other work are being torn out of the lower half of the mill preparatory to running the entire forty stamps the mill now contains. Eight concentrators will be put in as soon as additional stamps are ready for operation and the owners expect to eventually increase the capacity of the mill to one hundred stamps if their present favorable prospects continue. The concentrates will be reduced by the cyanide process, extensive preparations for which have already been made.

Nevada.

ENGLISH MOUNTAIN.—*Telegraph:* The people who are operating the English Mountain mine are now putting "things into shape" up there. The mine is located about six miles above Bowman's Dam. The ledge is four feet wide and the mill test of the ore is something wonderful, if reports he true. Some crushings went as high as $80 per ton. The company, organized hy Jas. Holsworth, are mostly Chicago people, and they are now hauling in 1000 tons of machinery aud a large amount of lumber, all coming hy way of Emigrant Gap, as that is the nearest point of approach. The company is building a 20-stamp mill, and the tramway from the tunnel to the mill will be half a mile in length. There are now 75 men on the payroll, and in a short while a great many more will he added. The company have a property in the English Mountain claim which they may he proud of.

EIGHTY-FIVE DOLLAR ORE.—Joseph Floyd & Co., who have for a short time past heen working the Cal. R. Clarke mine near the old Half Mile House, have about thirty tons of ore on the dump. The Pioneer Reduction Company has offered them $60 a ton for it at the mine, hut they refused to sell, as they are confident it will yield at least $85 a ton. Of course they can haul and work it for considerahly less than $25 a ton. The ledge is not large, hut is clearly defined. The present working is at a depth of about 100 feet on the incline, and there is much water to contend with.

Placer.

IOWA HILL—*Sentinel:* The Morniug Star and Harmon mines are working about 50 and 40 men respectively and are both doing well.

The work on the tunnel in the Juno claim is heing pushed forward as rapidly as the hard rock in the tunnel will permit.

Two other tunnels are heing run in claims south of the Morning Star mines. One of these has struck good prospects and the other has good indications of striking gravel in a very short time.

NEVADA.

Washoe District.

The following is from the weekly official letters of the superintendents:

CON. CALIFORNIA AND VIRGINIA:—In continning the work stoping in the ore body to the west and south and upward to the 9th floor—one floor above the sill floor of this level—we have extracted during the week 350 carloads of ore—ahout 317 tons—the average assay value of which, per mine car samples, was $63 25 per ton. The stopes look well.

On the 1700 level—22 feet below the south drift No. 3—the south drift has heen extended 10 feet, in ore which will average $70 per ton; total length of drift 66 feet; face in porphyry and quartz assaying $30 per ton.

1000 level—The north drift from the crosscut run west from the bottom of the winze—down 28 feet—which was sunk on the east side of main drift 280 feet south from the shaft s tation, has heen advanced 15 feet; total length 50 feet; continuing in a porphyry and quartz formation of a low assay value.

The west crosscut started from the main drift, 345 feet south from the shaft station has heen advanced 20 feet; total length 230 feet; continuing in porphyry and quartz.

All work on this level and all work carried on hy the Con. Virginia Company through the Con. Virginia shaft has heen suspended.

Have shipped to the Morgan mill during the week 103 tons and 130 pounds of ore, the average assay value of which (per railroad car sample) was $43.16 per ton. The average assay value (per hattery sample) of all the ore worked at that mill during the week (362 tons, 810 pounds) was $55.86 per ton.

Bullion shipped to the Carson Mint—assay value—$86,029.46.

OPHIR.—1465 level—The upraise started at a point 70 feet in from the mouth of the east crosscut started from a point in the main north drift 124 feet north from the main east crosscut from the Ophir shaft, has heen carried up 12 feet; total height, 45 feet; face in porphyry, clay and quartz of low value.

Have continued jointly with the Mexican Company the work of makiug repairs in the main shaft, at the 1100 level.

Central Tunnel—The old winze, which was reached at a point 220 feet in from the mouth of the crosscut run west from the north drift from Mexican shaft on the tuunel level has been reopened down 6 feet; total length 24 feet.

The drift running north from the end of the west crosscut, 56 feet above the tunnel level, which had heen advanced 90 feet in that direction, has been extended 5 feet; total length in a north course, 95 feet.

WEST CON. VIRGINIA & CALIFORNIA—During the past week we have been engaged in repairs at the station and the north drift. The west crosscut run from a poiut 320 feet north of the 1100 level station, has been extended 16 feet, and the material run through is a favorable nature, and is composed of quartz, lime and feldspar some of which assayed in gold per ton, $276 and in silver $2.50. The crosscut is now in a total distance of 1146 feet. The face is in the same material as that above described.

MEXICAN—1465 level—The west crosscut started from the top of the upraise which was carried up 45 feet above the sill floor of this level at a point 40 feet west from the main north drift and 100 feet north from the south line of the mine, has been extended during the week 23 feet; total length, 351 feet. Face in porphyry, showing fine lines of quartz.

As joint work with the Ophir Company, are making repairs in the Ophir shaft on the 1100 level.

BEST & BELCHER—750 level—East crosscut No. 1, started from upraise No. 1 from 800 level, has been extended 19 feet through hard quartz and porphyry; total length, 61 feet.

200 level—The west crosscut No. 1, started from the incline upraise, 50 feet from 200 level, has heen extended 20 feet, passing through porphyry and stringers of quartz; total length 62 feet. It has heen discontinued. We are now running a drift from this upraise, whicb is now out 12 feet in quartz.

UNION MINE.—900 level—The Union Con. and Sierra Nevada joint north drift, which was run from the joint west drift, at a point 1520 feet west of the shaft—has heen extended during the week 16 feet; total length, 669 feet; face in hard porphyry. The joint south lateral drift from the joint west drift, at a point 1520 feet west of the shaft, has heen extended 24 feet; total length 287 feet; face in porphyry.

HYLE & NORCROSS.—975 level—Advanced north drift 13 feet; total length 50 feet; face in porphyry.

1100 level—North drift on this level was advanced 12 feet; total length 66 feet; face in quartz and porphyry.

ANDES.—420 level—The north drift from the top of the upraise from west crosscut has heen advanced 8 feet, connecting with the north upraise. We are easing timhers in main north drift on 420 level.

GOULD & CURRY—200 level—The south drift from west crosscut No. 5, 1115 feet from the northwest drift, has been extended 25 feet; total length, 240 feet; face in soft prophyry, clay and hunches of quartz.

Ferguson District.

Captain DeLamar is sinking an eight-inch artesian well to get a water supply sufficient to run the new 100-ton per day chlorination mill now building. He will sink to a depth of 3000 feet. Should it fail to develop a sufficient flow of water for reduetion purposes, a plant will be put in to pump water from Meadow valley wash. When completed this mill will work on the ores of the Monitor-Jim Crow group and the Ferguson district generally.

Kennedy District.

New Era: Tbe vein in the north drift of the winze in tbe Imperial has increased to five feet of ore, and last Thursday the men on night shift broke twenty cars of ore with two shots. Tbis ore body is said to he from 120 to 200 feet in length and pitching to the northwest. Men are heing put on in all parts of the mine to stope ore, sixty tons of which must be daily furnished the mill.

THE STEPTOE VALLAY. White Pine *News:*—The recent gold discovery made near W. D. Camphell's ranch in Steptoe valley, ahout twenty miles from Ely, is a very promisiug prospect. The ledge averages ahout four feet in width and is traceable for over a mile. The rock is a white quartz and averages ahout $20 in free gold.

OREGON.

BAKER AND GRANT COUNTIES.—*Democrat:* C. Rimhold, near Fort Sumpter, has leased his ground to a Chinese company, from which he receives $200 per week for each pipe. Sloan & Haskell made a partial eleanup ahout the first of July, and hrought $11,000 to the bank at Baker City as the result. Much of this gold ranged in size and sbape like grains of corn, hut there were many pieces weighing from $100 to $485. Last year tbey took out one piece that weigbed $1200, and their entire output was $26,000. This year they expect to take out at least $36,000. On the north fork of the John Day, in Klopp & Baisley's mine, which in the past has yielded over $210,000, two giants are kept going ten hours each day, and a double output would result from double work, but Klopp says: "What's the use? I get as much out as I need, and get more time to sleep."

Adjoining Klopp ahove the extensive property just incorporated under the name of the Granite Gravel Mining & Ditch Company consisting of a ditch 15 miles long, taken from the North Fork, carrying 500 inches with its present capacity, but the owner owns 2000 inches. They have located 840 acres of miuing ground and have a No. 1 giant at work, and the ground prospects well everywhere. Captain A. Tyler, of Portland, is in charge of the work of this company, and has enough virgin ground in sight to keep four pipes going for many years. They have 96 feet fall from bulkhead to giant, with ample dump, and the gravel is decomposed quartz and granite, free from cement, and is easily cut with a pipe.

Democrat: The gold discovery of Harahan and Heady in the Mable district promises to be one of the best properties in that vicinity. The owners have done considerable developing work on the property. They uncovered the apex, showing a 16-inch vein; then they sunk a shaft 30 feet deep, showing a 16-inch vein; then they sunk a shaft 30 feet deep, showing a well developed vein of 32 inches. They drove a tuunel 170 feet down the hill, going in 135 feet, striking an immense ledge seven feet in width of rich decomposed ore which runs from $25 to $3000 per ton. The owners are now drifting north on the ledge 125 feet; upraise to surface, uncovering the ledge about 100 feet.

IDAHO.

OSBURN.—All the mines on Canyon creek except the Black Bear and the Mammoth are at work, and the latter, it is said, will start up to-day. Nearly as many men are now working in Canyon creek as ever worked there at any previous time. The sampling works hetween Oshurn and Wallace are running two shifts, and much ore is going out direct to the smelters without undergoing the sampling process. California capitalists are looking over some Osburn prospects. It is reported they have made an offer for the Columbia, St. Elmo and California claims of $50,000, agreeing to pay $5000 cr its equivalent in work within a year from signing papers.

A BONANZA.—It seems probable, says a Boise letter, that Idaho will soon have another mine equal to the Delamar. This is the Tip Top, in Florida monntain, at Silver City. Though in a mountain long famous for rich mines, the Tip Top is an entirely new property. The owners have heen prospecting the ground for a long time. Recently they discovered the ledge and exposed 13 feet of ore worth about $20 in gold and $5 in silver per ton. The property looked so well that it attracted the attention of Colonel G. V. Bryan, the Wood River mining man. He bonded it and has since heen developing it. The original discovery was made at a depth of 50 feet. The shaft has now heen sunk to a depth of 100 feet. At this depth the ore hody is 10 feet thick and assays $217 per ton, ahout three-fourths of the value being in gold. The vein is said to closely resemhle the Delamar lode.

GENERAL NOTES.—The Silver City *Avalanche* reports that the Lincoln mill is being reconstructed to run on ore from the Tip Top mine, which was recently bonded hy G. V. Bryan.

Pierce City has heen thronged all spring and summer with adventurous gold-seekers, there being at one time 300 men in the camp. Little, however, has been or is heing done, and the travel out is ahout as great as that going in.

E. B. Lemmon, of Duluth, who has heen examining quartz and placer claims in Idaho county, has gone East. He took with him some gold from the Secesh creek placers to show prospective investors. From four pans he secured twenty-five cents. He says some wonderfully rich quartz ledges have heen discovered recently near Warrens.

The DeLamar *Nugget* says: Some of the most heautiful specimens of silver ever seen in Idaho or elsewhere were taken out of the DeLamar mines this week. They consist of masses of pure silver in the form of leaves aud moss. The leaves and sprigs are so delicate and fragile that the hunches will scarcely bear handling. They are as white and hright as burnished silver. There were several pounds of tbese heautiful specimens in the "bug" or crevice.

North Idaho *Star:* Another attempt to save tbe fine gold of the Clearwater river by a patent process has just resulted in failure. A party secured the right from the Indians to mine a har a few miles below Kamai, on the middle fork, and hauled in the machinery, including an engine and hoiler. After a two weeks' run the cleanup showed $14 in gold, certainly small pay for the seven men who were at work. Further work has been abandoned, a dollar a week heing too small pay even in the prevailing hard times.

THE CŒUR D'ALENES.—Helena *Herald:* Every day hrings some encouraging news from the Cœur d'Alene country, writes a correspondent. The latest reports are to the effect that all of the leading properties are being worked, affording employment to 1000 miners and half that many timbermen, office employes and others. The Gem employs 155 men and ships forty tons of concentrates daily. The Standard has forty-five men and an output of ten tons; the Helena & Frisco, 120 men and thirty tons; the Mammoth, twenty men and five tons; the Poorman, 200 men and forty-five tons; the Tiger, eigbty men and twenty-five tons, and tbe Bunker Hill & Sullivan, 350 men and fifty tons.

Other mines are said to be preparing to start up, and unless there is some material change in the situation there will soon he between 2000 and 3000 men at work, nearly as many as in the lively days of the camps of that section. If, as is reported, the other mines resume operations the following properties will be soon worked: Hunter, Morning, Black Bear, Custer, Sierra Nevada, Last Chance and Stemwinder.

WASHINGTON.

SLATE CREEK PLACERS.—Harry Green came in from the Methow Wednesday and reported that a rich placer strike bad heen made on Slate creek. Four men, he says, are taking out $75 a day with rockers, says the Okanogan *Outlook*. They are obliged to carry the dirt about 100 yards to water, which is supplied from tbe melting snow and is available only about four or five hours a day.

This is the placer ground reported by Mr. Yeargin last fall. The discovery was made while prospecting for a quartz ledge. Rich float was found along the creek and side of the mountain, and traced up for several hundred feet, when it suddenly ceased. Naturally the boys hegan to prospect for the lead where the float gave out, and after sinking through about six feet of "wash" found it. The ledge proved 19 feet wide and rich in gold. In testing and sampling the rock the boys made the discovery that a great deal of the gold had heen leached out of the ledge and deposited hy the action of the water in the gravel helow. There is where they have made the rich strike reported.

$3,000,000 TO DEVELOP IT.—Charles M. Fassett has returned from a ten days busines strip to the Monte Cristo mining district on the west slope of the Cascade mountains. He brought hack a numher of ore samples for assay.

"It is a wild and rugged region," he said to a Spokane reporter. "To visit the different properties one has to cross great snowfields and glaciers, scale mighty cliffs, and in places pull himself up with the aid of ropes. The town of Monte Cristo has about 500 inhahitants.

The Standard Oil people—Rockefeller, Colby, Hoyt and others—have put in there already more tban $3,000,000 of which $2,000,000 has gone into the railroad from Everett to Monte Cristo, $300,000, into the smelter at Everett and $200,000 into the concentrator near the mines. Their judgment in this gigantic undertaking is now to he put to the test. The hig mill has begun to concentrate, the smelter started Wednesday, and the work of taking out the ore is expected to go steadily forward. The company is prepared to ship from two mines—the Mystery and the Pride of the Mountains. It owns about 20 claims, hut these are the only ones upon which extensive development work has heen done. From these they are taking 200 tons of ore daily. The ore is chiefly arsenical iron, carrying gold and silver and some galena and copper pyrites.

"The outcome of this vast undertaking turns entirely upon the grade of the ore and the cost of its treatment. They unquestionahly have gigantic deposits, and if the ore can be mined, milled and smelted even at a narrow margin of profit, the results will justify the undertaking."

MONTANA.

DEER LODGE COUNTY.—*Mining Area:* The most extensive placer mining in the county is tbat carried on hy Joel P. Catching at Bearmouth. Mr. Catching started up his new flume this summer. It contains 100,000 feet of lumher. Up to within a few weeks ahout sixty men were employed on this placer. It is expected that Mr. Catching will clean up ahout $40,000 this season.

SILVER BOW COUNTY.—The Anaconda mine was sold to Daly & Haggin in June, 1881, for $30,000 hy the Hickey Bros., and was considered a doubtful proposition then. In September of 1882 the St. Lawrence, an adjcining property, was sold for $162,500. These two properties, which a little over ten years ago sold for less than $200,000, are now considered second only in amount of ore produced and value of any in the world.

All of the outside properties of the Butte & Boston are closed down with apparently little encouragement for their starting up this year.

COLORADO.

CRIPPLE CREEK MINES.—The great Pike's Peak is in honanza now. The vein in the second level has widened to fully two and one-half feet. Through this hody are streaks of ore that assay fully 100 ounces of gold to the ton.

It was the general opinion two months ago that tbe Pharmacist had been worked out. During the strike, when closed down, practi-

cally every miner that had been employed there was free to say that there was not a carload of smelting ore left standing in the mine; but 186 sacks of ore have been sent from this property that will average $100 in gold to the sack. This was all closely selected. No more ore will be hoisted from the Pharmacist for some time, owing to differences between the owners.

UTAH.

MERCUR DISTRICT: THE GEYSER.—The negotiations pending for the erection of a mill on the Geyser have been successfully closed. Messrs. S. B. Milner and G. H. Bothwell of Salt Lake have secured a half interest in the property, and will move the Milner fifty-ton mill from Bingham. The Geyser is one of the finest properties in the district. The ore averages between $8 and $10 per ton and there is lots of it. A small leaching plant has been operating successfully on its ores for some time. This enterprise will give the camp a new impetus.

NEW MEXICO.

EXCITEMENT AT BLACK MOUNTAIN. *El Paso Times*: A private letter from Black Mountain says that a new excitement, "on the side," came near depopulating the gold camp proper for a few days, and the fever is still raging. The new discoveries lie along the base of the range between San Agustin ranch and Baylor Pass, and some of the veins are traceable from one to two miles, are of workable size and carry gold, silver and lead in payable quantities at or near the surface. This is the region "ruled with an iron rod" (Winchester) last spring by the masculine gluatess of Aztec descent who kept all prospectors out as long as she remained there. A few prospectors have been at work there for the past five weeks, and the showing made by this development work caused the rush of Tuesday last.

HANOVER DISTRICT. *Enterprise*: A company of Colorado and eastern capitalists have taken a lease and option upon the Ivanhoe mine. They are sinking a large well below the mine and if a sufficient supply of water can be developed a large smelting plant will be erected and the mine worked to its full capacity for production of ore. The ore body in the mine is over 20 feet in width and averages 20 per cent copper and about $8.00 per ton in gold and silver.

The Southwestern Coal and Iron Company are shipping 50 tons of iron ore perday to the Pueblo smelters. When New Mexico iron mines can enter into successful competition in a market nearly a thousand miles away, it makes a good showing for the quantity as well as quality of the ore and is a prophetic indication of the future importance of the mines when the ores can be reduced and utilized at home, as they will be in the near future.

MEXICO.

SILVER-LEAD ORE.—Three hundred cars of silver-lead ore were standing in the railway yard at Ciudad Juarez, Mexico, toward the last of August, waiting for the new tariff bill to go into effect before transferring to the United States. Many Mexican silver-lead mines which closed down on account of the Windom ruling will now be opened up again. A decline in the price of lead will cause a number of mines to close down in the Rocky mountains.

Mining Slate.

The manner in which slate is mined and cut up for the purposes to which it is applied is a process that is known to only a few people, because slate is not found in many places in this country, its principal sources being in upper New England and eastern Pennsylvania. It is not taken out of shafts, but it is quarried out of big holes in the earth. At Bangor, Pa., these quarries are about 200 feet deep. The slate is blasted out in huge blocks and is hoisted out by steam and turned over to the men who know how to reduce it to the proper size. Huge blocks of it are taken in hand by these workmen, who cut a notch into one end of each piece. Then they take a chisel and a mallet, and they are so skillful in directing their blows that they can split the blocks of slate in almost any way they please. If one should watch the slab on which one of them is working, he will see a little hair line running through it, and presently the block will fall apart on either side of this mark. The workman will make this line go straight through the middle or to either corner just as he likes. He invariably accomplishes what he sets out to do.

The smaller pieces thus produced are taken in hand by another set of men, who split them up into sheets of the proper thickness for roof slate. This they do with a long-bladed instrument about the shape of a putty knife, but many times larger, and it is a marvel how they get the sheets off without breaking them and also how they could split them so thin. Some of these men can take a sheet of slate only one inch thick and split it thirty-two times. The usual number of divisions is sixteen. These sheets are taken and cut into squares by machinery.

Coast Industrial Notes.

—For the first six months of '94, 95,000 M ft. of pine and 55,000 M ft. of redwood were received here.

—For use in the gold mines of Johannesburg, South Africa, the Puget Sound fir is leading all others.

This year 3,000,000 acres in California are devoted to wheat raising, with an estimated yield of 30,000,000 bushels.

There is a mine of asbestos in Fresno Co., Cal., near Dry creek, which, developed, would be of value in the industrial arts.

—A year ago hops were 24 cents a pound. Three months ago they brought 17. Now they are slow of sale at 8. Overproduction!

Electricity is entering more into the motive power of San Francisco street railways. Trolley wires are now going in on Third, Kearny and other city streets, and an electric line to the ocean is projected.

—The ditch to be built across the Yakima, Wash., Indian reservation will tap the Yakima river five miles below Yakima and run eighty miles, putting about 150,000 acres of good level land under water. The survey for the definite line of location is being made.

—Recently G. J. Perkins, of Truckee, invented a water-tube boiler for locomotives. He has organized a company at La Crosse, Wis., with $800,000 capital, to manufacture it. He says it will save 25 per cent in fuel, and that properly used no fire gets through the smokestack.

—The firms of J. W. Grace & Co. of San Francisco; Grace Bros. & Co. of Lima and Callao, Peru; Grace & Co. of Valparaiso, Santiago and Concepcion, Chile; W. R. Grace & Co. of New York, and M. P. Grace of London have consolidated all their interests under the firm name of W. R. Grace & Co.

—An advance of $1 is reported in the price of fir logs on Hood's canal, now selling at $6. British Columbia mill men were reported finding more profit in buying logs on Puget Sound than in operating their own mills. Since July 1st 5,000,000 feet of logs have been shipped from Sound ports to Vancouver.

—The California Jute Mills have closed down, and the $250,000 plant is idle, it being considered useless to compete with free grain bags. Prices are considered settling to a level with Eastern figures; in the East prices are supposed to be settling to a level with those of Europe: in Europe prices are believed to be going to an Asiatic basis. Asia is still unheard from.

THE Government bounty on California beet sugar has been abolished; the Government agents are withdrawn. The three California companies think this is in the nature of a breach of contract. It was stipulated in the law that the bounty should be paid till June 30, '95. Over $2,000,000 was invested in this State in the beet-sugar business on the strength of that agreement, and the investors think they have just cause for suit in the Court of Claims at Washington.

—The fisheries of the State of Washington, including the production of oysters, clams, etc., amounted in 1893 to $1,106,226.25, as follows: Columbia river salmon, $626,071.75; Columbia river sturgeon, $77,635.50; Puget Sound fish, oysters, etc., $321,705; Willapa and Gray's Harbor, $89,814. Twenty-two coal mines in the State produced 1,208,850 tons of coal during 1893. The total value of real property in the State, exclusive of railroads, is $227,201,095; total valuation of personal property, $41,165,560; live stock, horses, 171,518 head, valued at $5,192,986; cattle, 206,372, valued at $2,980,845; sheep, 290,021, valued at $580,042; hogs, 53,487, valued at $187,211; a total live-stock valuation of $8,941,084. Telegraph, telephone and electric lines are valued at $600,891. Cable, horse and electric railways at $720,694. Steamboats, sailing vessels, etc., $1,015,721. Washington has 2824 miles of main track railway, valued at $17,286,246, and 317 miles of side track, valued at $665,131. The total acreage of timbered lands in the State is 23,588,512; feet of standing timber, 410,333,335,000; stumpage value, $269,561,329.

THE Bucyrus Steam Shovel & Dredge Company report business satisfactory both in volume and character, and state that they are running their large works at South Milwaukee, Wis., full time with full force on orders. They have lately received orders for shovels from the Messrs. McArthur Brothers Company, duplicating their previous order for the largest and most powerful steam shovel ever built either in this country or abroad, from E. D. Smith & Company, Wilson & Jackson and others. The prospects with the company for an excellent fall and winter business are very bright.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Gold Quartz Mine For Sale.

A Good Quartz Mine, near Scott Bar, Siskiyou county, is offered for sale. Parties wishing to invest in quartz-mining property will do well to examine this ledge, from the extension of which ten-dollar rock is now being crushed. The average width of the ledge is two feet. For further information, call on or address W. A. CHAMBERLAIN, Yreka, California.

STANDARD ELECTRICAL DICTIONARY.

By Prof. T. O'CONOR SLOANE.

Author of "Arithmetic of Electricity," "Electricity Simplified," Etc.

The "Standard Electrical Dictionary" is what the work purports to be, exhausting the subject of electrical terms, giving each title the clearness of explanation necessary to make the understanding of it complete, without unnecessary elaboration. In this work every electrical word, term or phrase will be found intelligently defined.

The work is absolutely indispensable to all in any way interested in electrical science, from the higher electrical expert to the every-day electrical workman. In fact, it should be in the possession of all who desire to keep abreast with the progress of the greatest science of the times.

624 Pages. 350 Illustrations.

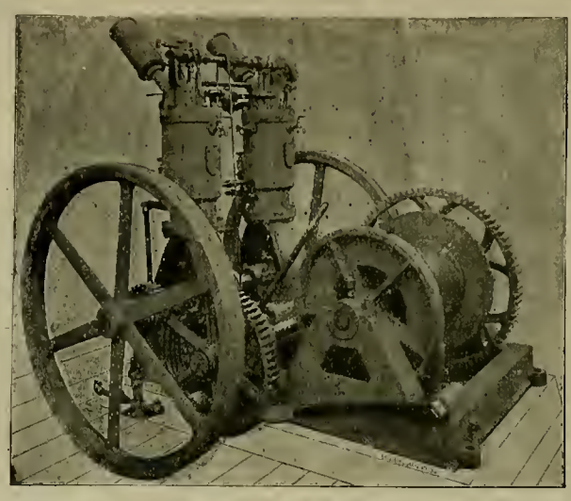
Handsomely Bound in Cloth, 8vo. PRICE, $3. Extra Super Calendered Paper.

What is said of the STANDARD ELECTRICAL DICTIONARY.

The dictionary gives evidence of a large amount of painstaking work on the part of the author, and possesses features which must be commended. Among these, the author, wherever occasion required it, has furnished the synonyms of terms, and the book is given an additional value by an alphabetical index, which enables it to be consulted for terms both collectively and individually. The work will prove of value to the reader, whether professional or non-professional. The definitions are put tersely and concisely, so that the inquiring reader can carry away a defined, net impression as to what is meant. Any student who will spend his leisure hours over the volume will be amply repaid for his time and trouble. The book is very clearly printed in bold type on good paper, and is well bound.—*N. Y. Electrical Engineer*

Sent Postpaid on Receipt of Price.

MINING AND SCIENTIFIC PRESS,
220 Market St., San Francisco, Cal.



The Golden Gate Gas Engine

is not a new comer, but has not been advertised in the papers as some others. If you are in need of a Gas Engine, just ask anyone whoever had anything to do with them, and they will tell you:

Get the Golden Gate.

USES GAS or GASOLINE.

For a Cheap, Compact and Reliable Hoisting Outfit correspond with

Adam Schilling & Sons,
211-213 MAIN St., San Francisco,

The "GOLDEN GATE" is made strictly according to its own Letters Patent issued.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

Built solely by the

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
South Milwaukee, Wis., U. S. A.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 22 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies. Stamp Cam.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."

SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.

First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE.....Grass Valley, Nevada County, California.

Electrical Progress.

Electrical Voltage.

A New York reporter recently got an interesting talk from Nikola Tesla. In answer to a question from the interviewer as to what he hoped to see accomplished by means of electricity, Mr. Tesla said: "You would think me a dreamer and very far gone if I should tell you what I really hope for. But I can tell you that I look forward with absolute confidence to sending messages through the earth without any wires. I have also great hopes of transmitting electric force in the same way without waste. Concerning the transmission of messages through the earth, I have no hesitation in predicting success. I must first ascertain exactly how many vibrations to the second are caused by disturbing the mass of electricity which the earth contains. My machine for transmitting must vibrate as often to put itself in accord with the electricity of the earth."

When asked if he did not feel a little worried about taking a current of a quarter of a million volts, Mr. Tesla said:

"I did at first feel apprehensive. I had reasoned the thing out absolutely; nevertheless, there is always a certain doubt about the practical demonstration of a perfectly satisfactory theory. My idea of letting this current go through me was to demonstrate conclusively the folly of popular impressions concerning the alternating current. The experiment had no value for scientific men. A great deal of nonsense is talked and believed about 'volts,' etc. A million volts would not kill you or hurt you, if the current vibrated quickly enough—say half a million times to the second. Under such conditions the nerves wouldn't respond quickly enough to feel pain. You see, voltage has nothing to do with the size and power of the current. It is simply the calculation of the force applied at a given point. It corresponds to the actual pressure per square inch at the end of a water pipe, whether the volume of the water be great or small. A million volts going through you doesn't mean much under proper conditions. Imagine a needle so small that the hole it would make in going through your body would not allow the blood to escape. Imagine it so small that you couldn't even feel it. If you had it put through your arm slowly, that would be, electrically speaking, a very small voltage. If you had it stuck through your arm with great rapidity, going, say, at the rate of a hundred miles a second, that would be very high voltage. Voltage is speed pressure at a given point. It wouldn't do you any more harm to have a needle shot through your arm very rapidly—that is to say, with high voltage—than it would to put it through slowly. In fact, if it hurt you at all, the slow operation would probably hurt more than the other. The question of danger is simply the size of current, and yet if a big enough current should be turned against you and broken with sufficient rapidity—if it should, so to speak, jerk back and forth an inconceivable number of times to the second—it wouldn't kill you. Whereas, if applied continuously, it would simply burn you up."

THERE exists a general and deeply rooted idea that direct current dynamos of very high potential are not at all practical. This unfavorable opinion is particularly strong in regard to the use of such machines for the transmission of power for any considerable distance—in fact, such a system is considered to be almost out of the question. The actual historical and practical facts are that the high potential direct current machines were more extensively and successfully operated when the dynamo first came into general use about 1880 than any other type, either direct or alternate. Furthermore, their number and size have largely increased, and the voltage at which they can be practically worked has been steadily raised, until we now have sixty light dynamos as the standard size of large machines generating about 3000 volts and 10 amperes. Arc dynamos of ninety-light capacity are also regularly made by several manufacturers, and 120 or even 125-light machines are built and used.

THE Boston *News Bureau* quotes a large stockholder in the American Bell Telephone Company as follows: "There is actually invested in this country, either from invested capital or accumulated earnings, $90,000,000 in telephone plants. This does not earn seven per cent, and does not pay five per cent. The Bell Telephone Company, as the parent company, protects all the junior companies, makes all experiments, and, like the senior member of a mercantile firm, naturally obtains the larger proportion of earnings. The Bell Telephone will probably never consent to have its new shares sold by auction. It may wait and appeal to the new legislature, or it may go out of the State."

AN electrician compares the relative efficiency of electricity and the cable for power transmission in the following manner: A steel cable 1½ inches in diameter, traveling 12 miles an hour, can transmit nearly 2000 horse power. A copper wire with a section of one square inch will carry an electric current of 10,000 volts, at 1000 amperes to the square inch, and such a current is now being transmitted in this country. This is equal to 13,000 horse power.

Faster Transportation.

Elevated electrical railroad trains mounted upon the single steel rail of a bicycle railway may yet be whizzing through Philadelphia between Washington and New York at the marvelous rate of 120 miles an hour. Although a majority of the House Judiciary Committee recently made an adverse report upon the application for incorporation of the National Rapid Transit Railway Company, a minority report, lacking only one vote of a majority, has been drawn up in urgent advocacy of the granting of the desired charter. This report declares that Congress would only be following an old precedent in taking out of the hands of the States through which the proposed railroad would pass the authority needed. If left to the various States the ambitious scheme would probably be defeated, for both the commonwealths of Pennsylvania and New Jersey require a majority of the directors of a railroad chartered in either of those States to be residents therein.

There is nothing startling in the mechanical principles which would be involved in the construction of this contemplated railroad. There is now invested in the United States in electric roads capital exceeding $205,000,000. The bicycle plan has been successfully operated on a minor scale. It is the vastness of this enterprise that almost staggers belief. That the motion of a train running on a roadbed of iron or steel with a single rail in the center and side rails reaching under the sills of the car windows in a trough-like fashion might be very much smoother and safer than the present track system does not seem unreasonable, and is, at least, worthy of thorough investigation and trial. The center of gravity would be upon the supporting rail; the pointed cars would minimize the air pressure, and the gearless electric motors would greatly diminish the friction. The railroad of to-day would seem to have reached the limit of its speed possibilities. With this proposed roadbed and rail principle 120 miles an hour might be only the beginning of a new era of racing ahead of the wind.

WITHIN the past twelve months the price of silver per fine ounce has declined over 14%. The price of leather has declined in about the same ratio, pig iron about 13% and wool about 17%. In the price of these commodities the decline has been in about the same proportion as that of silver.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Selby Smelting and Lead Company,

416 Montgomery Street, San Francisco.

Gold and Silver Refinery

—AND—

Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of
